I previously had objections to committees, on the grounds of impracticability and slowness, but here we see an efficiency of evil, without so much as a vote or a discussion, perhaps without design. And let me ask the liberals, who sigh over such a state of things, what they do to counteract this backward tendency? It is not for want of wealth or knowledge that they are inert. The charitable explanation is, that, abhorring such effects, and perceiving that the old mysticism is always, verbally at least, found united therewith, they fly off to the other extreme, and will acknowledge no interior origin of life and growth whatever. Hence our modern liberal schools, as the Mechanics' Institution, the London University, and their imitators, are one-sided affairs. They profess to make a home for every means calculated to promote human good, yet leave the pupils without help where they most require it, that is, in the consciousness of the sources of their individual feelings and affections. From the days of Sheridan, or before, until now, the liberals have talked ardently of a University for Females, but the priest will always carry the question against them, so long as they reject the supremacy of the moral feelings, and make a monarch of the intellect. The result of such defects, on either side, is, that both sexes are ill educated for each other, and not at all for the end of education. It is in vain to appeal for progress to men who are bound to stand still by money profit, as well as by opinion. The hope is with the liberal-minded. To them I would say, continue to reject the old mysticism, with all its verbiage, forms, and cant, as the derelict of a past age, but do not in that act throw out of mind those functions and natures of the human being, whose wants are supplied, though defectively and injuriously, by such means. Erect a new mysticism, uniting in one comprehensive whole, the human feelings, intellect, and organization. There are real inward as well as outward phenomena. No individual exists, who would not assert the truth of some interiorly originating realities, yet the prevailing intellect of the day, taken collectively, denies their existence altogether, and tries to erect a superstructure of *learning*, without due regard to the foundation of *being*, whereon they propose to build. Now the affections are so much larger in the female than in the male mind, that no educative scheme can at all comprehend them, which does not regard the moral spontaneity as the primary object of the teacher's care, and females must continue to fall into the ranks of superstition, as hitherto. I purpose, therefore, another week, to consider the subject of National Education, to be attained through a development of the female portion of the rising generation.

This is, I perceive, rather a gossiping letter, but familiarity may sometimes assist the discussion of principles. C. L.

[Gossiping though it be, it is a better letter than the last. Jesus Christ taught by parable, *i. e.* gossip. Æsop taught by gossip, and both taught with effect; they are read to this day—but Plato never is read, except by learned logicians, word-philosophers, ascetics, anchorites, and such as never have, and

never can, while God exists, have much social influence on their fellow-men. We advise C. L. always to write in this style, and for every *single* sentence of philosophy, or mysticism, put down *seven* sentences of gossip. The great defect of many good men and shrewd mystics is, that they are nothing but mystics; they do not study the art of gaining access to the heart. For this reason they are doomed to oblivion; they live in society as if they did not belong to it; they represent its evils as *inward*, and therefore neglect the outward means of removing them; and although they are so inconsistent as to use speech, by making sounds with their *outward* mouths, they contrive to modulate those sounds in such a way, as that no man, who is not previously of their own party, can possibly receive them. They are too inward. Philosophy, and wisdom, and religion, and virtue, are twofold, inward and outward. The neglect of the former makes a hypocrite—the neglect of the latter makes an anchorite. The two combined make the perfect man. We know some men, who might be very useful to their fellow-creatures, were they merely to dip two or three hours a-day into the newspaper gossip, collect facts, scientific and social, and mount their mystical axioms on these *slings*, and throw them amongst the people. The people would then *stir*. How strange it is, that men either go to one extreme or another! There is nothing so difficult as temperance; abstinence is comparatively easy; but to tread the middle path of wisdom is as difficult as to cross the *single-hair* bridge of Mahomet, that spans the mouth of hell, and leads into heaven.—ED.]

A TALE, SHOWING THE WAY TO KILL SATAN.

BENEDICT and Beatrice were very comfortable for a week after marriage; but all at once, Benedict became uneasy, and ceased to fondle and dote upon Beatrice. What was the cause of this, think you? It was the merest trifle in the world. Beatrice had a rather vulgar habit of picking her teeth after meals, and sucking them with a sharp noise. Benedict could not bear this, and he was ashamed to tell his partner of it. He thought he would overcome it. He reproached himself for his weakness. He called it an evil spirit. He said that God would not like Beatrice the less for this habit, and why should he. He resolved to bear it; but the resolution was too great for Benedict. His nervous system was shaken. He brooded over the offensive subject; he was always enforcing his resolution, always keeping a check upon himself; and the only result that he perceived was this, that he could not accomplish his purpose. He gave way at last, became fretful and disagreeable, and Beatrice perceived, to her great grief, that she had lost his affections, and that all her attempts to please him by kind words, pleasant looks, and assiduous attention, only served to make him more irascible and indifferenced.

Benedict had a friend, to whom he resolved to communicate his grief; but he blushed deeply at the thought of revealing such a trifle. However, he kept his resolution, and, to his great surprise, he found that his friend had been tormented in a similar manner. "And how did you get over it?" said Benedict; "you must have more virtue than I, if you could subdue such a feeling. I am afraid that I have got a bad habit, and that the wicked one has enthroned himself within it." "Ha! ha!" roared his friend, "ha! ha! the wicked one, forsooth! What think you, my friend, if, instead of being a fiend, it is an angel of light?" "Angel of light!" said Benedict, "to make me unhappy, and divide my affection from my spouse—you chaff me now." "Not a bit," said his friend, "you must consider whether the habit you allude to is good or bad, graceful or ungraceful. If your judgment approves of it, as good and graceful, then I say you have a devil; but if the habit be ungraceful and bad, how can you call that a devil, which is merely a spirit of refined feeling, which cannot bear an offence against propriety. It is said of God that he *hates evil with a perfect hatred*; and it is, in my opinion, the character of every refined feeling to do the same, and to persecute offensive habits until they are eradicated." "Then you do not think the evil is in me," said Benedict. "Your hatred of the offensive habit," said his friend, "is not evil, but you

are to blame for concealing the cause of your disaffection, your wife is entirely ignorant of it. She would instantly remove the offence if she were aware of it; the angel would be pacified, and that which you now think a devil, would prove only a schoolmaster for you both. Suppose, my friend, you were very much troubled with fleas in bed, and could not sleep, and you were to take some metaphysical notion into your noddle, that the tickling and restlessness were merely inward feelings, the effect of a principle of evil in your spiritual nature, and, instead of endeavouring to catch the fleas, and get rid of them by outward means, you were merely to speculate on the spirit of evil in your own heart, as the main and sole cause of all uneasy sensations, and resolved to apply the remedy within by an *a priori* process, beginning not at the fleas, which caused the tickling, but at the sensitive soul, which perceived the sensation, how long do you think, Mr. Benedict, you might lie among the fleas before you got rid of the uneasy feelings?" "Ha! ha! ha!" said Benedict, "very good! I see you are right. There is an inside cause and an outside cause for every condition. The inner cause of my uneasiness is my sensitive mind, the outer cause is the offensive habit of my wife; but the blame is at present in my concealment from her of the cause of my unhappiness. It was pure shame that prevented me from complaining; I am now resolved to mention it." He did so. She was astonished—she begged his pardon—she embraced him twenty times over, and tenderly reproached him for his want of confidence in not revealing the secret before; and from that day thenceforth the loving couple renewed their loves, she rejoicing in the recapture of her husband's affections, and he in the possession of a delicate and affectionate partner, who, having once discovered his weak side, took care in future never to offend it.

"Now," said his friend, many years after, "how do you get on with your devil, have you killed him?" "No," said Benedict, "I have converted him. It was a very simple process. What a fool was I to suffer so long when so complete a remedy was in my own power?" "Ah!" said his friend, "it is so with a thousand other evils of life; a thousand other devils which priests in vain attempt to exorcise, and spiritualists in vain attempt to subdue. There is no killing the devil of society, but by removing the materials in which he appears. If you want your house clean and tidy, you wash it, and sweep it, and ventilate it; if you want a clean person, you wash, and powder, and put on clean clothing, you then feel comfortable to yourself, and agreeable to others; but should you say, "oh! outward cleanliness is beneath my notice, I am spiritually clean," and you suffer your house to become filthy, and your person abominable; you not only become yourself uncomfortable, but you arouse the devil in every one that comes near you. They abominate your house, they nauseate your person, and they go away and revile you to their acquaintances as a disgrace to human nature. In like manner may we explain every other social evil. They all arise in outward things impressing the sensitive mind with strong sensations, which lead to hatred, slander, strife, theft, and murder. Every one of these devils may be exorcised in the very same fashion as you have exorcised your own, only some are manifested on so large a scale, that they would require a nation to combine to put them to the rout."

THE TRANSCENDENTALIST'S DIALOGUES.

No. IX.

ON "THE ONE."—(Continued from p. 70.)

Transcendentalist.—*Materialist.*

Trans.—Now, I conceive, our dialogues have assumed an important aspect; we have, in a popular manner, said the same things that Kant has said in his *Antinomie of pure Reason*.

Mat.—What? We have not been talking Kantism all this time?

Trans.—Not precisely; our arguments have occasionally differed from those of Kant, but yet we have proceeded on the

same principle, and on certain points we have gone* quite as far as he has.

Mat.—But I thought Kantism chiefly depended on a certain table of categories.

Trans.—Well, and when it is convenient we can soon drop down into those categories. That "oneness" of apprehension—that "one" to which we are obliged to bring all objects, may be called the category of categories, being much higher than the Kantian category, called "unity," and inclusive of that, as Kant himself has expressed. However, we will, perhaps, talk of the Kantian Categories hereafter. Do you remember the progress of intellectual apprehension, in the case of visual phenomena?

Mat.—Perfectly. We suppose a mass of unapprehended sensible phenomena lying before us; to make any one an object for the understanding, we, as it were, mentally draw a line about it, and separate it from the rest; the power by which this is done may be called the imaging power. We afterwards make a stop, and that which is separated at this stop is *one* object, this power of stopping is the understanding. And, indeed, the understanding seems to be little more than a store-house for the creations of the imaging power. I have a symbol for this (though, of course, as all symbols are, an imperfect one). Suppose that a man is picking up sand, and throwing it into a variety of boxes; when each box is full, a certain quantity of sand, and no more, is brought to a mass. Now, the man who collects appears to me to perform the function of the imaging power, while the boxes, which, though inanimate, as it were, command that so much, and no more, shall be a mass, appear to me to perform that of the understanding. And, by a little extension, we may include the consideration of other phenomena, besides those merely visual. Suppose a person surrounded by a beautiful prospect, and listening to a flute, and suppose the charms of the music are so great as to make him forget those of the prospect; though a man cannot be said to draw a geometrical line between a sound and a picture, yet he does that which is similar,—at first his eyes, and his ears, are occupied by a mass of sensations, he now separates them, and makes the sounds alone his object. In common parlance, this would be called *attending* to the sounds, and we may, if we please, call the compound act of object-making "attention." Thus, suppose there is a figure painted on a white ground, it is the same whether we say you make an object of the figure, or you direct your attention to it. If you attend to the peculiar beauties of the figure, you, as it were, exclude the ground; if, on the other hand, you are criticising the whiteness of the ground, you exclude the figure.

Trans.—Your views and mine on this head, are precisely the same. And now let us consider the result of our former dialogues. We have, in fact, been considering finity and infinity—finite and infinite division—finite and infinite addition. And now observe the curious predicament we are in: finity is not enough to satisfy our imagination, infinity is too much. Let us take this bit, and imagine it divided a thousand times, the understanding can readily apprehend these multifarious divisions, but is the imaging power here satisfied? No! It would add another division, and another, and another, give it in the first instance as large a number as you please—and yet infinity is too much for it; the synthesis will never be complete. The same may be said of infinite addition; there is no number so large, but you may conceive one added to it—and yet it is impossible to conceive an infinite number. Here Kant stops.†

Mat.—And yet, methinks, it were wrong to stop here! Does not this appetite of the imaging-power after an infinity, which yet it can never attain, seem to point at some strange mystery, which should be enquired into?

Trans.—I think so. And every where is this singular appetite (as you call it) of the imaging-power manifest. To apprehend the figure on the white ground, we settled that it was

* I beg my Kantian readers will pay particular attention to the words "in some points."—T.

† That is, in his theoretical reason. I am aware of what he says respecting the regulative use of the idea of infinity, and also of his "*Praktische Vernunft*"—T.

necessary mentally to draw a line round it.—And what is this line? Does it not as much belong to the white ground as to the figure? does it not mark the contact of them both? There cannot be a boundary of one thing alone; the boundary of the inclosed, is also the boundary of the incloser. The understanding may pronounce the figure to be its object, to the exclusion of the ground, but still the imaging-power cannot stop at the boundary. Nay, I will even communicate to you a curious paradox: the imaging-power has passed the boundary, before the understanding has put it. We have agreed, over and over again, that we cannot take into our minds any figure, without at the same time taking in that which encloses it. Hence the imaging-power, even to take in the figure, must also take in some of the white ground; and it is not till the imaging-power has already taken in some of the white ground, that the understanding can pronounce the figure to be its object. Then if the figure and ground together have to become an object, the imaging-power must take in some of that which incloses the ground, before the understanding pronounces the boundary. Thus is the imaging-power ever going on—on—on, the understanding vainly endeavouring to stop it, but, as it were, itself carried on by the torrent.

Mat.—And now I do perceive something very wonderful. Finity seems to arise merely from the understanding setting bounds, and yet if the understanding try to apprehend infinity, it grasps together a number of finite things, which are its data. If we imagined a person capable of comprehending infinity, we should merely think that he was able infinitely to add up finities, but these finities merely arise from the bounds set by the understanding.—What, then, must have been the mysterious something which preceded the finities?

Trans.—Without saying what the “mysterious something” is, of one thing we may be certain that it is not to be found in the region of the understanding. The understanding is that which sets bounds, its acts do not commence before the setting of bounds, and hence this “mysterious something” which preceded its bounds, does not come under its laws. The logic of the schools exhibits the laws of the understanding; if you are treating of external objects (i. e. things brought to a one by the understanding) you must of course obey the laws of the understanding. But what have these laws to do with that which preceded the bounds? The understanding is merely of use in time. Talk of things eternal, and the understanding is useless. The infinite universe we talked of, was one which should have been embraced by the understanding; but as this required an infinite synthesis, we discovered that it was impossible. We have hitherto, in the preceding dialogues, merely been following the laws of our understanding. And what have we been led to? To contradictions. Finity involved contradiction, so did infinity. The understanding could merely grasp a number of sensible phenomena, but did we direct it to the eternal, aye, or even to the consideration of its own acts, it committed suicide, it ceased to be understanding. We have as yet only shown that there is nothing infinite within the reach of the understanding, but we have not said that there is nothing infinite *without* its reach. I am uttering no mere conjecture, no wild mysticism, but that to which our inquiries have really led us. You yourself observed that for the apprehension of finite objects, a “mysterious something” must precede even the operations of the understanding, and this non-finite something must essentially differ from the infinite created by an infinite synthesis, even were such synthesis possible, which it is not. The understanding has been of this use, its very incapacities have shown us that there is a something beyond its grasp.

Mat.—Then, who knows, but a little child, who has not cultivated the use of its understanding, may be nearer to the contemplation of this something than many a grown man?

Trans.—That is a point which I will not pretend to decide on, but in Mark x, 15, occur these remarkable words; “Whoever shall not receive the kingdom of God as a little child, he shall not enter therein.”

ABSTAINERS.

WHETHER men may ultimately cease to live upon animal food, we cannot positively affirm. But there can be no doubt, that

as far as agricultural experience has hitherto advanced, there seems no probability of a change from the animal to the vegetable. One thing is evident enough to the agriculturist, that the rearing of cattle, and food for cattle, is essentially necessary for preparing the ground for raising food for man. What is called rotation husbandry, is an undeniable proof that Nature will not suffer the animal to be annihilated without punishing man for the crime of extirpation. A succession of white crops, or crops for man, is most ruinous to land; but an alternation of white and green crops,—that is, of corns, grasses, or turnips, &c., preserves the soil in perpetual fertility. What does this prove, but that Nature has resolved that cattle shall share the produce of the soil along with us? This we consider as a settled point. The next point to be determined is—“What is to be done with the cattle?” Why should they be eaten? Is it not horrible to murder inferior creatures merely to preserve the lives of those which call themselves superior, and yet support their existence by living upon dead carcasses? But what is the difference between a dead animal and a dead vegetable? The vegetable must die before you can live upon it. Plan it as you please, still it must be that you live upon DEATH. The vegetable eater lives upon death; the animal eater lives upon death. Sir J. E. Smith, the celebrated botanist, even argues in favour of the vitality of vegetables, their sensitive and conscious existence. That they have a life of some kind is evident. That the destruction of that life is necessary for our existence is also evident. But who can say that more evil is occasioned by eating oysters, than by living upon potatoes? And who can say that more evil is occasioned by killing sheep, than by suffering them to die of the rot in a ditch—eaten up of vermin several days before they finally relinquish life? This frequently happens, even with the utmost care of man to prevent it, and would happen more frequently were man to leave the animal to its own resources.

It seems to us to be a law of Nature, that life proceed out of death. Moreover, it seems to be a law of Nature, that the connection between the vegetable and animal world should be so intimately preserved, that the animal that feeds upon vegetable food should be better calculated for food than that which feeds upon animal diet. In the former case the progression from vegetable to animal is preserved, in the latter it is broken, and a double digestion of the animal nature is the consequence. It is for this reason, we believe, that vegetable eaters are accounted clean food for man; but animal eaters are accounted unclean. This argument may be spiritually used by abstainers in their own behalf, except amongst cannibals.

The experience of all cold countries is in favour of animal food. The Laplanders have little else to live upon, and the Russian empire could not be supported without it. But the inhabitants of the tropical regions do not require it. It is of a heating and stimulating nature. It is especially calculated for cold constitutions, but by no means suitable for warm temperaments.

But what would be done with the animal, were the use of animal food discontinued—and why is milk used by the vegetable eaters? Calve killing alone supplies us with milk; the milk does not belong to man, except through the law of usurpation and extortion.

Two or three years ago, a gentleman, well known to Mr. Owen's followers, though not a disciple of Owen, frequently attended the lectures in Charlotte-street. He was a vegetable eater, and a water drinker. He carried his virtue, however, much farther than the common abstainers do—he would not use cooked food—he ate raw potatoes, cabbage, cucumbers, &c.—and, moreover, he wore his beard in its natural state. He finally took a dislike to leather shoes, and ordered a pair of some vegetable or woolly substance, which had not been procured by an act of deliberate murder. He was a man of respectable connexions, well educated, and of very polished manners. We lost sight of him for two years. About two months ago, in passing through our publisher's shop, we saw our abstemious and eccentric friend sitting on the counter, quite fresh and rosy. We did not recognise him at first, he was so altered in look; but having been sufficiently satisfied, by a little examination, as to his identity, we immediately questioned him as to the change in his appearance. First, he

had a smooth chin, and second, he had rosy cheeks and fresh complexion, and third, he had leather shoes. He told us candidly, that he had partly discontinued his former habits—he now cooked his food. This was evidently the cause of his restoration to health and beauty.* But now he belongs to the Temperance Societies, and is what is generally called a Teetotaler. Now we ask, what other authority, but experience alone, has man got for eating cooked food? We have heard a lecturer on Temperance, i. e. Abstinence, attempt to show the folly of drinking beer, by asserting that the beer was really in the bread, and in a more healthy state. Supposing this to be literally true, which it is not, for beer *acquires* properties by fermentation—upon the same principle we say that the bread is in the grain, why cook the grain at all? and if we cook grain, why not cook grapes, and what is wine but cooked grapes? These doings require justification, and you cannot justify them upon any other principle than that which justifies the killing of animals for food. We allow that it is very disagreeable to our feelings to kill for food; but, as our Commercial Traveller says, "Where are we?" What sort of world are we in, and who made it, and made animals to prey on one another, and fixed it as a law of Nature that it cannot be otherwise; and, moreover, has actually increased the happiness of all animals used for food in a degree proportioned to the evil inflicted? Cattle are never starved, and worked to death, like horses and donkeys; their flesh is not torn by whips, and lacerated by harness; neither are their tails chopped off, like those of dogs and horses, to gratify the perverted taste of a cruel fashion. They live in abundance and ease, and they die an easier death than their envied fellow-brutes of the unclean order. Ask the Society for the Suppression of Cruelty to Animals where the greatest amount of brute misery is experienced, and to what department of zoology their benevolence is directed? They will mention neither oxen, nor sheep, nor fowls, nor fishes, with the exception, perhaps, of eels and lobsters—but they will specify, in particular, dogs, asses, and horses, which, *merely because they are not used by man for food*, are doomed to suffer a larger amount of the evils of the high-pressure system of life than the clean animals. Thus we find that pain and pleasure are pretty equally distributed, even in this respect. Providence has ordained evil in this world, and every species must bear its allotted portion; but, wherever any severe infliction is laid upon one, there seems to be some corresponding benefit conferred, to atone for the suffering.

ROOTS OF PLANTS.—The roots of many plants which, in a state of nature, are small, have been enlarged by cultivation, and rendered capable of yielding a considerable supply of nutritious aliment, for example, the carrot, the turnip, the beet, and the parsnip. Roots that are acrimonious and poisonous when raw, are so altered by the art of cookery, as to become mild, nutritious, and wholesome food, owing to heat destroying the acrimony, upon which their injurious properties depend, and even by simple elutriation (straining) are of the most virulent of poisonous roots, that of *jatropha manihot*, is converted into Tapioca a mild fecula, well known for its nutritive qualities, and universally employed as an article of diet in convalescence, and by persons of delicate habits. By similar means many other roots, also, which are now regarded as hurtful, might be rendered inert, and large additional supplies thus afforded to the vegetable stores already selected for the subsistence of the animal creation.—*Thomson's Botany.*

TO CORRESPONDENTS.

We have carefully read over the remainder of the Commercial Traveller's article, and we must confess that our opinion of it remains unchanged. His object is to lead men to the internal, instead of the external authority for religion. This we ourselves are doing; and, therefore, in so far as this object is concerned, his dialogues are quite superfluous. But, along with this highly important object, he has a minor object in view

—to teach us that weak tea is better than strong—that lemonade is better than brandy and water—and that bread and butter is better than roast beef. This may pass very well in a joke; but when a man seriously engages in a crusade against any species of food, it is more than probable he turns out a tyrant at home, and loses his social good humour abroad. We have known several instances of domestic tyranny by water drinkers, and of more than one instance of abstainers refusing even a mutton chop to their wives in a state of bodily infirmity. Water drinkers we respect, and abstainers we respect, but we prefer leaving them to the light within, as long as their constitution remains uninjured. We have even advised friends of phlegmatic habits of body to drink water in preference to fermented or spirituous liquors, and also to abstain from animal food, for there are some constitutions which will fatten on bread and water; but we would advise all vegetable eaters, and water drinkers, who are sinking in health, to take a little wine for their stomach's sake, and a bit of boiled chicken, or broiled fish, if they can procure it. But every man to his liking. "For neither if we eat are we the better, neither if we eat not are we the worse." It is, however, very remarkable that the interior philosophers should attach so much importance to exterior things. Why should weak tea be better than strong tea for the spirit? and why should lemonade, which is an acid, and very injurious to our stomach, be preferred to brandy and water, which, when used in moderation, is a cordial? Our Traveller says brandy ought to be rejected on that account. Then, why does he not reject warm clothing, a comfortable fire-side, clean linen, and clean bed clothes? or does he act up to his principles in every department of personal and domestic economy? and, if not, where is the line of distinction? We are adorers of cleanliness; we could almost worship a clean person, are we wrong in doing so? are we not gratifying self? We would rather argue the point with the Traveller ourselves, than suffer him to choose his man, and put such yielding opposition into his mouth. We will give him a column of the Shepherd to debate the first principles of his philosophy with us. There is no use in writing to a mind or minds that do not understand. We could quote numerous passages from his manuscript quite incomprehensible. We shall select one or two for him to explain, and we hope he will not explain them as the angels explained the visions of old, but make them sufficiently intelligible to make his writing go into the soul. What is the meaning of "self-acquired knowledge?" We are told to receive nothing from other men, and nothing from ourselves. We suppose we are to receive from God only. Well, give us a specimen of the right and the wrong, and show us how to draw the distinction; and how are we to determine that a preference for weak tea is divine, and a preference for good strong gunpowder, or horequa, with sugar and cream, is selfish and human? and what is the meaning of an "Educator educating education," and "re-signing ourselves up to the divine generator?" This is quite enough for once; and we assure our correspondent we put these questions in perfect simplicity, from a pure conviction that such language is perfectly useless in an educational sense, or in any other sense than a confounding sense.

A Universalist next week. We are sorry to say, however, that his language was not very respectful, but we shall not resent it. Moreover, we paid a sixpence more for his letter—it was double.

A letter lies in the office for the Transcendentalist.

FORMS OF WORSHIP.

"Faults in the life breed errors in the brain,
And these reciprocally those again.
The mind and conduct mutually imprint
And stamp their image in each other's mint."—*Cowper.*

LAST week we conversed of God, and showed that the practical God was not the Father, but the Son, i. e. God manifest in Human Nature, or the United Church. The worship of this Son is the duty which we owe to society; and the forms of worship of this Son are the forms of social intercourse by which we endeavour to render each other happy.

The churches of the old world, in their ignorance, have worshipped the wrong God. They have merely worshipped themselves, or bowed the knees to an image in their own feeble minds. Their worship is a selfish worship, because it is not a reciprocal act. The individual members may all kneel together; the rich may kneel beside the poor; both may listen to the same discourse, and sing the same hymn, but still they are widely separated in interests and affections, and have no confidence in one another, because they do not worship the social God in the spirit of social love, and in the mutual performance of social duty. This social duty constitutes the life and soul of religion. There is no worship without it. All else is idolatry—a dreamy mysticism, a spiritual pride, a state of scattering, in which no individual can enjoy any comfort without alienating himself in idea from his fellow-creatures, and launching, like a solitary wanderer, into the infinite abyss of metaphysical delusion.

Now the only true religious forms of worship are the forms of mutual intercourse instituted for the purpose of creating happiness. Forms of prayer have no such tendency. There is no social duty performed in reading or repeating a prayer. Singing hymns outwardly to an inward spirit is equally distant from the genuine substance of religious worship. God is in man, it is in man alone you can worship him. To man alone can you address yourself, when you address him. To worship him within yourself solely, is merely self worship—to address him seated on a cloud, or elevated in the azure blue, is heathenism—to address him in a stone, or other piece of dead matter, is fetichism—to address him in a statue is idolatry—to address him in the church visible, modelled upon the principle of social and fraternal love, is to worship the Son, who is the image of God, and the Lord of this portion of creation. Unless this Son be worshipped—socially worshipped—the Father's face can never be seen in peace. It hath an eternal frown upon it to an unsocial or divided Church. Can one member of a family be happy, while the rest are miserable? Can one limb rejoice, when the rest are in torture? Can the eye regale itself with the beauties of natural scenery, while the ear is harrowed with the discordant shrieks of oppression, or despair? No; individual happiness is intimately connected with the universal diffusion of enjoyment; and if the selfish soul can shut itself in from the observation of misery without, and contrive to surround itself with the outward signs of enjoyment, in order to escape the melancholy sensations which the

spectacle creates, this only serves to vary the mode of reaction, for the miserable objects of destitution, perceiving the forlorn condition of their being, finally resort to physical rebellion, as the climax of their irritation. This reaction is inevitable; it is merely the agitation of a tortured body, and the attempt to repress it by physical force is like the barbarous sport of Nero, who stuffed his tortured victims' mouths with rags, to deprive them of the melancholy satisfaction of groaning under the operation of the rack. From whence does all this arise, but from a want of worship, and a suitable form of worship, for the social God? What a miserable delusion of selfishness it is which prompts men, under such circumstances, to pray to the metaphysical God within their own bosoms, or in the azure blue, or bend the knee in closets to an old man in the clouds, or to an image of a crucifix, or a Virgin and her Son, or chant hymns, or perform fastings and mock humiliations; and cry and whine, like the priests of Baal, to a God who will not suffer you to approach him except through man? "Get thee up," said the Lord to Joshua, when he lay praying, on his face, with his clothes rent, "Get thee up; wherefore liest thou on thy face? Israel hath sinned." Aye, get ye up! get ye up! wherefore all this praying, and kneeling, and melodious toning of mouth piety? What doth all this avail, when the people have sinned? Who cares for your prayers? Ye have sinned. Repent ye of your ways. "Loose the bands of wickedness, let the oppressed go free, break down every yoke, undo the heavy burdens," and worship God through the medium of a social system—the best form of worship.

O how deplorable it is to see the human mind prostrate in base idolatry before a lifeless form of unmeaning and ineffectual prayer, which for so many generations hath superseded the true worship of God in the heart, through the mediator of social love! To hear a grave divine, reverend in look and dress, and surrounded with reverend and hoary-headed priests of the Son of God, utter such a panegyric upon the mummery of the Church as the one we are about to quote, is almost enough to make one despair of the possibility of ever restoring the human mind to the image of simple nature, which it has lost. It is a piteous specimen of the learning of the schools, and a living comment on the words of Scripture, that the Book is a sealed book to the schoolmen. Dr. Fancourt, in a sermon preached before the clergy of the diocese, in St. Martin's Church, Leicester, 1830, on the insecurity of salvation in the Church of Rome, concludes a wild and most delirious eulogium on the forms of the English Church, with the following serious caution, and apostolical admonition:—"Can there be found men, who having once held intercourse with God, in a liturgy so pure, so spiritual, and comprehensive, close this holy volume of devotion, and seek in a corrupt communion a strange form of worship? To such would we say, 'If your souls have any reliish for what is sublime and pure, if you have any understanding of what is simple and impressive, if you have any delight in seeing, during the hours of prayer, all the attributes of God developed, and all the mysteries of redeeming love displayed, cast not too hastily from you these pearls of prayer, and beware of impoverishing your souls by withdrawing from a Church so purely Apostolic.'" Poor fellow! This sermon

was preached shortly after the passing of the Catholic Emancipation Bill, and during the pressure from without for a Reform in Parliament. The spirit of this *pious* Conservative was grieved, no doubt, at the sinfulness of the nation, which had already begun to exhibit symptoms of discontentment with unheeded selfishness and mercenary baseness, in the distribution of public wealth, and unspeakable imbecility and uselessness in the ceremonious forms of pretended worship. We will not do him the injury even to suppose that the fear of pecuniary loss to the Church had even the smallest influence on his mind. Giving him full credit for sincerity and disinterestedness of purpose, what a melancholy ruin of spiritual being does this short quotation exhibit! *Intercourse with God on a piece of paper!* This is even worse than transubstantiation. And pray what did the piece of paper say? "Lord be merciful to us, miserable sinners." ("Get thee up; wherefore liest thou on thy face? Israel hath sinned.") Why tell God, for three hundred long years, that you and your children are miserable sinners? Is this the way to have intercourse with God? Are these the pearls of prayer which are so valuable for salvation? Can't you get up? Can you do nothing to make yourselves less miserable? Does God do any thing for you in return for these chimes that you perform at church? Why have you forsaken Christ, and gone to the Father without a mediator? Miserable sinners! Miserable sinners you will for ever remain, unless you resolve to worship God with living forms, and address him through his own image, by performing the social duties which you owe to one another. Ye have sinned; your prayers are useless. Your pearls are false; your doom is sealed, unless ye repent—doomed to be and to remain—miserable sinners!

Thousands of volumes have been written, and much good ink, paper and time, consumed, and mental energy squandered, and angry feeling excited, in discussing the trivial controversy of the merits of Church forms, and still the parties continue to expend their *vital* Christianity in the same unholy warfare. Much blood has been shed in settling the debate—grievous calamities have been inflicted upon nations—fields have been desolated, crops have been destroyed, cattle have been houghed, fruit trees burnt, cottages set on fire, and families exposed to cold and hunger, merely because the two contending powers could not, or would not, agree upon the diabolical point of dispute respecting the mode of uttering a metaphysical prayer to a theoretical God. Their very act of collision was an abandonment of the worship of the Prince of Peace, the best and only form of whose worship is peace—the arts of peace—and the social duties which beget and cherish peace. They were contending for a point which the Prince regarded as a mere lifeless form, and for this lifeless form they broke up the living form in which alone his kingdom and his worship consisted.

And what think you, reader, would be the most orthodox objection to this social worship of God in the living forms of reciprocal duty, instead of the dead forms of paper books, amens, and responses? We should be accused of seeking salvation by works instead of faith! The Church has contrived to disseminate widely the notion that works are dead forms, but faith is a living form; and the clergy and people, under the cloak of this mystification, no doubt imagine that there is more vital Christianity in poring over the liturgy, and uttering the responses, than in active co-operation for renewing the forms of social intercourse. Without disputing the truth of the Scriptural axiom, that faith is superior to works, we reply that the one is merely the inward motive, the other the outward manifestation of the motive. They are one and the same, being merely the two poles of the same magnet—their existence is inseparable, and consequently the dispute regarding their separate manifestation is the dispute of ignorance, similar to that of the discussion respecting the separate existence of positive and negative electricity. We call the mind superior to matter, because it rules it; but the re-action of matter possesses a feminine authority over mind, a winning, a coaxing, a moral power, which yet is not a positive, but a negative power. 'Tis so with faith and works. Faith is the inward principle, work is the outward exhibition. The inward is greater than the outward, but the outward is merely the inward made visible. It

matters not, therefore, whether you espouse the cause of faith or works, you are equally in error if you do not espouse both. Now, what sort of faith must it be in the Prince of Peace, which teaches men to establish forms of prayer, written down for all generations, and to pore over these written forms, and kneel upon boards, and utter amens and responses after a clerk, and assume a grave and melancholy air, and go demurely home and dispense with many social comforts on a Sunday, which are not considered evil on Monday morning, and to call this a devout and acceptable form of worship? "Is it not better to deal thy bread to the hungry, and bring the poor that are cast out to thy house? when thou seest the naked to cover him, and hide not thyself from thine own flesh?" Which of the two is the best faith? that which produceth the best fruit.

Now we say the former is not a religion at all. "Religion," in its literal sense, means social union. This is not only the pure and spiritual, but the literal meaning of the word. It means co-operation. Cicero deduces it from "*relego*," instead of "*religio*;" but the difference is immaterial, for "*relego*" means to "gather together," and "*religio*" means to "bind" together. Evidently the word means a "*being together*," and that is social union. Now, the mere spiritualists maintain that this "*being together*," refers to *God and the soul*. This is the selfish aspect of religion, and is allied to that commandment of Christ, "Love the Lord thy God with all thy heart." But there is another aspect, of a social and practical nature, which belongs to the department of works, and which is allied to the new commandment of Christ, "Love one another." This latter is the end and purpose of religion. True religion begets this. False religion cannot beget it. Is, then, your religion true or false? try it by this test.—Is your love of God, or union with God, or relationship to God, true or false, intimate or remote? try it by this test. A perfect religion will bring forth a perfect union between the members of the Church; an imperfect religion will divide the affections of its members. What is the state of your Church? What are the good fruits of your pearls of prayer? What is the meaning of the outcry of the people, the groans of the labourer, the hungry cry of the thousands of helpless children, the untutored ignorance and neglected morals of one-third of our population? Whence did these originate? In religion, or the want of religion? Do not tell us the people won't go to church; church-going is not religion, it is merely a mock union—such a union as takes place daily in Newgate, when the prisoners are collected together. Is the union created within, or is it merely the proximity of bodies—do the members cohere with the living spirit of love, or are they merely the dry bones of a skeleton, connected with wires, and jingling with the discord of unaffianced matter?

Are we blasphemers because we revile your paper-books, your amens and responses, your organs and violins, your clerks and preceptors, your surplices, and your cassocks, and your black gowns, and your velvet and silk trimmings, and your bands, and all the other paraphernalia of what you call your "*Religion*?" Truly, you are a heathen sect; relics of Pagan saints and Ethnic idolators, if your own religion has consecrated dead matter thus. Do not accuse the Catholic of superstition; his dry bones, and the rags of his mummies—his skulls and his fragments of the true cross, are all consecrated by the *same* authority which consecrated your forms of worship. It is a trick of Satan to divert the mind from religion itself, to tempt you to expend the devotion which partly belongs to every man upon things of no living value, that when ye mix with the living images of God ye may say to yourselves, "I have paid my devotions, I have satisfied my conscience, I have done my duty to God, my creator, now I must look after *mine own interest*." Thus it is! The trick succeeds, the deception takes effect, the false worship satisfies the conscience. The Papist is pleased because he has visited the shrine, and crossed himself devoutly at the coffin of a mummy, and touched, with holy look and studious composure, the rag of an old hermit who abstained from woman, or the petticoat of an old maid who escaped from man. The Protestant is pleased because he has beat time with the clerk, bent his knee before a book, and not crossed himself before a crucifix or an image of the Virgin. O Satan! what a wretched art! how gravely thou keepest up the delusions of devo-

tion, and, under pretence of doing service to God, inflict social mischief of the most poignant pain upon the human race!

The best form of worship, then, in our opinion, is that by which the church is formed after the image of a perfect man, whose members are knit together by a living principle of sympathy, which causes each to rejoice in the joy and grieve in the sufferings of its fellow, and self to dispense with all beyond the narrow limits of its own reasonable wants.

ÆSTHETIC LETTERS, ON THE CULTIVATION OF THE HUMAN BEING.

By SCHILLER.

LETTER IV.

So much is certain, that nothing but the preponderance of such a character among a people can render the administration of government, according to moral principles, harmless; and nothing but such a character can insure its duration. In the establishment of a moral government, the law of courtesy is to be estimated as an effective power; and free-will should be attracted into the realm of causes, where every thing, by strict necessity, doth constantly depend upon another. But we know that the determinations of human will always remain uncertain, and that it is only in the absolute being that physical and moral necessity coincide. If, then, the same reliance is to be placed upon the courteous bearing of man, as upon natural consequences, it must be Nature, and he must be led by his impulses to that course of action which is the sole and invariable result of a courteous character. The will of man, however, stands perfectly clear between duty and inclination, and on this sovereign prerogative of his person no physical constraint can be empowered to encroach. If, then, he is to reserve this ability to choose for himself, and yet, nevertheless, be a trustworthy member in the effective combination of powers, this is only to be brought about by making the working of these two springs of action in the realm of appearances completely to coincide, and by the substance of his will remaining the same throughout all the diversity of form, so that his impulses harmonize with his reason sufficiently to be available for a universal legislation.

It may be said that every individual bears within himself the outline and vocation towards becoming a pure ideal human being, and to subsist in harmony throughout all vicissitudes, with the unchangeable unity* of this ideal, is the great problem of his existence. This pure man, who presents himself to our scrutiny, more or less distinctly in every subject, is to be represented through the State—the objective, and, as it were, canonical form in which every characteristic variety of the subjects endeavours to be thoroughly united. Now, two different modes may be conceived how the man in time, and the man in idea, may coalesce; and, consequently, as many, how the State may maintain itself in the individual:—either that the pure man suppress the empirical, that the State abolish the individual; or that the individual become state, that the man in time enable himself to the man in idea.

Certainly, if in the moral estimate, only one side of the subject be taken into account, this distinction comes to nothing; for reason is satisfied if her law only holds unconditionally; but in the entire anthropological estimate, in which the matter contained is computed together with the form, and the living sentiment also has a voice, this distinction will come so much the more into notice. Reason, indeed, requires unity, but Nature variety; and both claim to be legislators for man. The law of the first is impressed on him in a consciousness that cannot be bribed; that of the latter in an indestructible feeling. Hence a defective cultivation is always evinced when the moral character can be maintained only by a sacrifice of the natural; and a political constitution is still very incomplete, if it aim to establish unity only by extirpating variety. The government

should honour not only the objective and generic character in the individuals, but also their subjective and specific character; and, whilst it extends the undefinable realm of morals, should not depopulate the kingdom of appearances.

When the artisan lays his hand on the shapeless mass, to mould it to the form he has purposed, he feels no hesitation in using violence; for the nature that he works on deserves no regard for itself: he is not to consider the whole for the sake of a part, but to look at the part for the sake of the whole. When the artist lays his hand on the same mass, he feels as little hesitation in using violence, only he avoids doing so. He does not respect the material on which he works a little more than the mechanic; but he endeavours, by a seemly and dexterous treatment of it, to delude the eye that would preserve the material in its liberty.†

It is altogether different with those artificers who busy themselves in politics, and in education—who make man at once their material and their problem. Here the design is turned back into the material, and only so long as the whole is serviceable to the part, is the part allowed to accommodate itself to the whole. With a sense of regard very different from this, that the artist feigns for his material, must the master of political art approach his own, and must exercise forbearance towards the property and person of every one, not merely subjectively, and for the sake of producing a delusive effect; but objectively also, for the sake of the inward being.

But since the State must be an organization formed by and for itself, it can only be realized so far as the parts are each in unison with the idea of the whole. Since the State serves as a representative of pure and objective manhood in the breast of its citizens, it has to observe the same relations towards them in which they stand to each other, and it can do honour to their subjective manhood only to that degree in which it is elevated to the objective. If the inner man is in unison with himself, he will, amid the loftiest universality, preserve the peculiar and characteristic conduct of himself, and the State will be merely the enouncer of his noble instinct, the more intelligible interpreter of his inward legislation. And, on the contrary, if in the national character, the subjective man set himself in contradictory opposition to the objective, to that degree that nothing but the suppression of the former can achieve victory for the latter, then will the government employ the stern rigour of the laws against the citizens, and to save itself from becoming their victim, it must trample unconcernedly on an individuality so hostile.

But man may be opposed to himself in a twofold manner, either as a savage, when his feelings lord it over his principles; or as a barbarian, when his principles destroy his feelings. The savage scorns art, and acknowledges Nature as his absolute director; the barbarian derides and dishonours Nature, but, more despicable than the savage, too often continues to be the slave of his slave. The cultivated man makes Nature his friend, and honours her freedom, whilst he merely brides her self-will.

If, therefore, reason bring her moral unity into physical society, she need not injure the variety of Nature. If Nature strive to maintain her variety in the moral structure of society, the moral unity need not be infringed thereby; the conquering power rests equally remote from uniformity in either event. *Totality* of character must be found in a people fit and worthy to exchange the government of necessity for that of freedom.

† It is certain that in a beautiful statue a part of our affection is transferred to the marble; and this implies that the marble then appears to us of a character superior to its real nature, having claims, rights; having power within the limits of its own existence, by a law which lies in itself, which may be the idea of liberty.

THE POPEY OF OXFORD AND THE NEW CHURCH PARTY.

Our readers have often heard of the "*Tracts for the Times*," published by members of the University of Oxford, and professing to reform the church upon Catholic (not Roman) principles. They consist of three octavo volumes, which we have

* I here refer to a work written by my friend Tichte, entitled "Lectures on the Destination of Learned Men," in which this subject, not hitherto attempted in the same way, is luminously treated.

dipped into, but they are exceedingly dull and quite vexatious with childish discussions upon the mere externalities of religion. These tracts which are written or patronized by a Professor of Hebrew, Dr. Pusey, and several clerical gentlemen of talent and influence, are accused of having a tendency to Popery, and for some time past the Conservative party have been waiting and longing for a champion to appear, and take up the gauntlet of the Whig-Popish regenerators. Mr. Peter Maurice, late of Jesus College, Chaplain of New and All-souls Colleges, and officiating minister at Kennington, Berks, has at last spontaneously appeared. His friends and foes, however, seem to have already decidedly pronounced that he is not the man. "I believe" says Maurice, "the learning and intellect of Oxford would never have set me up as the man. I have waited to see if they would bring forward the man, for I know that many in Oxford are quaking under the fearful signs of the present times. But, inasmuch as they set not up *'their man,'* and take no steps to prevent me, I take it for granted, that *I am* at last *the man* whom the Lord, and not men, hath chosen."

Having made his calling and election sure, like a good Christian, Maurice then, boldly and successfully, begins to expose the Popery of the New Church party.

There is something rather anomalous in the circumstance, of a movement towards High Church principle taking place in concurrence with a popular movement. But so it is, and a High Church Party now attempt to revive the almost obsolete notions of the apostolical succession of the clergy, and the absolute spiritual authority of the bishops. But here follows the language of the tracts themselves, which we quote from Mr. Maurice's book, called "the Popery of Oxford confronted, &c."

"There are some who rest their divine mission on their own unsupported assertion; others who rest it on their popularity; others on their success; and others who rest it on their temporal distinction. This last case has, perhaps, been too much our own. I fear we have neglected the real ground on which our authority is built, our *Apostolical descent*."

"We have been born, not of blood, nor of the will of the flesh, nor of the will of man, but of God. The Lord Jesus Christ gave his spirit to his apostles; they in turn laid their hands on those that should succeed them, and these again on others; and so the sacred gift has been handed down to our present bishops, who have appointed us their assistants, and, in some sense, representatives."

"Now every one of us believes this."

"Why, then, should any man, here in Britain, fear or hesitate boldly to assert the authority of the bishops and pastors of the Church, on grounds *strictly* evangelical and scriptural, as bringing men nearest to Christ our Saviour, and conforming them *exactly* to his mind, indicated, both by his own conduct, and by the words of his spirit in the apostolical writings? Why should we talk so much of the *Establishment*, and so little of *APOSTOLICAL SUCCESSION*? Why should we not seriously endeavour to impress our people with this plain truth—that by separating themselves from our communion, they separate themselves not only from a *decent, orderly, useful Society*, but from the *only Church in this realm which has a right to be quite sure that she has the Lord's body to give to the people*?"

Surely the Bishop of Norwich does not belong to this party? No; there are three parties in the Church—the *high, low, and middle*. We suspect the Bishop belongs to the low party. The first is the ascension party, the second is the descension party, and the third is the suspension, or swinging-to-and-fro-on-the-earth, party.

The apostolical succession could only come down to the English Church through the Church of Rome. The acknowledgment of the Divine ordination of the Roman Church is an acknowledgment that the Roman Church is *THE CHURCH*. If the ordination of Popery was divine at the time of the Reformation, when the dissent took place, and when Papal corruption was at its climax of iniquity, surely the ordination is still divine, when the Roman clergy have been purified by affliction, and humbled by manifold political disturbances, to seek for peace in the sanctuary of the soul, where their haughty and baronial predecessors disdained to look for it. This doctrine

makes the Church of England only a lopped-off branch of the true Church. It will work on many simple minds, we doubt not, and lead many stray sheep into the fold of the *'Man of Sin!'** without considering that the whole Church visible is corrupt, and that it is the duty of every good Christian to come out instantly, of stock and branch, and every little twig of it, and be not partaker of its sins.

Regeneration by baptism is another of the heresies of Dr. Pusey. "There is no hint," says the Doctor, "that regeneration can be obtained in any way but by baptism; or if totally lost, could be restored." "Baptism is not a mere initiatory rite, but an appointed means of conveying the Holy Spirit." This is mere Materialism, which is the necessary consequence of following the letter. But it is singular enough, that all these High Church doctrines must become almost literally true when the Catholic Church is united upon social principles, for then every member of the Church visible will have an active portion of the Spirit of Christ, which belongs to the whole body.

Salvation by good works is another heresy quoted from Dr. Newman, the leader of the party. "Our actions will avail for our salvation chiefly as they tend to evidence or produce this frame of mind." Observe here, however, that the frame of mind is the principal; the actions are merely regarded as subordinate. "These holy works will be the means of making our hearts holy, and of preparing us for the presence of God. Outward acts done on principle create inward habits." This is Popish heresy! what a hair-splitting species of philosophy school divinity is! "Good works are of service to us as impressing our hearts with a heavenly character." More heresy! exceedingly Popish! but nothing equal to Nehemiah the Jew, who had the presumption even to entreat God to remember him in mercy for his good works; and far less Popish than Jesus Christ, who said, "they that have *done good*, to the resurrection of life, and they that have *done evil*, to the resurrection of condemnation." But a little thing shakes the nerves of the wicked.

But Newman wants to deify the Virgin Mary! This is too bad. The Trinity is more than enough for a Protestant divine to digest. It would be a pity to create a surfeit by adding the Virgin. But perhaps Newman means to bring her in as a desert. "Our Saviour was born without sin. His mother, the blessed Virgin Mary, need have made no offering, as requiring no purification!" Poor man! what strange notions he has got of purity and impurity! But still it is true, she needed to make no offering for purification. What was wrong with the woman? She could not help it. But this is Popery! Mr. Newman also teaches the doctrine of self-denial, and consequently of religious penance! More and more Popish! "Self-denial was the great evidence which the first disciples gave, and which we can give still." "The self-denial which is the test of our faith must be daily." "The word daily, implies that the self-denial, which is pleasing to Christ, must consist of little things." "A rigorous self-denial is a chief duty; nay, it may be considered as the test whether we are Christ's disciples, &c. The early Christians went through self-denials in their very profession of the gospel. *What are our self-denials*, now that the profession of the gospel is not a self-denial?" We wonder how a Christian minister, as Maurice pretends to be, can presume to find fault with this doctrine of Newman's. If this be Popery, would to God that the whole Church were to become Popish for ever. But what does the author mean by self-denial? and what does Maurice mean by it, when he calls the above language "fallacious sophistry?" We know not, but our opinion of self-denial is "the social distribution of the good and evil of life," upon as equitable terms as is practicable, by a system of social organization. The old fashioned meaning, we know, is merely "individual abstinence, mortification, &c." This we disapprove of as monkish. The self-denial we mean is one

* So they call the Pope; poor fellow! But the Man of Sin is the old man of the heart, the selfish principle in man, which refuses to set up the Church upon the rock of Christ. The Church of England is a member of this Antichrist, and the present contentions which are rending its bowels are merely the warnings of her coming dissolution. She never had much unity—she has now less than ever.

which will make individuals happier in the enjoyment of all innocent pleasure. But hear Mr. Newman. "Rise up then in the morning with the purpose that (please God) the day shall not pass without its self-denial, with a self-denial in innocent pleasures and tastes, if none occurs, to mortify sin. Let your very rising from your bed be a self-denial. Let your meals be self-denials. Determine to yield to others in things indifferent; to go out of your way in small matters to inconvenience yourself (so that no direct duty suffer by it), rather than you should not meet with your daily discipline. This was the *Psalmist's method*, who was, as it were, "punished all day long, and chastened every morning." It was St. Paul's method, who "kept under," or "bruised" his body, and brought it into subjection. "This is one great end of fasting." Really the clergy are going mad for want of something to do. Being too well kept, and having too few self-denials imposed upon them by the country, the consciences of the tender-hearted are reproaching them because they are not suffering for Christ's sake. They, therefore, think of the only agreeable substitute for outward persecution; namely, that of teasing themselves, and going out of their way to inconvenience themselves! Yet these men are not far from the kingdom of God. We like their spirit: they evidently mean well. It is the first step to righteousness. When once a man has brought himself to the state of self-denial in any shape, he is a better man than he whose selfish, grasping, and sensual soul, puts out its lobster's claws, and appropriates every bit of gold or silver, rick of corn, bushel of potatoes, tenth pig, or tenth chicken, that it can catch hold of. It is easier to persuade a self-donnying man to reform the Church, than it is to persuade a grovelling sensualist whose only desire is to be left alone to accumulate whatever filthy lucre the God of this world shall throw in his way. With all its absurdity, therefore, we hail this Popish spirit as it is called. It is a new move, and as we are not afraid of old Popery reviving, for it is dying even abroad, we are inclined to hope that it is the dawn of a new Catholic and universal Christian spirit, which will yet conform the Church of Christ to the pure social love precept of its divine founder. We shall probably revert to this subject on another occasion. We have not yet finished Maurice's book.

CHURCHQUAKE.

About the time of the agitation of the Reform Bill, the whole Church of England began to tremble. The supineness of the clergy was suddenly aroused. The opium-eater arose and rubbed his eyes, and wondered at the noise of the multitude without. To question the purity of the old lady's doctrines, the disinterestedness of her character, or the soundness of her mind, was no less a crime than blasphemy and impiety! A churchman regards the "Alma mater" of England in the same light as a Catholic the Virgin Mary; each is the spouse of God—immaculate; the Church of England may be called Elizabeth or Bess, and the Church of Rome may be called Mary. To suppose that Bess is unfaithful, that she has had an intrigue with the wicked one, that she has ever reared sons and daughters for the enemy of God and man, is a sufficient evidence of your guilt. A celebrated physician in London, among other proofs of insanity alleged against an unfortunate victim of a Commission of Lunacy, added the conclusive and insuperable fact, that the poor man believed in animal magnetism. This was no doubt accounted a capital hit, by those who feared its introduction, or who dreaded innovations, lest they should be obliged to acquire new knowledge, and run the risk of losing old patients. When once a man has established himself in an easy way of living and being respected, he fears any change which makes the continuance of his good fortune doubtful; nay, even his conscience and his self love can enter into compact, and manufacture powerful arguments to prove that changes are dangerous. It is those who suffer, not those who benefit, from the evil, who strive to subvert it; and the best proof of the inward or spiritual corruption of the clergy, is that they are in alarm for the discontinuance of most glaring abominations in outward practices.

A well paying falsehood will be supported even by its enemies a

long while after it is proved to be a lie. We have known private Radicals who wrote publicly for the Tories, just because the Tories paid well. We have known infidels who wrote theology and defended orthodoxy with the accredited weapons of the sanctuary, just because the sanctuary contained a treasury better supplied than that which belongs to the outer court. We have known drunkards who wrote "on temperance and judgment to come" with as much earnestness as Paul himself, when he made Felix tremble; we have known liars reprobate the vice in others of which they were notoriously guilty themselves; and we have seen many fair and unfair dames, flashing forked thunderbolts of scandal around them, whilst they were keenly condemning the same spirit of busy-body-ism in their fellow snakes. Every one has a motive for writing and speaking; some write and speak for money, and some for reputation. If a drunkard write a good article on temperance, he may have a good fuddle over the ready money price of it. If a liar make a good speech in favour of probity, he may open an account on the debit side of his listener's ledger. If a lady expatiate musically and eloquently on the virtues of charity and fellow feeling with the infirmities of our fellow creatures, she may be permitted to finish her oration with a scandalous peroration on the character of her rival, or her next door neighbour. These things are all very natural—very. And what do they all amount to? only this, that the human mind is a gay deceiver, and that its meanings and intentions, its real moral character, are not to be determined by its words, but by its habitual actions. But would the drunkard who writes in a temperance journal, not be sorry if the journal lost its circulation and ceased to pay him for his labour?—very sorry indeed. Would the lady not be sorry if scandal were utterly prohibited?—very. Would the Radical not be sorry if the Tory paper for which he writes and reports were to die?—very. Would the clergyman not be sorry if the Church, by which he acquires money and influence, were to lose its money and its power?—very. 'Tis all very natural.

But is it not too bad to compare a pious servant of Jesus Christ with deceivers, and sinners of the unregenerate world? But where is the pious servant of Jesus Christ? "Let not your hearts be troubled," said Christ, "ye believe in God; believe also in me."—"In this world ye shall have tribulation, but be of good cheer, I have overcome the world." If the world is evil, it is not of Christ, and the pious Christian has nothing to do with it; when it is regenerated or reformed, it becomes Christ, and then the Christian rules and reigns in it. But our pious Christians of the priestly order rule and reign in the evil, and are afraid of the discontinuance of evil, lest their authority should be impaired! When corruption reigned in Church and State, the priesthood were at peace; God was then "a wall of fire around their Zion, and the glory in the midst of her." Now that pluralities are restricted, that boroughmongery, and soul-selling, and church and benefice traffic, are threatened with annihilation, the wall of fire is in danger of being removed, and the glory extinguished! Does the glory of God, then, consist in patronage, selling churches to schoolmen—in pluralities, or heaping aristocratical favours upon offshoots of the nobility, or literary tools of the hierarchy? Does it consist in tithes, that burden and impoverish the land, and rates, that irritate the feelings of the people? in empty pews, that are desolated by cold sermons from pampered and heartless pretenders to the doctrine of the cross? Does it consist of gentlemanly servants of Christ, who associate with the *gentry*, and extract tribute from the *populace*, and do not even preach by example the religion they profess? Oh, yes! it consists of all this, and much more than this, and none but Satan would ever arouse the slumbers of the clergy, by threatening the subversion of a Church so purely apostolic!

One would think, however, that if they had any faith at all, they would have no fear. The Rev. George Davys, Rector of Allhallows, London Wall, and Domestic Chaplain to the Duchess of Kent, in 1830, said, in a discourse on the Churchquake which was then begun, that "a Church is not brought to desolation by the attack of its avowed enemies, but by *its sins against itself*." Why blame the people, then? What have the people to do with the downfall of the Church? The Church has been made a corporation, a close borough. The clergy

alone form the Church (if Church there be, for there is no vocation to express its unity)—the clergy alone are to blame, if there be danger. The Church has sinned against itself, and, like the Roman Babylon and the Mosaic economy, it must come to nought, because it is the relic of a bygone age, and refuses to concur with the progress of successive generations.

Dr. Fancourt, in the same year, had very gloomy forebodings:—"Looking through a perspective, the mental eye may discover gloomy results of ecclesiastical polity, and see, at the end of a period *not very remote*, conscientious Protestants exiles and wanderers for the faith of their fathers, or taunted by *Romanists* with sarcastic railery, saying, 'Sing us one of the songs of your Zion.' If, in the righteous judgments of God, a destiny so bitter be in store for rising generations, who, with honest pertinacity, cling to the principles of the *Reformation*, will may they sit down and weep, when they remember that Church, which has been to them and their country the source of blessings innumerable and inestimable!" The downfall of the Church, it seems, will be regarded by the Doctor as a righteous judgment of God. But for what? not for the long reign of corruption that has preceded the day of *Reform*, but, strange to tell, for the very attempt itself to remove the corruption which has accumulated in the temple! This is priestly reasoning! We always have been told by priests, in other cases, that the judgments of God are slow, but sure. Should the Church, therefore, come down speedily, we have no theological authority to prove that it is a judgment for Whig or Radical Reform, but rather for Tory misrule, and priestly pride, and worldly-mindedness, during three hundred years, in which the Church has been boasting of *Reformation*, and filling the pilgrim's sack of iniquity with the most presumptuous sins.

The insult which was put upon the Bishop of Norwich, a few weeks ago, at his installation, arose entirely from the Conservative spirit, which insists upon the preservation of abuses for ever. "Meddle not with those who are given to change," they have Scripture for it! only it is a Scripture which condemns the *Reformation* as deeply as *Reform*. These men, the Rev. Lord Bayning and others, who opposed the Bishop, would have stuck fast to the Popish Church had they lived in the days of Wickliffe. They are Conservatives; they support Satan in his government of the world, and would be sorry to see a change, unless it were a change which would multiply their subjects, and pour in their tribute with less labour to themselves, and less anxiety about its amount. The Bishop said the Church was not the clergy, but the people. This, no doubt, was offensive. He also said that there might be unity of mind without unity of form; and, consequently, justified Dissenters for objecting to established forms; this also gave offence. He said, moreover, that societies for the promotion of knowledge should not be exclusively in the hands of the Establishment. The liberality of his views called forth shouts of disapprobation, and the Rev. Lord Bayning refused to propose that the sermon should be printed! His Reverend Lordship's conduct was hailed with a concert of approbation from the clergy! What do the clergy mean? They mean, if they could, to monopolize the spiritual power of the country, to dictate to faith, to superintend the seminaries of education, to license or not license teachers and preachers, to multiply churches, to impoverish Dissenters by obtaining government grants to endow their own chapels, and thus lure away the people by cheap sittings, and then clench the nail by an increase of territory corresponding to the increase of their own number.

The judgment which they form of Dissenters, or rather wish to impress upon the public mind, may be estimated from the following quotation, from a sermon by the Rev. Henry Cole, called "British Zion's Watch Tower:—"A man's religious principle is the ruling spring of his life, and if that stand in hypocrisy, his life will be the same, his conversation will not be upright, nor his works in truth! And this is with an abundance of awful testimony proved in our day; for more truth, and integrity, and uprightness, in the intercourse of merchandise, will be found in one plain, unprofessing, naturally honest, *Church-of-England-man* (if we may use the term) *than in ten fleshly gospel-chapel worshippers put together!*"

These fleshly Dissenters (it is a wonder he did not use the

word *bloody*, he was within an ace of it, and most likely would have used it, had it not been a Radical word, but it means the same thing) are a great eye-sore to the Church. Dissenters, Infidels, and Papists, are a Trinitarian Antichrist, which divide the hatred of a Churchman into three equal parts. He stands alone with the sword of the spirit against them all. But, alas! he wanteth courage! he is in fear! the Church is in danger! He cannot sing the song of faith,

Trust in the Lord, for ever trust,

And banish all your fears;

Strength in the Lord Jehovah dwells,
Eternal as his years.

What though the wicked dwell on high,

His arm shall bring them low;

Low as the caverns of the tomb,

Their lofty heads shall bow.

Have they some misgivings that they themselves are the wicked and the *lofty* here meant? The epithet *lofty* can scarcely apply to the poor Radicals and the oppressed labourers of England.

DEVIL WORSHIP IN CEYLON.

THE Ceylonese literally worship the Devil, and their poets sing his praise, as the Author of Evil. He goes by different names, like the Jupiter of the ancients, but still he is the same "Great Black God that causeth the people of the world to be sick." There is the Black Female Devil, and the Great Grave-yard Devil, and the Tusked Devil, and the Death Devil, all hideous personifications of the origin of evil. But still the Ceylonese acknowledge that "the greater one is God." The manner in which the praises of the devils are sung, may be imagined from a few extracts which we will make from a poem, called the Yakkun Nattannawa, which is a sort of liturgy addressed to the different personifications of evil.

"He walks and plays with the four queens of the four banks. He seizes men, and terrifies them with devilish fear, causing them to be sick. We have, accordingly, dressed sweetmeats, and presented them, without any mistake, in the articles. O thou great God, bless and preserve this person! There is no other God besides thee in the midst of the sixteen hundred queens. Thou seizest men, and causeth them to be sick, by placing them in solitude. We have, accordingly, prepared sweetmeats, and offered them to thee, without any mistake. Oh, thou great black God, preserve the sick person by cheering him!

"His whole body is black, and he rides on a bullock. The breast also is black, and a demon is in it. In his left hand is a pool of blood, and white food. May the sickness caused by the black prince be taken away this day.

"Thou livest continually in the streams, and in drains; thou dearly lovest clean and white things.

"The Black Female Devil, who dwells under the rocks and stones of the Black Sea, looks upon this world, and having seen the infants, causes them to be sick. Come thou black devil upon this stage!

"The clothes line in which she (Black Samy) was dressed. The sick person has no (refreshing) sleep by reason of dreams. She dresses with chaplets of flowers. Come thou giddy brained queen!

"The lad called Mangerrie will appear at a distance like a flash of lightning. He has already shown his strength. Come thou furious devil, who art playing and standing in the air, at the height of twenty-eight miles! Come and accept me!

"He plays in the pool of blood; he loves the blood, and the smell of food made by burning. Accept thou the offerings made with fried fish, and take away the sickness which thou hast caused. O, befriend me, thou blood-thirsty devil!

"Thou dwellest in the house, and playest in the laundry. Thou causeth the burning colic, and inflation of bowels. Accept the meat-offerings, and the offerings made with reddish boiled rice, and prepared in the shade of the tree Dombey."

RECIPE FOR MAKING A DEVIL.

"Make a female figure of the *planets* with a monkey's face,

and its body the colour of gold. Offer four offerings in the four corners. In the left corner place some blood, and for victims a fowl and a goat. In the evening place the scene representing the planets in the high ground.

"The face resembles a monkey's face, and the head is the colour of gold. The head is reddish, and the bunch of hair is black, and tied. He holds blood in the left hand, and rides on a bullock. After this manner make the sanguinary figure of the planets.

"Put plenty of blood in the left hand. Make the right hand to lie on the effigies of planets. Make a high foot-stool for it to stand upon, and give the offerings of the ferocious spectre after this manner.

"The fierce and wanton devil will bless every day. He has a golden rope and a goad in his hands; he walks for pleasure, and blows flutes. He deceives the people by looking upon them, and making noises.

"In that day thirty thousand devils obtained permission from the ancient and former king, and much influence for taking pleasure, who were conceived in the womb of the woman Peddooma, and were born in the afternoon of the first Sunday of January."

This is quite enough for a specimen. It is a mad and incoherent rhapsody, but it comes to us only through the medium of a translation, unaccompanied with the traditional knowledge which is necessary to comprehend it. It is evident, however, that the evil principle is worshipped, and entreated by prayer, and offering, and praise, to remove the evil which he has occasioned. The God-Demons are not more horrible than the moral evil which they typify. There is a principle in nature of which they may be the symbol, and it is the object of all religion to enable us to escape that evil. It seems very absurd to us occidentalists to worship the author of mischief; but it is exceedingly natural to supplicate an absolute power, that has the alternatives of pain and pleasure at his disposal, or who can at least confer a certain amount of happiness by removing its opposite. *Nil admirari* (wonder at nothing) is an old proverb, and a good one. Why should we wonder at anything? Nature is a labyrinth, a revolving sphere, in which all extremes meet, and every possible view of a subject is presented. The wise man looks at them all with composure; the fool is always horrified at something.

THE TRANSCENDENTALIST'S DIALOGUES.

No. X.

ON "THE ONE."—(Continued from p. 7.9)

Transcendentalist.—*Materialist.*

Mat.—I own I am scarcely satisfied with the result of our last dialogue. It seems levelled at the overthrow of all that we have been building up for the last nine weeks. We had come to the conclusion that infinity was inaccessible to us, because an infinite synthesis would be required for its apprehension (which synthesis, it would, of course be impossible to complete), and now it seems that a queer sort of infinity is accessible to us, which is, nevertheless, not to be comprehended by the understanding.

Trans.—I do not wonder at your being puzzled at the apparent contradiction into which we have fallen. One of our decisions was, that the word "Universe" with the predicate "infinite," was void of signification.

Mat.—It was.

Trans.—And why? Because we had previously defined "Universe" to be a sum total of sensible objects. It requires an act of the imaging power, and one of the understanding to constitute one object alone, much less a sum total of objects.

Mat.—And yet if we conceive a great mass prior to anything we can cut out, it would seem that the sum total was not apprehended by a synthesis at all, but that we were born with this sum total before us all at once, and then subsequently made our deductions.

Trans.—Not a sum total, nor a total which is apprehended, but one prior to apprehension, or understanding itself. Do you not perceive any way to resolve the contradiction?

Mat.—Indeed I do not.

Trans.—It has arisen altogether from our assuming no higher faculty than the understanding. We first say that the finite arises by the understanding setting limits, and then that the only conceivable way of arriving at the infinite is by a perpetual addition of finites which the understanding grasps, as it were, into one sum. Assuming I say that the understanding is the only faculty, this would be a monstrous absurdity, for whence would come that to which the understanding first sets limits?

Mat.—Exactly. That is the very difficulty I cannot surmount.

Trans.—And let us examine this contradiction. We perceive that it is inevitable, that we do not arrive at it by any false process, but that we must arrive at it. Any finite number of objects is too small for the understanding; an infinite number is too large. Let us turn our glance outward, what presents itself? Stand at the window and gaze straight before you.* Do you observe any limit going round the edge of your prospect?

Mat.—No; my prospect has no edge, it vanishes, as it were, on every side.

Trans.—Observe, I am not talking of the objects which vanish in the distance, but those which, it may be said, border our view.

Mat.—I perfectly understand you.

Trans.—Now suppose you were requested to draw on paper all that is now present to your sight. Could you do it?

Mat.—No, I must draw somewhat less. The edge of my picture would fall within the extent of my vision. Thus paintings are either square, circular, oval, or have some definite form, and as we will assume the painter does not paint more than he sees, we must conclude that he paints less. Since the whole coloured plane which is before me is of no form, any form I would behold must be within the limits of the place.

Trans.—In other words, the whole that is offered to the senses, cannot, at the same time, be an object for the understanding.

Mat.—Nor, indeed, is it an object at all. An object is a determined thing, with certain limits, produced by the imaging-power and the understanding. But this whole, is nothing determined, has no certain limits.

Trans.—But yet it is necessary for the apprehension of an object. We have over and over again said how the superficies that bounds the triangle is necessary to the triangle itself.

Mat.—And very curious thoughts have I had on the subject. In declaring the triangle on paper to be my object, I thereby excluded the surrounding superficies, and directed my attention to the triangle alone. Hence, if I call the triangle my object, I may call the whole extent of the surrounding superficies my non-object. But yet I do not seem to speak quite accurately; though I say, I exclude the surrounding superficies, I cannot exactly exclude it altogether from my consciousness. I am, as it were, obliged to make the non-object an object, which appears to be an absurdity, but is a fact notwithstanding. And still the non-object is not an object in the same sense as the object itself, or it would not be a non-object. I am aware of a distinction, but cannot express in what it consists. I am aware that the non-object is not wholly an object, nor wholly a non-object (although I have called it so), and the point to which I have arrived is exceeding difficult.

Trans.—It is, I grant, exceedingly difficult and intricate; so difficult, that I greatly fear lest my readers (excepting Mr. J. P. G., and a few others, who are conversant with the greatest metaphysical obscurities), may not be able to follow us. That an object is an object, is understood by every intelligent person; but when we come to the point that the non-object is, as it were, an object, and have also asserted that such is the case, we have asserted that which to the understanding is an absurdity; but which is, nevertheless, a fact. "A is A," is the axiom of the understanding, deny that, logic, algebra, &c. &c.,

* This is a curious experiment. Let any of my readers set with heads fixed, and their eyes open, and instead of fixing their attention on every one particular object, endeavour to take in the whole view as an object, they will find it has no form, no set limits and thence, cannot be an object.—T

fall to the ground. "A is not A," is a contradiction to the understanding. The common-sense man, if he finds a system leads to the result "A is not A," throws aside his book in disgust, and declares that the system is false, in the face of it, and he is right so to do. From his own point of view the result "A is not A," is a monstrous, an appalling absurdity. But yet, as I said before, the sentence "A is not A," expresses a fact. I will drop you, my dear Materialist, for a few moments, as I know you are perfectly acquainted with what I am about to say, and address my readers, to whom I am about to render what has been said, if possible, more intelligible.

| | | |
|---|---|---|
| | B | |
| D | A | E |
| | C | |

Let the above figure represent a square surface placed before us, and divided into nine smaller squares. Let us be supposed to direct our attention to the form of the square A, of course A is our object, while the remaining eight squares may be said to constitute the non-object. By making A our object, we exclude the other squares; but yet we find, that to apprehend the form of A, which is a square, we must, as it were, take in the other squares, which form its boundary. Thus we exclude, and do not exclude, the eight squares at the same time. And thus, while we call A our object, and the rest the non-object, we are, at the same time, obliged to admit that the non-object is some sort of an object.

Mat.—I think you have made the case much clearer by the diagram; but it is altogether decidedly difficult.

Trans.—This is, I think, the way to solve the difficulty. A is the object of the understanding, the other squares are not the object of the understanding, but of the imaging-power, which has already passed the bounds out of the understanding. Hence the doubtful position of the "non-object," which seems at the same time an object and no object. The fact is, it has some, but not all, of the attributes of an object. An object is produced by the imaging-power, and bounded by the understanding. Now this non-object (*i. e.* the external squares) is produced by the imaging-power, but not bounded by the understanding. Hence you see it is only partly on its way towards being an object.

Mat.—I see plainly now. The understanding sets limits, but never does it set limits to all that is present to our consciousness, though that does not prove that the unlimited is not present to the consciousness.

Trans.—Exactly. The finite proves the infinite. By showing that we have a finite power, we at the same time show that we have an infinite power. Let us set a finity where we will, we find that we are conscious of something beyond, and hence that the understanding can never alone be an exponent of our whole being. The only use of the understanding is to set bounds to something in our consciousness; and that very faculty of setting bounds implies that there is something beyond those bounds, and of course, in our consciousness, as otherwise, it would not be for us at all. Hence the infinite precedes the finite, is necessary to the very being of the finite, and is at the same time absolutely incomprehensible to the understanding.

TO CORRESPONDENTS.

Universalist.—As far as Mr. Harris individually is concerned, we yield to our correspondent willingly. We meant no personal allusion to Harris; but only to the abstract fact of "money being offered to write against money." H. was not to

blame, and he has acted very honourably in the matter. As for vanity, if we have suspected him of it, it is a very common weakness of human nature; we merely regard it as the sin of weakness, not of hardened wickedness; and pray, who is without it? We have seen the account of a city in ruins, found in the back woods of America, and also of mummies, and coffins of men, from three to four feet and a half in length, but we believe little or nothing more is known of them than what our correspondent has read. We can only conjecture, therefore, that America was peopled of old by a small race of men like Piets or Laplanders, who were so far advanced in the arts of life as to be able to congregate in large cities. But the barbarians of Central Africa do the same at this day; so that we have, as yet, no authority to conclude that they were a superior race of men. The passage from Sir R. Phillip's, to which U. has not given the reference, is from Sir R.'s "Million of Facts."

In the number for July, of the Evangelical Magazine, we advertised the Shepherd. It appears that the advertisement gave offence, for the Editor, in the succeeding number, makes a formal apology for its insertion. This was very kind on his part, for it was equal to a second advertisement, and atoned for the extravagant charge which he made for the first. We paid Thirteen Shillings for the first, which was Four Shillings more than any other magazine or newspaper demanded. This is another proof of the pecuniary skill of that apostate piety which retends to the name of Christian. We are very glad to know that the Evangelical would have rejected our advertisement on its own merits, and we can refer him to very high Christian authority, for saying that his condemnation is not considered very venial. Frazer's Magazine, of this month, speaking of the Evangelical "renowned for its dulness," and the Eclectic "for its impudence," and the Patriot "for its sourrility," says, "To be abused in any, or all of these, is reckoned equivalent to honour among well-disposed people." We do read the Evangelical at times. But we do so with the same feelings with which we would visit Bethlehem Hospital. It presents a melancholy picture of the fall of man, and the necessity of a Saviour. Does the Evangelical consider his conscience justified in pocketing the Thirteen Shillings, and then white-washing his character by an apology next month? "The wages of sin is death." If he wants to throw off the guilt, let him refund the money, or give it to the poor. Judas, even Judas Iscariot, cast down the price of his guilt at the feet of them that bought him. Is the editor of the Evangelical less conscientious than the betrayer of his master. Verbum sapienti sat. We shall be satisfied if the money be given for some public and benevolent purpose; but, as "the wages of a harlot, and the price of a dog," are rejected by the Lord, it would be advisable not to bestow it upon a religious institution.

At the suggestion of a very intelligent friend, we have removed the offensive word Pantheism from our title. In doing so, however, we protest against the prejudice which exists against the word. We used it in the real Apostolic sense, "all end in all." To Pan, is applied by St. Paul to God himself. We have substituted Universalism, which is equally offensive, and may perhaps be itself removed; but in thus running through a course of offence, we are merely affording an illustration of the littleness and the silliness of human prejudices, and the imperfections of language. Our meaning is always the same, and our conscience without reproach, either in respect to God or man.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 12, Vol. III.]

SATURDAY, SEPTEMBER 16, 1837.

[PRICE 1½d.]

THE MESSENGER OF THE MESSIAH DISTINGUISHED FROM THE MESSIAH.

BEHOLD I will send my messenger, and he will prepare the way before me; and the Lord, whom ye seek, shall suddenly come to his temple, even the messenger of the covenant, in whom ye delight, behold he shall come, saith the Lord of hosts.—*Malachi.*

Then palaces shall rise! the joyful son
Shall finish what his short-lived sire begun.

Pope's Messiah.

Last week we treated of the forms of worship, and identified the worship of the *Son* with the practice of social morality. However heretical we might seem to be, we had still the authority, almost verbatim, of one who is highly esteemed as a metaphysician and divine by the religious world; namely, S. T. Coleridge, who, in his "*Aids to Reflection*," Aphorism 23, asserts that "Morality itself is the service and ceremonial of the Christian religion."

In discussing the subject which forms the title and text of this chapter, we will once more accept of the proffered aid of Coleridge, and employ his theological authority to bring out and illustrate our own particular views. The following exceedingly beautiful and interesting little paragraph occurs in his "*Table Talk*:"—"When I reflect upon the subject of the messenger of the covenant, and observe the distinction taken in the prophets between the teaching and suffering Christ, and the triumphant Messiah, the judge who was to follow,—and how Jesus always seems to speak of the son of man in a future sense, and yet always, at the same time, as identical with himself; I sometimes think that our Lord himself, in his earthly career, was the Messenger, and that the way is *now still preparing* for the great and visible advent of the Messiah of glory. I mention this doubtfully."

And pray, why does Mr. Coleridge mention this doubtfully? Because he doubts if Jesus Christ be the final Messiah. Notwithstanding all his outward professions, he really doubts if Jesus be the very Messiah that was promised to the fathers, and suspects it possible that he might only have been the Messenger sent to prepare the way of the Lord, and make the paths straight before him. In this doubt we think Coleridge was right, the doubt was the better faith of the two, and we only wonder why the doubt was not converted into certainty at once as soon as it was experienced. Nothing can be more certain than this, that the Messiah of Abraham, Isaac, and Jacob, has not yet come; that Christ himself left his disciples upon the understanding, and with the distinct acknowledgment, that the work of the Messiah was not performed, and that another advent was necessary to complete it. Nothing can be more evident than this, that ninety years after the birth of Christ, another Messiah, born of a woman, is foretold by St. John from the Isle of Patmos, in language much more distinct and emphatical than that which predicted his first coming. That the Messiah of the prophets is frequently delineated, not as a double character only, but as two distinct individuals; as "the

two olive branches," and "the two anointed ones that stand before the Lord of the whole earth,"—as the priest and the king; "and I will raise me up a faithful priest that shall do according to that which is in mine heart, and in my mind; and he shall build me a sure house, and he shall walk *before mine anointed for ever*;"[†] and, as Coleridge justly observes, to confirm this idea of the double character of the Messiah, Jesus Christ speaks in a future sense of the son of man, whose coming to judgment was pointed out as the grand object of faith for Christians, as well as for Jews. From all this, and much more that might be said on the subject, we conclude that we not only have no right to believe, but we are bound in faith and honour to deny, that the coming of Jesus of Nazareth is a fulfilment of the promise to Abraham. Christianity is merely a typical dispensation, like that of Moses, and must speedily meet with the same doom, that the pride of the Gentiles may be brought down as low as that of the Jews, over whom they have unfeelingly and ignorantly exulted.

But Coleridge informs us that Christ speaks of the "*son of man*" as identical with himself—we allow it; but before we attach a meaning to his words, let us muse a little on his mystical commission. He told all that he knew to his disciples; all that the father had given him to reveal, that he revealed,[‡] and much of that he did not fully understand; he knew there was another coming, but of the time and manner of that coming he knew nothing.[§] But he led his disciples to believe that they would sit on twelve thrones, judging the twelve tribes of Israel, and to the day of his death they believed it would be so, and even argued and contended with one another respecting the precedence in the new kingdom. When he ascended on the Mount of Olives, he did not remove the mystery, and a mystery it is to this day. His actions, his words, his whole life is a mystery, an uninterpreted mystery, the literal understanding of which deceived his immediate disciples and apostles, and is most likely to deceive us also, if we do not uncliothe it by means of the book in which the whole drama is represented in a language peculiar to itself.

Well, then, the identity of Jesus Christ, and the son of man, is none other than the identity of every Christian with Christ himself. The unity of the whole Christian Church is a peculiar doctrine of the New Testament. "For we, being many, are one bread and one body, for we are all partakers of that one bread."^{||} "By one spirit we are all baptized into one body, whether we be Jews or Gentiles, bond or free, and have been all made to drink into one spirit." "Ye are the body of Christ, and members in particular." This is what is called spiritual language—the spirit of the Church is "unity." That spirit is the Christ. It preserves its identity in every individual; whether, therefore, it come in a thousand, or ten thousand individuals, still it is identically the same spirit, the same Christ. There is no other. Interpreting, therefore, all this language as it ought to be interpreted, we cease to have any thing more to expect from the body of Jesus of Nazareth, which has done its work, and ceased to live amongst us. But

* Zech. iv.

§ Matth. xxiv. 36.

|| 1 Cor. x. 17.

—1 Cor. xii. 12–27.

that omnipresent spirit which animated his body, and spake with his mouth, and gave him power to become the founder of a great ecclesiastical polity, will come again *in like manner*, in another individual, and gather more closely together in the unity of the spirit the Church which Jesus Christ has only typically gathered by a physical union of creeds and outward ceremonials.

It is only by this simple view of the subject that the jarring discord of the Christian Church can be reconciled, and all the apparent confusion removed which commentators have long been puzzled withal, and which superficial infidels have cast up with exultation, before the equally superficial believers of the letter of the word. And what a magnificent idea it gives us of the coming dispensation, when we consider that that in which we now live, and which the priests of to-day, like those of Aaron's household of old, regard as a final and everlasting institution, is only a temporary and ceremonial system prefiguring a better, and tending, by the metaphysical subtleties which it presents, to sharpen the visual faculties of the mind, and train it, by a long and tedious system of discipline, to the perfect understanding of all the mysteries of Nature, in so far as they are necessary to establish a form of social union, in which individual happiness shall be carried to the highest possible degree of enjoyment. Who knows but every living soul which has inhabited the earth, and lent his aid to carry forward the work of universal discipline, may rise again in the fulness of time to a conscious enjoyment, even on this terrestrial scene, of the ultimate blessings which are kept in store for the final dispensation which is to wind up the plan of the Providence of God? We know not; but we doubt not that all will be satisfactorily explained at last, and every thinking mind, every longing soul, which burns with holy curiosity to know the destiny of his species, will yet rejoice in the full revelation of the secrets which at present defy his deepest investigation. Of these things we cannot speak with certainty, but it is pleasing for hope, it is delightful for faith, to repose with confidence on the eternal Providence, and even to assert with full assurance that satisfaction *must* be given at last, and the justice of God be vindicated before all his intelligent creatures.

And how is this justice to be vindicated? Only by a fulfilment of the promise to the fathers of a universal monarchy—in which the members shall be knit together in social and fraternal affection—and knowledge, that is, pure moral knowledge, will cover the earth, as the waters cover the sea. This is the work of the Messiah. This work has not yet been accomplished—it is not accomplished among any one people, much less amongst all nations. Even supposing our pious missionaries to succeed in diffusing *their* knowledge of the *truth* throughout the earth, what would be the consequence? Only such another scene of Christian love as this land of light, and valley of vision, exhibits at this present time, when one half of the population is estranged from the Church, and the other half is divided into contending sects, who hate one another with a godly hatred, and make the welkin ring with their mutual recriminations. Would you call this a Millennium? If the empire of China, and the neighbouring islands of Japan and Corea, and all the wilderness of Tartary, and the plains of Hindostan; if all the wilds of Central Africa, the borders of Euphrates and Tigris, and the shores of the Levant, and every little nook and corner of dry earth, were peopled by such Christians as our Churchmen and Dissenters, where, in the name of truth and righteousness, would be your cause for rejoicing? Is there not something more a-wanting than what has yet been manifested by any body of Christians? Is it not all a mockery from beginning to end—a mere type, a mere shadow, with no more reality of social love, than Moses and his goats of atonement for sin? And will you make it any better by saying that the kingdom of Christ is *within*, that the Church is *invisible*, and that, as Dr. Pye Smith, the Dissenter, declares, a political representative in Parliament does not require to be a religious man? What a mockery religion must be, if a lawgiver does not require it! What a useless, fruitless piece of lumber faith must be, if, in the administration of public justice, its services are not indispensable? Truly we are astonished at the delirium of *Christians*, as they call them-

selves, and we can only recover from our astonishment by recollecting that these men are not Christians, but merely *professors* of Christianity.

Christianity within is Christianity without; whenever it is inwardly begotten, it is outwardly revealed. We do not believe in an invisible Church which is not visible at the same time. This cant is a miserable threadbare cloak for hypocrisy to cover its nakedness withal. It is like the fulsome chant of spiritual cleanliness and purity of mind, when the face, and hands, and all the external covering of the body, as well as its undiscovered nakedness, are panting after the water-brook—or the soap-suds. No; “ye will know them by their fruits,”* is a legitimate and infallible test for us to judge of all religious pretensions, and by this test we have most confidently decided that the Messiah has not practically come, and that the Christian Dispensation is merely the messenger to prepare the way before it. We do not aver this *doubtfully*, like Coleridge; we have a little more faith—we are sure of it; and we are equally sure, that if the Messiah had come, Coleridge would not have been troubled with any doubts upon the subject. A man who has never seen the Sun may doubt, when the Moon rises, whether he sees the Sun or not; but no sooner does the day-star appear, than his doubts are for ever dispelled. Who can look in the face of the Sun, and doubt? Yet Coleridge looked in the face of Christ, and doubted whether he were the messenger or the prince, whether he were the morning-star, or the Sun of Righteousness himself.†

But it is a comfortable thing for a man who doubts to have his doubts resolved, and resolved they easily are by the bipolar doctrine of Christian philosophy. The bipolar view of Christianity presents it in two distinct aspects—the scattering, and the gathering—Antichrist, and Christ. The former lasts till the Son of Man come. “There must be a falling away first,” before the Christ come. The whole Church must degenerate from its first love, and continue to make progress in its unsocial transgression, till the time appointed, when the Lord shall consume the Man of Sin with the spirit of his mouth, and destroy him by the brightness of his coming. And pray what is this apostasy? in what does it consist? Some simple creatures say it is Popery! some say Mahometanism! It is neither one nor other, but all of them, and you and we, put together; and Protestantism, perhaps, more than any, for it is a more distant departure from the primitive sociality of Christians. The early Christians began to realize their Master's commandment, and the *moral* of the Lord's supper, by a common table, at which rich and poor met together, and mutual distribution was made of the necessities and comforts of life. This could not last, because it was imperfectly arranged, and the gospel had not experienced that metaphysical ordeal through which it was necessary to pass. Still it was the first fruits of Christianity, and when it ceased the gospel ceased along with it, and has never since been exemplified by the immense mass of its professors. This is the apostasy. The new commandment was, “Love one another;” this was the rule; look at our population, our *Christian* ministers and their flock, and you see the exception. There is no room for doubt; the fact is demonstrable by the finger alone, and can only be overlooked by the selfish principle, which has enveloped itself with a mist of false doctrine, and persuaded itself that this social community of Christian fraternal affection is an impracticable scheme, and that Christian love is merely an inward invisible principle, which conceals itself amid the rubbish of commercial craft, and money-making propensities, and rivalries, and jealousies in trade, and other modes of unsocial intercourse; and that none but God can see this love, which is spiritual only, and constitutes what is called by Dissenters the invisible Church, which is independent of politics, and seeks not the legislative regulations of authorities to give it active being! This is the very climax of hypocrisy, the very uttermost ends of apostate Christianity! an unrevealed love! a Christian Church living in inward love, and outward hatred! a love that does not love, nor do the works of love!

* 2 Thess. ii. 3.

† It is said of the Messiah, that he will bring in everlasting righteousness.—Surely we will know it when we see it.

a love that leaves all its opposite passions and feelings to riot in the soul, and control the actions, and sleepily reposes in god-like tranquillity in the spirit within, and neither attempts to assume the reins of self government nor direct the helm of public affairs, for the completion of the only scheme by which Christianity can become undeniably divine! It is a self-delusion! a head of the great hydra of Antichrist, who is merely the selfish principle in man, and whose destruction must be accomplished by Christ, the social principle, in the establishment of a system of social love.

We have no doubt that this social system will come at last. The present is a monster, which grows daily more hideous. We are now living in times which are really more fearful than the warlike days of our ancestors. The miseries we experience in the conflicts of trade and opinion, are infinitely more vexatious than the civil wars and petty strivings of barons and of princes. The deaths that are occasioned by grief and disappointment are more numerous than those for which the sword is responsible. The widows' groans, and the orphans' tears, are more copious than ever; the hungry stomachs of the helpless poor are as joyless and helpless now, in times of peace, as they used to be in the days of civil commotion. Sorrow and anxiety are on every countenance; and what is worse than all, the tricks of trade are corrupting the morals of mankind, and introducing frauds into every department of commercial intercourse, so that social life has already become the very personification of falsehood. And you call this Christianity! you call these people Christians! you call Protestants the Lord's elect, and the Pope the man of sin! and congratulate yourselves that you were not born Papists or Mahometans! Are you not a deluded people? Members of the body of Antichrist; victims of the selfish principle that inspires him, and heaping up wrath for yourselves and your children, because you will not believe in Christ's *true* system, which alone is calculated to remove the evil from the heart, and from society?

HIGH CHURCH TORYISM OF COLERIDGE.

THERE is a species of virtuous satisfaction experienced in witnessing the intellectual darkness of a great luminary of literary and social intellect. (1) It is a restoration of the equilibrium which his super-eminent qualities, in other respects, had destroyed. The reputation of Coleridge for conversational and logical powers is greater, perhaps, than that of any other individual of the last generation, and is rivalled by few in any preceding age. But the greatness of his mind is strangely contrasted with the littleness of his prejudices. Why did he feel such antipathy to Whigs, Radicals, Dissenters, Unitarians, and Papists? Why did he vent so much *virtuous* indignation against these parties, and speak so tenderly and affectionately of the High Church Tory party, whose errors, notwithstanding, he candidly acknowledged? We can scarcely imagine any other reason than this, that he was a High Church Tory himself, and therefore he regarded the Tories as his own kindred, whose faults were venial and pardonable faults; but all other parties, as enemies to his family, whose smallest sins were to be visited by the *lex talionis*, and attributed to moral and intellectual depravity.

Speaking of the Reform Bill, and the conduct of the Whigs thereupon, he calls their conduct pre-eminently wicked in a political sense, because they appealed to a vulgar majority of voices, playing upon the "necessary ignorance" of the people, and thus destroying all freedom of discussion by *competent heads*, in the proper place. "They have appealed directly to the argument of the greater number of voices, no matter whether the utterers were drunk or sober, competent or not competent; and they have done the utmost in their power to raise out the sacred principle in politics of a representation of *interests*, and to introduce the mad and barbarizing scheme of a delegation of individuals." There is a combination of weakness, sophistry, and falsehood, in this sentence, which makes it very remarkable. We have heard of compendious sentences which expressed volumes of truth; but here are volumes of error, prejudice, and party spirit, and a host of intellectual and moral delinquencies, in full conspiracy against an attempted re-

formation of most glaring abuses in Church and State, without a syllable of reproach against those whose whole energies are employed in continuing the Augean stable in its filthy state. Would it not have been much more noble in Coleridge to have acknowledged the good intentions of Reformers, whilst he pointed out their errors, than to rank himself on the side of those who were either so morally blind as not to perceive the evil of the old system, or so morally corrupt as, having seen it, to refuse to amend it? Of Reformers it can only be said that they are deficient *intellectually*; but of the other party it seems to be very evident that their deficiency is of a moral nature, and if so, they are the principal culprits, for the moral only is responsible for crime.

There was more intellectual strength than moral purity in the intellect of Coleridge, and on any important question of movement in political or ecclesiastical affairs, we would fix his opinion at a very low value. The following sentence, which is merely a continuation of the tirade against Reform, will help to justify the estimate we have formed of the *morale* of Coleridge's intellect. Speaking of the absence of gratitude on the part of the Whigs for the benefits which the nation has derived from the constitution of the Revolution, he says:—"With no humility, nor fear, nor reverence, like Ham, the accused, they have beckoned with grinning faces to a vulgar mob, to come and insult over the nakedness of a parent, when it had become them, if one spark of filial patriotism had burnt within their breasts, to have marched, with silent steps and averted faces, to lay their robes upon his destitution!" This sentence, in the mouth of a young student, when he makes his *debut* at a debating society, in favour of Conservative principles, might sound very well, and perhaps might be regarded as an auspicious promise of future talent, but in a philosopher like Coleridge, in a man who says, "I am by the law of my nature a *reasoner*," in a man who says of his own system of philosophy, "if you once master it, or any part of it, you cannot hesitate to acknowledge it as the truth, you cannot be sceptical about it,"—in such a man the sentence alluded to is nothing but bombast, and a grievous departure from his own theory. The literal meaning of the sentence is, that the Whigs, instead of exposing the nakedness of the British Constitution, ought to have concealed its shame from the profane gaze of the populace. In other words, they ought to have prevaricated, equivocated, mystified, and sophisticated with the people, in order to keep up the delusive notion of the perfection of the British Constitution. This is the moral of the sentence, and a pretty moral it is; a moral which destroys Coleridge's own moral character, and casts suspicion upon all that he has written in favour of the High Church doctrines. If Mr. C. would consider it an unpardonable sin to expose the nakedness of his father the State, he must have shrunk still more from the deeper guilt of unveiling the nudity of his mother, the Church. With such holy reverence for the consecrated shame of a drunken father, and an adulterous mother, can we be certain that Mr. C. has spoken out his inward feelings on the subjects of political and ecclesiastical delinquencies? No, indeed; we can have no faith in the man whose reverence for his mother, the Church, was superior to his zeal for the moral regeneration of the children, whom she had corrupted by her abandoned principles.

The accusation which he has uttered against the spirit of Reform is, moreover, in curious contrast with his own professed principle of raising the moral above the intellectual. The appeal to the necessary ignorance of the majority, is a deep political crime in the eyes of Mr. C.; but we think it would have been a much greater crime to have appealed to the necessary selfishness of the minority. Knowledge is not to be depended upon, if employed by selfishness. Knowledge is a hireling, and works for its master. A knowledge which is hired by a minority to make laws, is a curse to a people; for it employs facts and intellectual energies for selfish and unholy purposes. A universal people alone is free from selfishness. We repeat it, "A universal people alone is free from selfishness," and by a necessary law of its nature it must act uprightly in a moral and social character. We allow that a universal people is not equally accomplished in an intellectual respect; but as the

moral is superior to the intellectual, even in Mr. Coleridge's own system, the universal people has a right, a moral right, to determine the moral basis upon which society shall be conducted. We ourselves disapprove of Radical majorities, but they are a necessary evil; we also disapprove of representative or parliamentary legislation, but it is also a necessary evil—but we disapprove still more of Tory minorities and hereditary legislation; and as we see no possibility of getting out of these latter evils without urging the people on to Radical reformations, we prefer giving our support to the cause of progression, than endeavouring, like Coleridge, to stagnate society by Conservative principles. By progressing we may attain to some good; by standing still, never. "The Church is the last relic of our nationality," says Coleridge. "Would to God that the bishops, and the clergy in general, could once fully understand that the Christian Church and the National Church are as little to be confounded as divided!" What is the meaning of this? it means that there is something wrong, something rotten in Denmark—it means that there is some moral or intellectual deficiency in the Church; but not being a descendant of Ham, the Reformer, our worthy logician merely gives a gentle hint to the gentlemen in lawn, that they are not what they ought to be. He talks very differently of the Dissenters—"I sometimes hope that the rabid insolence and undisguised despotism of temper of the Dissenters may at last awaken a jealousy in the laity of the Church of England; but the apathy and inertness are, I fear, too profound—too providential." "The Roman Catholic Emancipation Act, carried in the violent, and, in fact, unprincipled manner it was, was in effect a Surinam toad, and the Reform Bill, the Dissenter's admission to the Universities, and the attack on the Church, are so many toadlets, one after another, detaching themselves from their parent brute." If Coleridge was by a law of his nature a reasoner, we do not regard him as a correct reasoner. At all events, Providence reasons differently, and the Church, in spite of all Mr. C.'s feeble attempts to conserve its corruption, or, which is the same thing, to preserve it from attack, is doomed, in the councils of Heaven, to be divorced like an adulterous wife, or purified by the purgatory of revolutionary fire. Whose fault is it that it wants purification; and if Mr. C. had had his own way, would it have got purification? We suspect not; and, therefore, we conclude by saying, that the necessary ignorance of the people, with moral justice to inspire them, is a much better pilot to a legislative government, than the necessary talent and logic of schoolmen and landed gentry, with self-interest as their idol. Mercy is better than judgment. We mean, like Ham, to expose this Master in Israel still more to our readers; but we will also reveal some of his peculiar excellencies, for he was a noble spirit and with all his faults we love him. The two principles were strongly developed in him, and the discord was great between the moral and the intellectual nature, the latter being too strong for the former; but the good was evidently of a very high order, and we will not fail to give our feeble testimony to its worth.

* The above quotations are all taken from the "Table Talk."

NATIONAL FEMALE EDUCATION.

THE mother is the first teacher of every human being; for, however we may doubt of the mental generation of the father, that of the mother is irresistibly established by the striking effects assignable to distinct causes, frequently produced on the being previous to birth. So that for a considerable time, and that too when physical susceptibility, and probably mental, is the greatest, the maternal influence is actively and potently working.

For many months, at least from the birth, in ordinary cases, for some years, the mother is the principal instrument of the child's development. Her influence, compared to that of the father, or of any other individual, is overwhelming, because it is not, like his, of an intellectual kind only, but extends by the tenderest associations to every function, power, and Nature. Yet because in ignorance our forefathers originated the fashion

of appointing the commencement of school tuition, at the age of six or seven, we indulge ourselves in the vain hope that all we desire is then in our power. Whereas, by that time the business is almost settled; the greater and deeper part of the character is stamped and settled for ever. All we can do after that is but a modification, a hardening or softening, while the great outline remains the same. "*Emollit mores*" was the old college boast, and truly their power for good extends little beyond the manners. How important then to apply with tenfold energy to the work of educating female youth, on whom the only hope of permanent melioration and happiness of the mass, in the next and future generations so largely, almost totally, depends!

In every human being, considered in his outward relations, the will is the supreme or prime mover; the understanding is the secondary mover; the actions are the subordinate or moved.

External circumstances may modify the lower nature; the father may be the developing means to the child's intellect, but the mother appeals directly to the will, and it is upon the quality of the will, and not upon the quantity of intelligence, or power of activity, that the moral character depends.

Thus, then, it appears, that not only in respect to the time being greater that the child is with the mother, compared to the intercourse with the father, but the sort of education also which is generated by the maternal nature, is of far more moral importance, being no less than the course of the sentiments and affections, which in future years regulate and determine the quality of the actions, and the destiny of the adult.

In every station of life mothers are more exempt from worldly competitive struggles than the fathers; and should, therefore, be chosen by reason, if Nature had not pre-appointed them, the means of *developing*, in the calmness and quiet of home, those internal attachments, and inward aspirations, of which even the most costly college life can merely speak.

The mother's power, then, may be compared to the geometrical ratio, of which the father's is only the arithmetical. The mother imprints her education stereotype fashion, which can only be altered by application to the furnace; while the father works with the common moveable types, which another composer can come and disarrange or re-arrange. The mother dyes in grain, that is to say, before the cloth is wove; the father can only paint, and polish, and varnish, when it has come from the loom.

But what is true of the mother in a physical sense, may not be true literally or spiritually. Let us inquire. In response to that inquiry, I think we shall learn and feel that it is more than physically or literally true. We shall arrive at the conviction, that there is even a maternal nature in that portion of mankind which is of the male sex. What I have written, I venture to assert, is true when so applied, and I beg of your doubting readers, if only for the sake of novelty, to give that application one or two trials.

If I should say it would be a good experiment to reverse the usual mode, and hand over the education of females to men teachers, and transfer the boys to female teachers, I should excite the horror of all prudish minds, whether in breeches or petticoats. Though medical men for the bodies, and priests for the souls, have total liberty, one must not propose an effective means of sweeping off the cobwebs of intellect, and the earwigs of sociality. So I must adopt the next best expedient, and advise that the male teachers should discontinue for a season their rigid intellectual tuition, and meet their pupils on the maternal principle. This will require no small effort, but the results will amply repay, if only for their curiosity and rarity. Nay, further, let individuals make the trial upon themselves. Let not men force every proposition or fact to a slavish submission to mere reason. Let the affections be affectionately treated, and the understanding affectionately and rationally treated. Let us, in spite of Locke's authority, make the experiment upon ourselves, and see whether there be not higher functions of the soul than the understanding. Why, the very word declares that it stands under something else.

When occurrences of opposition and vexation happen, let us for once, not increase the disharmony by *rationality* showing that it is unjust we should be so opposed or vexed, or ease our-

selves by venting our spleen on some equally or more innocent individual, but let us seek out in ourselves the maternal nature, which will enable us to put up with these things, and literally to "take up our cross." Let us find the grave of personal injury within. This is what I venture to call the maternal principle, and no one need be long without an opportunity of trying if he have it.

The attentive reader will perhaps perceive by this time at least one of the senses in which the mother is to be the prime instrument in education, and as it is true in every sense it matters not which is first comprehended. C. L.

P. S.—My pen is something like the young man when he first set off on his commercial travels. He went out without his pocket book; then he discovered that his coat was not brushed clean; a third time he had to return for his samples. Under the auspices of the *Shepherd* I may in time learn to express my meaning in writing. I think I had better go back again, and by another effort ascertain what this said education really is, about which I am writing as well as many other folks.

PURGATORY, ITS ANALOGICAL, ALEGORICAL, AND SCIENTIFIC MEANING.

It may be supposed by many ignorant people that the priests invented the doctrine of Purgatory, and then imposed it upon the people without any authority. But this is a gross mistake; and, indeed, all uncharitable suspicions of this nature are misconceptions, and lead the mind to exceedingly false and absurd ideas respecting the origin and progress of opinion. The foundation of the doctrine is in universal nature itself, and in the Scriptures, from which the Popish priests extracted it. Their ignorance of the Bible necessarily led them to a foolish construction, but it was not more foolish than other constructions which both Papists and Protestants have put upon this mysterious book. In one of the Epistles of Peter, that Apostle speaks of Jesus Christ preaching to the spirits in prison, from which it was naturally concluded that there were spirits confined in the bowels of the earth who were within hope of salvation. In the book of Macabees, it is said that it is a holy and a wholesome thing to pray for the dead, that they may be loosed from their sins; and Isaiah speaks of the wicked being shut up in the pit and visited after many days. There are several other passages in the Bible which may be construed into the doctrine of a Purgatory, so that we have no occasion to be astonished at its appearance and prevalence during the dark ages of the "literal word," when almost no other book but the Bible was read, and that only by priests and monks, whose minds were deranged by over-animated zeal and defective science, and keenly engaged in the devisal of means to rescue disembodied spirits from the burning flames.

We always endeavour to find out a physiological reason for every thing, convinced that Nature does nothing in vain; and, more especially, convinced that all the leading doctrines of the religion of the most civilized people in the world are replete with substantial meaning. They are not mere vagaries, as superficial thinkers idly suppose. They are the mysteries of Nature, under which she conceals for a time important truths, which are hereafter to be revealed. They are seldom to be understood in the light in which the Church views them; but they are never destitute of truth, and they may safely defy all the genius and sophistry of schoolmen or infidels utterly to overthrow them. And why should Nature teach mysteries? You may just as well ask why women should go with veils on their faces, and men never. This has been the case in all civilized, and more especially in half civilized countries, and to this day it is so common in the East, that the women walk the public streets completely shrouded from public view, having only a pair of holes as eyelets to peep through. As nations progress in civilization, this custom declines, and the female face becomes exposed as well as the male. What is the meaning of this in the Divine plan? It is almost universal; and in those countries where progress is at a stand, the veiling of the female face continues in all its original secrecy. It is in

the West chiefly that the custom has been abandoned, because in the West only science has flourished, and unveiled the face of Nature by the discoveries of philosophy. Woman is the representative of Nature. In the infancy of mankind she is despised—her physical weakness is insulted—she is put under restraint—a veil is put upon her countenance; because *then* man is ignorant of Nature, and acting in opposition to her benevolent impulses. As science advances woman becomes more free, more frank in the exhibition of her features, till at last she casts off the veil entirely, and is revealed to public view. The moral of all this is, that Nature shrouds herself from human search in the first stages of progress, and gradually develops her beauties to the inquiring and philosophic mind.

The science of Purgatory may be illustrated in a similar manner. Hell and heaven, though not true in the revolting sense in which they are usually taught, are still fundamental truths, as personifications of the bipolar principles of Nature. They are revealed both temporally and spiritually. At present we shall only treat of their *temporal* development. Hell *temporal* is the old world, and heaven *temporal* is the new. Hell is first revealed because it is at the bottom of the scale. The Church appears first in this state as its embryo form. It is a state of apostasy and misery. It must be delivered from this state by a moral purgation,—a furnace which will remove the dross—and bring forth the gold in greater purity. This furnace is the fire of Protestantism. The Catholic Church is "*the Church*" in corruption. For it alone a purgatory is prepared. Protestantism is not *the Church*, it is merely a *protector* against certain abuses in the *Church*. To Protestantism, therefore, there is no Purgatory. It is nothing but an ordeal; it has neither form, nor character, nor moral energy, as a united polity; it is merely an offshoot from the parent stem, a disaffected sheep which has strayed from the fold because of the negligence of the shepherd. This is the rationale of the rejection of Purgatory by the Protestant Church, and of the peculiar stress that was laid upon this article of faith by the Catholics before the Reformation, when the Church was about to be cast into Purgatory, from which it will finally escape, with a new moral, and a rich spiritual, character.

There were many good things in the old Roman Church which we have not now. She was a better persecutor, it is true, but with Doctor Johnson, we "like a good hater." One who hates strongly can also love strongly. Its hatred arose from its zeal, it was no doubt well meant; but to its own followers, its love was women's love. It was kind to the poor, it was peculiarly attached to the people,* and was indebted to that attachment for all its power. It was on account of its peculiar regard for the common people that it acquired that irresistible ascendancy over princes, that made it the wonder of the world. Its principal agents in acquiring and maintaining this ascendancy, were monks and friars, who were intimately related by familiar converse and association with the poorest of the flock, who also willingly contributed to assist them, both temporally and spiritually, bestowing alms on the poor which they had extorted by fair words from the rich. It was only in the latter days of their career, that they became corrupt, and thus required the furnace of Protestantism to purify them.

Another feature of the old Roman Church is to be admired—it had no hereditary honours. Popes, Cardinals, Bishops, all the great officers of the Church, were elected from the people, and most frequently from the lowest ranks, being taken from the monks and friars, who rose by their talents to the highest dignity to which human ambition could aspire. Protestantism entirely abandoned this equitable system; and established the aristocracy of birth, which now looks down with sovereign contempt upon the poor, with which it has no fellow-feeling. We must go back to the principle of the Mother Church, shaking off all her groundless prejudices, her absurdities, and tyrannies; we must abandon the Protestant, or political doctrine of military and hereditary ascendancy, and adopt the mild and generous doctrine of intellectual and moral domination.

* We speak only comparatively, still regarding it as an apostate from the true social spirit.

The Purgatory of the Reformation was not confined to Protestant countries. It extended over the whole Church. It introduced an intellectual age. It exalted the reason above the moral sense, and created a species of republicanism in thought, which has gradually broken up the old spiritual dominion, so that it has almost wholly disappeared. But we have merely escaped from a spiritual into an intellectual tyranny. Both are corruptions. But as the moral is higher than the intellectual, so in the progress of the Church to its predestined manhood, we must return to the moral power as the legitimate ruler of society. Intellect becomes a purgatory to the moral sense, when the latter is misdirected by the false lights of ignorance and imperfect science. But unless science refine the moral sense, and restore it to its authority, it merely acts the part of a revolutionist, and keeps the mind and society in constant agitation, without being able to accomplish any desirable social improvement.

But not only has Nature provided in science a purgatory for the moral sense, but she has also provided a purgatory for science itself. The stages of science are threefold, like that of the Church:—first, the moral, misdirected by ignorance and theory; second, the intellectual, directed by demonstration and experiment; and third, the moral, directed by demonstration and experiment perfecting theory. We are in the second stage at present. The sciences are *now* merely intellectual. They will all come round to their original object, under less fallible pilotage than they enjoyed in ancient times. Astrology was a moral science; it was cast into the purgatory of astronomy, which is an intellectual science. Alchemy was a moral science; it also was cast into the purgatory of chemistry, which is now an intellectual science; and though we do not affirm, that old astrology or alchemy will revive, any more than the Roman Catholic Church, still we affirm that in the progress of science the moral character will recover its authority, and the demonstrations of astronomy and chemistry will hereafter be employed in a moral sense, and their intellectual *facts* made subservient to higher ends than merely filling the heads of the learned with volumes of observations and experiments, or even of adding invention to invention, to please the childish curiosity of half-tutored minds. The alchemist, ignorant as he was, perceived the analogies between the moral, or spiritual, and the material world; he reasoned deeply upon these analogies; his soul was absorbed in the contemplation of the universal harmony; he reasoned from outward to inward, and from inward to outward; and although he erred, he erred only in his premises, for want of scientific knowledge—but our modern chemists are mere matter-of-fact men, and not a single genius amongst them arises to connect the world of mind with that of matter, and show how the discoveries of material, may throw light upon the darkness of mental and moral science. This, we say, has yet to be done, and this is alchemy, purged and reformed. Astrology, also, will rise again with totally new features. The old spiritual character of religion and science will revive, and come out of the furnace of Protestant purgatory, seven times purified.

WATER DRINKERS &c.

TO THE EDITOR OF THE SHEPHERD.

SIR.—I cannot think why you occupy so much of your valuable space in writing against those humbug water drinkers and vegetable eaters, to the exclusion of so much better fun.

Who does not know that oxen, and sheep, and pigs, and the rest were created to be eaten by man, as fleas and bugs, and at last worms, were created to eat him? As my wife says, what else were they sent for? Your *Transcendentalist* shows plainly enough, that there is no sight unless somebody is present to see, so there would be no cattle unless somebody were hungry enough to eat, and this creation would be actually abridged, and God's works cramped by these lean thinkers.

You know, Sir, when broad-cloth was dear, the men wore great coats down to their heels, large enough to hide body and legs, and all; but now it has become cheap, sparrow-tails, and short

cuts are the fashion. So, when land was cheap, men lived on vegetables, now it is dear we must have flesh, because one acre will support a man on bread, and cabbage, and onions, and potatoes, and such like, while it requires four acres to keep him on sheep and oxen.

Besides, if there was no meat eaten, what would become of all those nice butcher boys and slaughtermen who uphold the dignity of the human race, and are the ornament of civil society. What should we do, alas, for tallow candles, if the dripping-pan supplies were stopped? Why, Sir, we might in the summer time, be reduced to the horrid necessity of going to bed by day light, and of rising at most ungentlemanly mechanical hours. Then, again, are the scavengers, who clear away all the extra dirt, the coal-heavers, who bring the extra coals for cooking, and the dust-men, who take them away, all to be cut off from their employment, and perhaps be driven to other occupations depending on your nonsensical arts of reading and writing?

No, no, Mr. *Shepherd*, yours is the doctrine for me: take the Scriptures properly and literally, "be ye filled with the spirit," no tea and coffee, nasty exciting things, let us have cordial brandy. What else was it sent for? why was it permitted to enter man's head to make it, if he is not to drink it afterwards? These objectors don't study the harmony of things. If I like a thing, is not that enough? Who gave the liking, who furnishes the object liked? the what'd'ye call it (the syllogism, is it not, Mr. Editor), is complete, I may properly take it.

Then, as you so capably prove, horses must be kept, else there would be no jolly drivers and ostlers, and stable boys; in fact, these vegetable fellows would root out every thing valuable in society. These abstainers want to cut us up at the root. Radicals, indeed! I think the best thing you could do, would be to hand them over to the government as most dangerous persons, or at all events get them denounced by the Licensed Victuallers in their excellent newspaper. How could they get even as much as bread without horses to plough the land, even allowing that horses eat half the produce? How could a family subsist on a large well cultivated garden? Why, Sir, one man with a spade cannot produce more than enough for about thirty individuals, and if his family amounted to five persons, the labourer would want nearly one-fifth of his earnings. Look at the market gardens in the neighbourhood of London, and see if the workman get that proportion. Why, Sir, for ten shillings a-week, they send produce enough to market to sell by retail for nearly as many pounds, and here are a set of chaps who want us to create a greater demand for hand labour and less demand for cattle. My goodness, how wages would rise. Why, Sir, the people would soon be coming out of the cotton factories, and shirts and stockings would grow dear. Then working in the air they would not drink so much gin, barley would get cheap, if a long concatenation of evils would come to pass and which you do well to nip in the bud.

In short, if man had been intended to live on vegetable diet, or to keep sober, and to be thoughtful and serious, we should find him so; what were constables and magistrates, and prisons, and chapels appointed for? But it is of no use to argue with such oddities, and I merely write to let you know how some of your readers appreciate your labours. Yours *veritas in vino*.

BIBLIBUS.

[As the foregoing letter is humorous and perfectly intelligible, we willingly insert it. But we do not consider that it is of any moral importance, at present, to agitate the question: we stand on the free ground of temperance, not of abstinence. We believe that, *experimentally*, we know what temperance is as well as any man or woman in society. We have lived for several months at a time on vegetable food, refrained from spirits of any material kind for two years, and scarcely tasted ale or beer, or any fermented liquor once a-week during that time; we have even injured our health by abstinence. We have tried every species of food that our circumstances would admit of, except *uncooked*, so that we can judge for ourselves, but we cannot pretend to judge for other men. At present it is not a social question, it may become one. But as Biblibus has not answered all our objections, we will be happy to insert another letter if he has any desire to meet them.—Ed.]

DISSENTERS IN ENGLAND.

The following list of Dissenting Congregations in England and Wales is taken from the *Congregational Magazine* for January, 1836:—

| | |
|---|---------------|
| Roman Catholics..... | 416 |
| Presbyterians..... | 197 |
| Independents..... | 1,840 |
| Baptists..... | 1,201 |
| Calvinist Methodists..... | 427 |
| Wesleyan Methodists..... | 2,818 |
| Other Methodists..... | 666 |
| Quakers..... | 396 |
| Home Missionary, and other Stations.... | 453 |
| Total..... | 8,440 |
| Establishment..... | 11,825 |
| Majority of Episcopalians..... | 3,385 |

"But we should err egregiously," says McCulloch, in his *British Statistics*, "if we imagined that the number of individuals belonging to the Dissenters and the Church were in any thing like this proportion. Generally speaking, the Dissenters, particularly the Methodists, are much more strict and regular in their attendance at divine service than the members of the Established Church. The latter, indeed, include a large class, partly consisting of the upper, and partly of the lower and middle orders, who are but little scrupulous in their observance of the ordinances of religion. Many, too, of the Dissenting congregations are extremely limited, and though some of them are numerous, yet at an average they are small, compared with those belonging to the Church. On the whole, we incline to think that the entire number of Dissenters in England and Wales does not exceed 2,700,000, or at most 3,000,000, of whom from 500,000 to 600,000 may be Catholics."

THE FAIR SEX AT CONSTANTINOPLE.

The following ordinance, relative to the conduct of Turkish women in the streets and in the public promenades, was published on the 18th of July:—"Though his highness our most gracious sovereign, in consequence of his natural clemency and kind feeling towards his people, gives his attention to the tranquillity and satisfaction of his subjects, and to afford to all, especially the inhabitants of this capital, all decent amusements and the diversions which they find in the fine season in the public promenades, it has, however been noticed by his Majesty that women remain too long in most of the promenades, and do not return home till the time of the evening prayer or later; that in most of the promenades they walk about and sit intermingled with the men; and, lastly, that they have in their service Harem Arabadahi (harem coachmen), who presume to dress in a manner not permitted to the Rajas. Now as all those things are no less contrary to the will of his highness than to the sentiments of all Mussulmen, it is necessary that these scandalous abuses should be done away with; that is to say, that henceforth every one is to walk in a decorous manner; that the women are not to walk about in the promenades mingled with the men; that they are to go home from the promenade at the latest at half-past ten o'clock (an hour and a half before sunset); lastly, that they shall have in their service honest people, and no such Arabadhis as dress in a manner unbecoming Rajas.

Further, though his excellency the Seraskier, conformably with the duties of his office, is constantly intent on securing public order, by maintaining the precepts of religion, and preserving the people from injury and misfortune, by preventing all improper actions, which are displeasing to God, yet for some time past the ancient ordinances relative to tradespeople in the necessary intercourse with the women have been neglected, and it is observed that in particular the dealers in cutlery, the woollen-drapers, and apothecaries, employ their sons or their young men, who wear Fez turbans or kalpacks, as shopmen, and

that the latter deal with the women; that most of them have their magazines and apartments in the back part of their shops, and that the women go into them and make purchases; lastly, that the women even presume to enter the coffee-houses in Pera and Ga'ata, and there to eat ices; duly to regulate these matters, and as it was formerly prescribed that the tradespeople with whom the women deal must be especially honest persons, it is necessary that these tradesmen should discharge all the above youths, whether Armenians, Greeks, Catholics, Jews, or of any other nation, and if they want shopmen employ only sober and elderly persons like themselves; that the women shall not go into the inside of the sitting-rooms and shops, but only converse from the outside; that they shall not enter the apothecaries' shops, but deliver the prescriptions on the outside, and so receive their medicines; lastly that no woman be henceforth seen in a coffee-house. His highness has accordingly been graciously pleased to direct the preceding ordinance to be published and strictly observed, and every person so transgressing is to be severely punished."

A ROYAL LEVELLER.

"The boldest institution of Lycurgus was the division of the lands, which he looked upon as absolutely necessary for establishing peace and good order in his Commonwealth. The greater part of the people were so poor that they had not one inch of land of their own, whilst a small number of individuals were possessed of all the lands and wealth of the country. In order, therefore, to banish insolence, envy, fraud, luxury, and other distempers of the state—I mean extreme poverty and excessive wealth—he persuaded the citizens to give up all their lands to the Commonwealth, and to make a new division of them, that they might all live together in a perfect equality and that no pre-eminence or honours should be given but to virtue and to merit alone.

"This scheme extraordinary as it was, was immediately executed. Lycurgus divided the lands of Laconia, into thirty thousand, which he distributed among the inhabitants of the country, and the territories of Sparta into nine thousand parts, which he distributed among an equal number of citizens. It is said that some years after, as Lucurgus was returning from a long journey, and passing through the lands of Laconia, in the time of Harvest, and observing as he went along the perfect equality of the sheaves of reaped corn, he turned towards those that were with him, and said, smiling, 'Does not Laconia look like the possession of several brothers who have just been dividing their inheritance amongst them?'

"After having divided their immovables, he undertook likewise to make the same equitable division of all their moveable goods and chattels, that he might utterly banish from among them all manner of inequality. But perceiving that this would meet with more opposition if he went openly about it, he endeavoured to effect it, by supping the very foundations of avarice. For first he cried down all gold and silver money, and ordered that no other should be current than that of iron; which he made so very heavy, and fixed at so low a rate, that a cart and two oxen were necessary to carry a sum of ten minæ (or £20), and a whole chamber to keep it in.

The next thing he did, was to banish all useless and superfluous arts from Sparta. But if he had not done this, most of them would have sunk of themselves and disappeared with the gold and silver money, because the tradesmen and artificers would have found no vent for their commodities, and this iron money had no currency among any other of the Grecian states, who were so far from esteeming it, that it became the subject of their banter and ridicule."—Rollin.

[This just proves the truth of the old saying, that wherever there is a will there is a way—and it moreover proves, that one man with authority can do more than a thousand clamourers in reforming the abuses of a state. When will Radicalism ever be able to effect this that was done by a Monarch?]

THE POWER OF MUSIC.—It is singular that the deaf and dumb are not excluded from the pleasures arising from music. A proof of this is related of an artist of the name of Arrow-smith, a member of the Royal Academy, who resided some months at Winton, about the year 1816, exercising his profession of a miniature and portrait painter. "He was," says Mr. Chippendale, of Winneck, "quite deaf. He was at a gentleman's glee club, of which I was present at that time, and, as the glees were sung, he would place himself near some article of wooden furniture, or a partition, door, or window shutter, and would fix the extreme end of his finger nails, which he kept rather long, upon the edge of some projecting part of the wood, and there remain until the piece under performance was finished; all the time expressing, by the most significant gestures, the pleasure he felt in the perception of musical sounds. He was not so well pleased with a solo as with a pretty full clash of harmony: and, if the music was not very good, or rather, if it was not correctly performed, he would not show the slightest sensation of pleasure. But the most extraordinary circumstance in this case is, that he was evidently most delighted with those passages in which the composer displayed his science in modulating the different keys. When such passages happened to be executed with precision, he could scarcely repress the emotions of pleasure which he received, within any bounds; for the delight he evinced seemed to border on ecstasy. This was expressed most remarkably at our club, when the glee was sung with which we often conclude; it is by Stevens, and begins with the words, 'Ye spotted snakes,' from Shakspeare's *Midsummer Night's Dream*. In the second stanza, on the words, 'Weaving spiders come not here,' there is some modulation of the kind above alluded to, and here Mr. Arrow-smith would be in raptures, such as would not be exceeded by any one who was in full possession of hearing."—*Guide to Knowledge*.

THE "CHURCH" signifies, sometimes, the bricks and mortar which constitute the building, this is its physical or lowest meaning; the *Church* signifies, sometimes, the ecclesiastical wealth and revenues, this is its political or worldly meaning; the **CHURCH** signifies, sometimes, the believers in the doctrines of the State Theology, this is its interior or intellectual meaning; but the word **CHURCH** never signifies the thing itself in its inmost or divine meaning. The true signification has gone out of use because the reality is not conscious to men. When the nobler powers of man are unemployed, he descends to lower uses—so is it with his words.

TO CORRESPONDENTS.

A. J. K.—n's letter afforded us much gratification. There was no occasion for the modest timidity which he seems to have experienced in committing his thoughts and feelings to paper. He has evidently read the *Shepherd* with interest, and with understanding, and the light which he professes to perceive in its analogical system of theology, meets with such an ardent response in our mind, that we cannot doubt of his sincerity. It will be a difficult thing for him to lose it, now that he has found it. His musical analogy is perfectly correct, and is in strict accordance with our own mode of reasoning. Society ought to be constructed upon the principle of a band of musicians. Each musician has his own instrument, and the sounds emitted by these instruments are all different in tone and depth. Still the various sounds are made to accord by the rules of art, so that a compound sound is produced, which combines the individual harmony of each into the general harmony of all. But the general harmony would be destroyed if each instrument were not in harmony with itself. Every man is a musical or unmusical instrument of the social band, and the man must be in harmony with himself before he can play harmoniously as a social being. This is one fact. But there is another. Man must learn the moral and social music; and a band is better than private lessons for musical instruction. Many musicians, who play well alone, are disconcerted when they first attempt to play in concert. By playing in

concert they learn time better than by private study. The concert music, therefore, corrects the solo music, and a man cannot be a good musician until he has learned to take part in a concert. A. J. will easily perceive in this the two poles again; first the solitary music, and second the social music. Now, we think the two musics must be perfected together; but the solitary is the basis, and a certain proficiency must be made in it before we can with propriety attempt the concert. This exactly corresponds with the progress of man. Religion hitherto has been giving private lessons in morals, making individuals as good as possible; but it has not yet attempted the concert—that is, the social music. There is, therefore, something yet to learn, the private virtue has to be put to the test; men must associate in order to see what more is necessary. They beat time differently—one ten, another twenty, thirty, or forty, beats a minute. By association this discord would be destroyed, and all men would beat time alike, and play in unison. You may delay the social morality as long as you please, still, when it is first attempted, you have to learn it, whatever proficiency you have made in individual morality. As many pictures, which look well in a private parlour, become daubs in an exhibition; so many good private characters would betray great imperfections if acting in concert with a large association. Private and public morals, though one in vital energy, are yet two distinct polar manifestations of the one moral principle.

MY DEAR UNIVERSALIST.—As our points of difference are rather questions between you and me, than interesting to the general readers of the *Shepherd*, I feel that I cannot fill the pages of that work by writing answers. But I'll tell you what I'll do; if you will send up a letter (post-paid) to the *Shepherd* Office, inclosing your address, or, at any rate, some place whither I might send an answer, I will write you a private letter, and pay the postage to Chatham myself. I strongly suspect that our difference is more apparent than real, and that you have construed some expressions of mine to a sense by me never intended. Perhaps you think, that, supposing a bullet were in a glass of water, I should say the water caused the roundness of the bullet, whereas I attribute no particular virtue to any surrounding body above another, but merely say that that which is finite must be bounded by something or other. Nothing but patches of colour, arranged in different forms, is presented to the eye. Were there no distinction of colour, (I include shade as a distinction) sight would be of no possible use. When you lay your white circle on a white piece of paper, the bounding colour of the former arises from the shade created by the pieces of paper not lying quite close; and if the paper be thick, its edge will be quite sufficient to create a boundary. If you hold it up in the middle of the room, it is the contrast with the dark wall at the back which sets it off. You will say that the circle does not touch the wall, and hence the wall cannot be its boundary; but I say distance is not manifested to the eye alone, but is discovered by the understanding. To the eye a vast extended plane is presented, on which are depicted smaller and larger objects; and the boy's kite, which is but a few feet from the ground, is, as far as the eye is concerned, bounded by the sky. Thus the moon, to our eye, appears in the same plane with what we call luminaries, but by an intellectual investigation we find that the difference of size is occasioned by distance, and what we before called "smaller luminaries" are really larger than the moon. Your definition of a circle is not correct, the circumference is not the circle. In *Simson's Euclid*, Book I., Def. 15, you will find that "a circle is a plane figure contained by one line, which is called the circumference." Yours, very truly,

THE TRANSCENDENTALIST.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 13, Vol. III.]

SATURDAY, SEPTEMBER 23, 1837.

[PRICE 1½d.]

FAITH—A SOCIAL PRINCIPLE, TO WHAT EXTENT.

— Let the world be told

She boasts a confidence she does not hold;
That sick she trembles, knowing she must die,
Her hope presumption, and her faith a lie;
That while she dares, and dreams that she believes,
She mocks her Maker, and herself deceives;
That truth itself is in her head as dull
And useless as a candle in a skull;
And all her love of God a groundless claim,
A trick upon the canvas, painted flame.—*Cowper.*

THERE is nothing so much wanted in these modern days as authority. Both in Church and State, the old authority that held these two polities together is decaying, without leaving a substitute in its stead. Men are a'l eagerly searching after authority in some shape or other. Indeed it is almost the sole object of the investigations of science and literature. All public discussion in the press, or by *viva voce* debate, has this sole object in view, the settlement of questions by the application of a standard of undisputed authority. *Facts* are eagerly sought out in the pages of history, in the fields of science, and in the common occurrences of daily life, and these are curiously strung together, like beads on a string, or like eggs on a thread, and applied to the various purposes for which the respective parties collected them. *Facts*, too, stubborn things, as they are called, are exceedingly accommodating. All parties deal in them; the Tory, Whig, and Radical papers are full of them; and all the religious papers, of every denomination, each has its own string of beads, which it counts like a pious Catholic, taking sacred care that no *counter-fact* be admitted on the string, to destroy the harmony of the fair collection, and invalidate the conclusions with which the gatherer set out, and to which he is resolved ultimately to come.

The trouble which one party takes to destroy the credit of another party's facts, is truly ridiculous. Mole-hills are magnified into mountains, and mountains parvified into mole-hills, with as much enthusiasm as if the salvation of the world were suspended on the issue of the contest. But no settlement takes place; each party remains on its own mole-hill, which it regards as a mountain, and looks with indignation or scorn on its corresponding opposite party, which is equally scornful and blind as itself. And all this arises from want of authority. The Catholic maintains, that the authority is in the Church—the Protestant, in the Bible; the Tory, in the Constitution—and the Radical, in the People. When we come to practise these different theories, we find that there is no such thing as a Church to consult—the Bible is as indecisive as if it did not exist, the Constitution cannot be defined, and the People cannot be found.

Each party is still striving to complete its own authority. The Catholics are striving to determine finally whether authority resides with the Pope personally, or the Pope and his privy council, or the Pope and a general council; and how the Pope should be chosen, to make him legitimate and infallible, whether

by the cardinals, or by the clergy partially, or the clergy and laity universally. The Protestants are striving to make their authority equally conclusive, by arguing stoutly upon texts and passages, making new translations, and abusing the old—twisting, torturing, writhing, adding, and mutilating, and clipping the toes of the sacred book, to fit the slipper which their own Crispin has made for it. The Tories and Whigs are similarly engaged in demonstrating what is, and what is not, the constitution. Some say, it is immutable, like the Catholic Church, and should stand till the general conflagration destroy the earth and all the works of man; others say that it is moveable, but only upon the wheels of the Bishops and the Conservative Peers; others say the Commons may drive, but the Lords and Bishops should put a drag upon the vehicle; others, again, ask what it is? and no one can tell what it is, without meeting a flat contradiction from the gentleman opposite. Then again, the Radicals are labouring hard to prove, first, that there is no constitution, and, second, that a triune commission, appointed by the Crown, is unconstitutional; third, that the people are averse to Whigs and Tories, Established Churches, and other grievances; and fourth, that the people have no means of expressing their opinions, and consequently, we cannot well determine what is their opinion, or if they have an opinion. Moreover, it is not yet decided whether the people be male and female, or male only; that it is not female only, is already finally determined, but it is still a matter *sub judice*, (before the bar) whether, in its political capacity, the people should be of one sex or two. God has evidently made it two; but would it not be advisable for man to cut off one half of God's creation from the lordship of society? And if so, why should the constitution permit a Queen to reign, and forbid women to serve in any other capacity than the domestic servants of Majesty, or the private servants of her Majesty's public servants? All these things are very curious; and all arise from the want of this most desirable of all things, *AUTHORITY*;

Pray where can we find this thing, Authority?

Who is wise enough, good enough, or strong enough, to bring it. Wisdom alone cannot bring it, for people cannot appreciate wisdom, unless they be wise; goodness cannot bring this authority, for people cannot imitate it unless they be good; strength cannot bring it, for it is a moral and intellectual agent, and compulsion is vain as an instrument of instruction. It must be a combination of all the three; and where is the man who has it? We know him not, and we suspect we never shall know him. It is not a man who has this authority; it is *MAN*, or the spirit of society, and that, as we have already proved, is *GOD THE SON*. It is to this authority that democracy is blindly advancing, with merely political vision; but it is in its ecclesiastical sense only that we regard democracy as the *moral government* of God—a state of society to which the world must ultimately attain, when God shall be king over all the earth, and there shall be one Lord, and his name one.

Universality is the highest authority to which we can attain. To this, therefore, we ought to aim, both in Church and State. Now this universality implies faith in the people—faith in the public mind; not faith in a mob party—but faith in the public, genuinely expressed, without fear, and without compulsion; not

such a public as the white public of the Southern States of America, which carries by acclamation the appalling resolution that "man is the legitimate property of man," and is *permitted* to do so by the legislative government of "the land of the Free," in whose dominions this theory of property is reduced to practice—not such a public as the base and ignominious electors of Great Britain, who sell their opinions, their consciences, for pieces of yellow dirt, and then murmur at the corruptions which permit them to pollute themselves. These are not the public, and even if they were the public, they are not free. Neither do we call the Clergy the Church, nor the Establishment the Church, but the Church is the moral sense of the universal people, legitimately, genuinely, and freely expressed. To that we bow with the most passive submission, and regard this submission as the very highest social virtue—faith in God, as he reveals himself in man.

However, although this be practical faith in the highest sense of the word, there are inferior orders of faith which we respect in proportion to the universality of their authority. Social testimony is strong or weak in proportion to its Catholicity. History is a department of social testimony. All history, however, is not social. We believe only the social department of history confidently. We will endeavour to explain this difference. We believe in the battle of Hastings—we believe in the reformation of Luther—we believe in the Revolution of 1688. These are social facts that stamped their image on the public mind, and left their memorials behind them universally extended; but the simple fact of King William of Normandy falling when he first landed upon British ground; or of Luther conversing with the devil in his retirement at Wartburg; or of the Prince of Orange being wise, good, or brave personally, is not a social fact, but a statement originating in, and supported by, individual testimony only. It is from the want of this discriminating mode of separating the two species of historical testimony that the public mind is so easily led astray, either to believe too much, or too little, according to the humour it happens to possess, or the party view of a subject which it happens to entertain. It is a very easy matter to point out the great leading facts of social testimony which have impressed their image on society, and thus established their reality by a proof which is equivalent to demonstration, and which it is for ever useless to deny.

When, therefore, we censure at times the apostate spirit of the Church for deifying the literal meaning of Revelation, we do not allude to the historical department of the Bible, which, so far as it consists of social or universal facts, which have the testimony of a nation or a continent for their reality, we unhesitatingly receive. The letter of the word—the faith and reception of which we condemn by the authority of the book itself which condemns it—is the letter of prophecy and revealed doctrine, not of sacred history, which is not a revelation, but merely a social testimony, to be judged by the same rules of criticism that we apply to the history of Luther, or of William of Normandy. We should be very loathe, indeed, to reject the social testimony of a nation candidly recorded, regarding the origin and history of its political and ecclesiastical institutions; or the social history of a Church which has been regularly transcribed and tested by friends and foes of divers opinions during its continuous publication. But insulated facts, domestic events, subordinate occurrences, we treat with the respect which their trifling importance deserves. So much so, that we consider the mere fact of Christianity having arisen in Judea with a man who declared himself a divine messenger, and manifested extraordinary healing powers, which he communicated to his disciples, who, with this power, perambulated the world, and established the Christian faith in every civilized nation, to be sufficient for social faith to rest upon, and we cannot understand the pretensions of a man to liberality and social feeling who rejects the fact; but the particular details of an evangelist are subject to all the imperfections which attach themselves to every report, however trifling or important, and however accurately expressed and recorded. Even a difference of language in the narrators will give a difference of impression in the hearer. How very far from the living truth are all the ideas which country-people entertain of the great arenas of

public strife in London, of parliamentary eloquence, and popular ferment. The mass of the population in the metropolis know nothing at all, never hear of many of those public associations and *important* (!) meetings which the inhabitants of provincial districts read of in party papers with the most absorbing interest, whilst their imagination arrays them in all the pomp and circumstance of revolutionary excitement, and represents the resident population of the metropolis as listening with ears erect, and waiting with panting anxiety for the evolution of the plot. An imperfect language, addressed to an unsocial and unenlightened imagination, produces sad misconceptions, even when the language itself is the product of simplicity and innocence, and when the imagination has conceived and reconceived from the original report, and begotten its own misconceptions upon other imaginations, it is easy to explain how airy castles arise in faith, with all the *poetic* features of truth, richly painted for effect, like the blues and greens of Turner, or the azure distances of Gastineau, which the polished fancy declares to be likenesses of Nature, but the cooler judgment asserts to be the petted offspring of fancy.

Social faith is wisdom and learning. It is only in the more limited exercise of the believing principle that credulity appears. But this social faith is, as yet, confined merely to a fact, it can go no farther than the fact that Jesus Christ and his Apostles instituted the Christian Church. All else is mystery because it is revelation, and the conflicting poles of human opinion, as the Catholic school of Oxford declares, must vibrate between the two aspects of every question of school theology, "till it settles down into a fixed centre of moderation and adjustment." Upon almost everything respecting Christianity, except this fact, the Church is divided into innumerable fragments, and consequently its universal authority destroyed. This fact alone remains as a starting point to commence *de novo*. Moreover, it is universally acknowledged, that the only commandment which Christ gave to the church, was social love. This is a practical starting point, a solid foundation upon which to rebuild society. Moreover it is universally acknowledged that he promised his spirit to the church. But he taught no doctrine. His authority upon doctrine is completely destroyed by ecclesiastical dissension. Divines are endeavouring to reproduce his doctrine by intellectual discussion, but they want authority; they are merely individuals, and even should they collect millions around them, these millions are merely a section of the Church. Doctrine cannot at present be determined by authority. Why? because the church is not united. A united church could settle doctrine; but a church can only be united by social love. Social love, therefore, is the beginning of the new world, and by endeavouring to effect this in society, by whatever means, we are more actively and usefully employed in the service of the church than by giving our bodies to defend the doctrines and quibbles of a sect, or by giving our substance to pecuniary associations for spreading sectarian Christianity.

All, then, we conclude, that social faith can confidently affirm, is the fact of the institution of the Church by Christ and his Apostles; the fact of the only commandment of Christ being "social love," and the fact of the promise of his presence or authority to his visible or united Church. Every other subject is indeterminable by private discussion, and can only be referred to the church universal, when the spirit of sectarian animosity is put down, and when there shall be neither Catholic nor Protestant, Trinitarian nor Unitarian, bond nor free, Jew nor Greek, but when all shall be one in social affection, and intellect shall be subordinate to the tender feelings and the sensitive principle of the soul. We shall then find truth; for friendship and love are the best reasoners. Party spirit cannot be enlightened; it hates the truth; it strings only its own beads, and refuses to string the beads of other men.

It is the social faith only that can be useful to mankind. The other species of faith may be very useful for intellectual exercise; especially if that exercise be performed with generous and indulgent feelings; but to the social faith only can we look with hope for social deliverance. It is our firm conviction that hope is vain without it; with it there is authority of

the highest order, and a principle of equality and justice which points to the very noblest mode of human association.

We have no doubt that men will turn to it at last; and in those days the *Shepherd* will not be forgotten. His voice now lost amid the howlings of political agitation, and mere intellectual theology, his pages now scorned by the *fearful* worshippers of an unlovely personification of paternal deity, or sneered at by the sensualized wanderers of a homeless and a hopeless materialism, will then shed light upon the beclouded spirit of many a repentant victim of the two cheerless extremes, into which society has long been divided, who will be astonished to find that he who was once called a faithless blasphemer by one, and a spiritual dreamer by another, was only, in his public writings, a living image of universal paternity, first by a course of offence, showing a fellow feeling with every one of the human family, and then summing up the whole by a social view of his great master's mind in the re-union of that church which has been scattered according to the threat pronounced, and will yet be gathered according to the promise delivered.

LECTURE ON ANIMAL MAGNETISM,

BY DR. ELLIOTSON,

At the University College Hospital.

DR. ELLIOTSON lectured, about three weeks ago, on some cases, in which animal magnetism, or Mesmerism, had produced what he regarded as remarkable effects. The first case was one of epilepsy, occurring in a girl sixteen years of age, a housemaid of diminutive stature. She had been subject for twelve months before her admission, on the 4th of April, 1837, to attacks of epilepsy, which occurred about once a week, or oftener. At twelve years of age she had a fall, by which she was stunned; this was worthy of remembrance. She was subject, to almost constant headaches in the morning and evening; they also came on a short time previous to the occurrence of a fit, and sometimes shooting pains across the occiput preceded the fit for a few days. She also experienced before the fit came on a sensation of coldness, which ran up the spine, and was attended with numbness, which, when it reached the head, produced the feeling of her being stunned, and then she lost consciousness. The fit was characterised by convulsions, chiefly of the face and trunk; the extremities were in a rigid state, the hands clenched, the face variously contorted, the eyes rolled. This state was not followed by coma, but with a restlessness and sleeplessness, and a severe throbbing pain of the head, which generally continued for three or four hours. She had been cupped on the shoulders last January, and had leeches applied to the temples, and took some aperient medicine. She had a fit last night; the fits usually come on in bed, during the state intermediate between sleeping and waking. Complained on her admission of headache, and sickness after food; tongue clean, appetite bad, bowels regular.

The peculiarity in this case consisted in the fact of the patient, as soon as the convulsions of the epileptic seizure were over, subsiding into a restless, fidgety state, which lasted three or four hours, instead of falling into the state of coma which is usual in this affection. In the treatment of the case, at first, as the pulse was not full, it was thought there was no necessity for blood-letting, and low diet was considered sufficiently active antiphlogistic treatment; and on the 4th of April quader grain doses of nitrate of silver were commenced, and given three times a-day; the dose was increased by a quarter of a grain gradually, until she reached two grain doses three times a-day. On the 9th the report stated that since the last fit, which occurred on the 6th, she had suffered from continual pain in the temples, and indeed, all over the head, and it was found necessary to take blood, which was bled and cupped. She was now subject to similar attacks, and it was found necessary frequently to bleed her; the pulse was hard and full. On the 16th of May she was bled to eight ounces; on the 20th to eight ounces; and on the 23rd ten ounces were taken away. The nitrate of silver was being increased all this time gradually. She took this medicine for six weeks from its first commencement; he (Dr. E.) never gave it during a longer period, for fear of discolouring the skin. On the 27th of May, the fits

being as frequent as before, though the nitrate of silver was given in two grain doses, that medicine was discontinued, and the cuprum ammoniatum in quarter of a grain doses was commenced, and given three times a-day, the dose being increased by a quarter of a grain twice a-week. On the 5th of June she was taking one grain doses of the medicine; this produced sickness, though, as has been stated, she bore two grain doses of the nitrate of silver. As the copper produced this nausea, the dose was diminished to three-quarters of a grain; and as this now, also, produced sickness, on the 10th she took one minim of creosote with each dose of it, and this effectually prevented the nausea, and the copper was again increased to grain doses. On the 16th the report states, that there has been no nausea and no fit. On the 17th, however, the nausea returned, and the creosote was increased to two minim doses, with the effect of checking the sickness, and she bore the copper well. On the 20th the dose was increased to one and a quarter grains. On the 24th there had been no fit, and there was no nausea. Soon after she began the copper, which had not produced any decided effects, another agent was called into action in the cure, and any alteration in the state of the case, he (Dr. E.) considered was to be ascribed to this. Under this treatment, which he should shortly speak of more fully, the fits ceased altogether, and instead of the patient having convulsions as she used to have, she was now seized with fits of somnambulism, or, as it had been proposed to call the state, somno-vigilium, a much more appropriate term, and one which expressed the condition better, the patient being both asleep and awake, and walking not being necessary for its existence, that symptom being present in only one species of the affection. All at once she would become perfectly insensible, but her eyes would remain wide open, but perfectly insensible to the effect of light: pulling her hair produced no impression on her. Her sense of hearing was lost to all ordinary sound. Though her eyes were open, yet she was perfectly blind; when you dashed the fingers suddenly towards her eyes, there was no winking. Her tongue was not tried, but it is probable her sense of taste was gone. She had never, in her own recollection, had the sense of smell. Yet though now totally without external sensation, she was constantly talking, and talked very sensibly, and wittily too; but from the great variety of topics her conversation embraced, it amounted to rambling. She displayed, also, a great spirit of mimicry. This state had been commonly called somnambulism; somno-vigilium, as he (Dr. E.) had said, was a better term, for this patient could neither stand nor walk, but laid in bed, during the attacks. This state would cease as a fit of epilepsy or hysteria ceases. She would become suddenly still, look wild for an instant, rub her eyes, be sensible of every thing around her, and resume her natural character, which was that of a quiet, modest girl. These attacks were remarkable, both from the sudden manner in which they came on, and the equally sudden manner in which they went off. As she could not be awakened by external impressions made on her, Dr. ELLIOTSON determined on trying what would be the effect of producing a strong internal sensation in her, and endeavoured to get her to believe she was likely to fall to the ground. For this purpose she was lifted from the bed, and it was found that she could not stand; she was then supported under the arms, and at first she felt the ground slightly, then afterwards gradually got a proper feeling in her feet, then by degrees she began to step out, and, with assistance, at last walked freely. She suddenly awoke during the walk, ceased to speak, appeared lost for a moment, then moved her head, seemed astonished, and awoke, and walked to bed well. She was shortly after laid on her bed for repose, and no sooner was this done than she fell again into the same state. In a moment she again became senseless, her eyes again, though wide awake, lost their sight entirely, she talked again in the same rambling way, and was again as rude in her mimicry as before. She was again taken up, and walked about, and was instantly restored, and remained in her natural state for a week. At the end of a few days the same kind of attacks again came on. Nothing had made so great an impression on him (Dr. E.) as to see the brain, as instanced in this case, completely senseless, and yet the mind wandering and active, in two or three moments the

patient, losing all external sensation, which was suddenly again restored, again lost, and again restored. Some similar symptoms were observed in a common epileptic fit, such as the person in a moment becoming perfectly senseless, and as suddenly becoming sensible, but the intellect, as in this case, was not active during the state of external insensibility. After a few weeks the character of these attacks completely changed; she still wandered in her talk, displayed the same spirit of mimicry, sang, whistled, danced, was rude, noisy, laughing, or miserable, by turns, but she also retained in these attacks all her external senses; she saw, heard, and walked well, and the power over the voluntary muscles was entire; she was now in a state of what was called ecstatic delirium; the attacks coming on suddenly, and as suddenly ceasing, no symptom of phrenitis being present, the attacks lasting a few hours, and coming and going like attacks of epilepsy. There you might see her in the ward singing, dancing, and mimicking every individual; sometimes swearing, sometimes rather affectionate; then the attack going off as suddenly as it came on; she seemed lost for a moment, then began to smile, look pleased, and at once became herself again.

Now, they (the students) were aware, that when affections of this nature attacked persons while asleep, and they were partially awakened, the state they were then in was called somnambulism; but when the attacks came on while the persons were awake, and they became half asleep, the result was ecstasy. The one term he had employed, that of "sleep waking," applied to both these states. Sleep waking was much more extraordinary in some persons than in others. This patient recollected in one paroxysm what occurred in former ones, but when out of the attacks she forgot all that took place in them. She had a memory of circumstances which happened in the fits during the presence of the fits only; but she also remembered in the fits those things which occurred out of them. The eyes of this patient converged towards the nose, one rather more so than the other; he (Dr. E.) wished to know if she saw double; she appeared to see everybody, but her vision was much disturbed, for she never winked when the fingers were pushed suddenly towards the eyes, and when one finger was held up she said there were two; when two, that there were four; then she often said that people's "eyes were turning round." &c. This double vision was a common occurrence when one eye converged more than another, and arose from the adductor muscle on one side being drawn aside. When a watch was held to her, she could not tell the minute hand from the other, and it all appeared confused to her, though she seemed to the looker-on to have perfect vision. This symptom had been remarked in other similar cases, as well as the effect also of light on the iris, and pushing the fingers against the eyes, which produced no winking. Gall had mentioned a case similar to the present one, occurring in a young man sixteen years old, who had extraordinary attacks from time to time. "He was agitated in bed without consciousness; his movements and gestures showed a great activity of many internal organs; whatever was done to him he did not perceive it. At length he jumped out of bed and walked hastily in the apartment; his eyes were then fixed and open. He (Dr. Gall) placed different obstacles in his way, which he removed with his hand or carefully avoided; then he threw himself suddenly on his bed, was agitated there some time, and at length awoke and sat up, very much astonished at the number of curious persons who were about him." Gall had also mentioned another case, which was told to him by M. Joseph de Roggenbach, of Friburg. "He told me," says Gall, "in the presence of many witnesses, that he had been a somnambulist from his infancy. In this state his tutor had frequently made him read; made him look for places on the map, and he found them more readily than when awake; his eyes were always open and fixed; he did not move them, but turned his whole head; many times they held him, but he felt the restraint, and endeavoured to liberate himself, but did not awake. Sometimes he said he should wake if they led him into the garden, and *this always happened.*" Cases of this kind on record, said Dr. E., were endless; at first we were induced to smile at them, but we must look at the respectable authority from whence they came. A case was also on record

of "a miller, who, dreaming, and with his eyes open, would go into his mill, enter upon his usual daily occupation, and return to bed, by the side of his wife, without remembering in the morning anything he had done in the night." Professor Upham had spoken also of "an American farmer, who rose in his sleep, went to his barn, and threshed out five bushels of rye in the dark, separating the grain from the straw with great exactness." Dr. Blacklock, the blind poet, on one occasion, rose from his bed, to which he had retired at an early hour, came into the room where his family were assembled, conversed with them, and afterwards entertained them with a pleasant song, without any of them suspecting he was asleep, and without his retaining, after he awoke, the least recollection of what he had done; and Dr. Haycock, professor of medicine at Oxford, would deliver a good sermon in his sleep, nor could all the pulling and pinching of his friends prevent him. In another case, the subject who walked in his sleep, used to tell the occurrences as though they had happened in a dream. In *Frazer's Magazine*, some time since, a case of an American lady was recorded, who, during the time she was asleep, would preach long sermons, and amazed her family by her nocturnal eloquence; "and it was customary," says the relater of the case, "at tea parties in New York (in the houses of medical practitioners), to put the lady into bed in a room adjacent to the drawing room, in order that the dilettanti might witness so extraordinary a phenomenon. We have been told by ear-witnesses, that her sermons, though they had the appearance of connected discourses, consisted chiefly of texts from Scripture strung together. Some of these sermons, we believe, have been published." Now, this, said Dr. ELLIOTSON, could take place in ordinary sleep, when the mental faculties were in a state of great activity. The fragment published by Coleridge, under the title of "Khubla Khan," owed its origin to the following incident:—He fell asleep while reading a book, just as he came to the words Khubla Khan; during his sleep he composed a long poem, descriptive of the palace of Khubla Khan; and when he awoke, he endeavoured to recall to memory the poem composed during sleep; he was writing it out, when he was disturbed by a visitor, who completely drove the train of thoughts out of his head; he could not recall it, and thus he was unable to finish the description which he had so wonderfully begun. If this could occur in common sleep, why in diseased sleep might not cases like those recorded above occur? Now, in sleep, we observe, occasionally, increase of some of the mental powers, while there is a decrease of others. For instance, the conception we have of different persons we see in this state is so strong, that though we are not intelligent enough to see the absurdity of considering them present, when they may be either dead or in foreign lands, yet they are so vividly conceived, that we cannot overcome the conception that they are present. So, in sleep, the sensation of shivering, without our really being cold, is very intense, and our sensation of warmth the same. So, in common dreaming, there is a great partial excitement in the brain; and so, in deep sleep, or coma, and in sleep waking, we are partially awake and partially asleep, some faculties being less, some more, than usually excited. Some persons are able to do in sleep what they could not do when awake, and poems have been composed in this state which could not have been composed had the authors been awake. We find numbers of instances of this increase of power in particular faculties during sleep mentioned by writers. Persons in their sleep have often passed over the most dangerous precipices with perfect safety, though they could not have done so had they been awake. In these instances, the facts may depend on the faculty or emotion of fear being asleep, the absence of fear making the passage safer from the person being steadier. In sleep, however, things could be sometimes done which the person could not effect when awake, and in which the absence or presence of fear could have no effect; for example, the following instance of increase of muscular power during sleep might be mentioned:—One Sunday Mr. Dubrie, a musician, at Bath, attempted in vain to open a window that happened to be nailed down in his bed-room. At night he rose in his sleep, and made the attempt successfully, but threw himself out, and broke his leg. Numerous instances of extra-

ordinary muscular movements, effected during sleep, and which could not have been done in a waking state, were on record. Lord Monboddo describes a sleep-walking girl in Scotland, about sixteen years of age, who in her fits, which began with drowsiness ending in "sleep, or what had the appearance of sleep, for her eyes were close shut," would leap upon stools and tables with surprising agility, and run with great violence and much faster than she could do when well, but always with a certain destination to some one place in the neighbourhood, and to which place she often said, when she found the fit coming on her, that she was to go; and after she had gone to the place of her destination, if she did not there awake, she came back in the same direction, though she did not always keep the high road, but frequently went a nearer way, across the fields, and though her road, from this reason, was often very rough, she never fell, notwithstanding the violence with which she ran. But all the while she ran her eyes were quite shut, as her brother attests, who often ran with her to take care of her, and who, though he was much stronger, older, and cleverer than she, was hardly able to keep up with her. Now, it is not the case, that any particular sense is always dormant in this condition; there is great variety both in the faculties which are affected, and in the amount of torpor. Some persons seem to be insensible to light, not perceiving a light when one is near them, however strong, while they hear the slightest possible noise. An Italian nobleman, named Augustin Forari, was subject to sleep-walking, and on one occasion was watched by Signor Vigneul Marville, who gave the following account:—"Signor Augustin, after playing at cards, retired to repose, and his servant said his master would walk that night; he was lying upon his back, and sleeping with open staring eyes, a sure sign, as we were told, that he would walk in his sleep. I felt his hands, and found them extremely cold, and his pulse beat so slowly that his blood appeared not to circulate. We played at backgammon until the spectacle began. It was about midnight, when Signor Augustin drew aside the bed-curtains with violence, and put on his clothes. I went up to him, and held the light under his eyes. He took no notice of it, although his eyes were open and staring. Before he put on his hat he fastened on his sword-belt, which hung on the bed-post; the sword had been removed. He then went in and out of several rooms, approached the fire, warmed himself in an arm chair, and went thence into a closet where was his wardrobe. He sought something in it, put all the things into disorder, and, having set them right again, locked the door and put the key into his pocket. He went to the door of the chamber, opened it, and stepped out on the staircase. When he came below, one of us made a noise by accident; he appeared frightened and hastened his steps. His servant desired us to move softly, and not to speak, or he would become out of his mind; and sometimes he ran as if he was pursued, if the least noise were made by those standing round him. He went into a large court and to the stable, stroked his horse, bridled it, and looked for the saddle to put on it; as he did not find it in the accustomed place, he appeared confused. He then mounted his horse, and galloped to the house door; he found this shut; dismounted, and knocked several times at the door with a stone which he had picked up. After many unsuccessful efforts he remounted, and led his horse to the watering place, which was at the other end of the court, let it drink, tied it to a post, and went quietly to the house. Upon hearing a noise which the servants made in the kitchen, he listened attentively, went to the door, and held his ear to the keyhole. After some time he went to the other side, and into a parlour in which was a billiard-table; he walked round it several times, and acted the motions of a player. He then went to a harpsicord, on which he was accustomed to practice, and played a few irregular airs. After having moved about for two hours, he went to his room, and threw himself on his bed in his clothes, and we found him in them the next morning, for after his attacks he always slept eight or ten hours. The servants declared that they could put an end to the paroxysm only either by tickling his soles, or blowing a trumpet in his ear."

Now, the hands of the person in this case were cold, as was the case in the patient in the hospital now; her pulse was not,

however, affected as in the case of Signor Augustin. Now, this nobleman, besides the disturbance of those parts which were excited, went about as if he saw well, but took no notice of the candle being placed under his eyes. Now, this could only be explained on the supposition that a part was sensible at one moment, and insensible at another, he (Dr. E.) was not satisfied with this; and we could only otherwise say, that there was an extraordinary state of the organs of the senses. Now, in many cases, though the eyes were shut, persons walked about, and without running against objects in the way. The force of habit might explain this in many cases; things we are in the habit of doing daily we do easily, and in sleep the influence of this habit would be exerted. In some instances, however, this was not a sufficient explanation. Perhaps it might explain some of the circumstances in the case of Signor Augustin, but it would not explain the fact of his taking up a stone to knock at the door, or the visits and walkings in strange places which some sleep-walkers took. Now, in some of these cases, there was great excitement of sensibility in regard to light, which, when applied to the eye, caused great pain. But a person could see through a very small aperture; it was astonishing through how small an aperture sight would be carried. The hole made by the prick of a needle in a piece of paper would transmit sight. Perhaps some cases of persons seeing when their eyes appeared shut might be explained in this way, that their eyelids were not quite closed. Yet there were some cases recorded, in which persons had seen through opaque bodies; a case was related by the Archbishop of Bordeaux, of a young ecclesiastic, who, in sleep, would rise, go to his room, take pen, ink, and paper, and compose good sermons—sermons, perhaps, as good as the Archbishop did, particularly if he was old. They knew that Gil Blas said that the Archbishop of Toledo wrote bad sermons in his old age. When this young ecclesiastic had finished a page, he would read it aloud, and correct it. Once he had written *ce divin enfant*; in reading over the passage he substituted *adorable* for *divin*; but observing that *ce* could not stand before *adorable*, he added *le*. The Archbishop held a piece of pasteboard under his chin, to prevent him from seeing the paper on which he was writing; but he wrote on, not at all incommode. The paper on which he was writing was then removed, and another piece substituted; but he instantly perceived the change. He wrote pieces of music in this state, with his eyes closed; the words were under the music, and once were too large, and not placed under the corresponding notes. He soon perceived the error, blotted out the part, and wrote it over again with great exactness. Perhaps, said Dr. ELLIOTSON, you may pay no regard to this and other such cases which are recorded; but let us hear a case related by Dr. Abercrombie. It was that of a poor girl, who looked after cattle at a farmer's, and slept in a room often occupied by an itinerant fiddler of great skill, and addicted to playing refined pieces at night; but his performance was taken notice of by her as only a disagreeable noise. She fell ill, and was removed to the house of a benevolent lady, whose servant she became. Some years after this change, she had fits of sleep-waking, in which, after being two hours in bed, she became restless, and began to mutter, and, after uttering sounds precisely like the tuning of a violin, would make a prelude, and then dash off into elaborate pieces of music, most clearly and accurately, and with the most delicate modulations. She sometimes stopped, made the sound of tuning her instrument, and began exactly where she left off. After a year or two, she imitated an old piano also, which she was accustomed to hear in her present residence; and in another year began to talk, to descant fluently, most acutely, and wittily, and with astonishing mimicry, and copious illustrations and imagery, on political, religious, and other subjects. For several years she was ignorant of all around her in the paroxysms; but at about the age of sixteen she began to observe those who were in her apartment, and could tell their number accurately, though the utmost care was taken to have the room darkened; and when her eye-lids were raised, and a candle was brought near the eye, the pupil seemed insensible to light. Now (Dr. ELLIOTSON said), he was convinced that persons had such an increase of sensibility in the eyes, in some cases, that what appeared

dark to us was light to them, and they saw well. He had now a patient, who constantly sat in the dark; when he went to see her, he was always led into the room where she was, and led to his seat; she saw him plainly, but he could not see her for several minutes, though he gradually obtained vision. So, under morbid states, what is darkness to most persons was light to them. No doubt the statement which had been given to Dr. Abercrombie, respecting the case which he had recorded, was correct.

Some persons, however, went farther than this; they stated that people in sleep-waking, not only have seen when their eyes have been closed and bandaged, but have, also, seen when a piece of pasteboard has been held before the eyes, and seen well, too. It had also been said, that people saw with the surface of their bodies, by placing an object at the pit of the stomach; they would tell its colour, &c., and the same by touching it. They also said that some persons perceived tastes of different kinds by the same mode of trial. They even went farther than this, and said that a letter that had been wrapt up carefully, and placed at the pit of the stomach, had been read. We had cases of this kind showered in upon us from all quarters. From France, Italy, Germany, America, and Ireland. What were we to do? One of these cases from America was not a hundred years old, but occurred in 1834, and was recorded by Dr. Belden, in the *American Journal of the Medical Sciences* for that year. The patient, a girl sixteen years of age, in these paroxysms, saw with her eyes closed and most carefully bandaged, and in the dark. Sometimes she evidently saw, and was directed by her eyes, for when the stair-door, which was usually left open, was fastened by the blade of a knife placed over the latch, she rushed from her room impatiently, and extending her hand before reaching the door, seized the knife, threw it indignantly upon the floor, and exclaimed, "Why do you wish to fasten me in!" Generally the eyes were closed, sometimes they were wide open, and the pupils dilated. She almost invariably supposed it was day, and when advised to retire, usually replied, "What! go to bed in the day time?" When a light, reflected from a concave mirror, was once thrown upon her closed eyelids, she exclaimed, "What! do you wish to shoot me through the eyes?" Once, when she was writing out a song, with a black handkerchief over her eyes, a person placed a piece of brown paper between her eyes and the paper on which she was writing, and she exclaimed, "Don't, don't." She played well at backgammon in the paroxysms, and conquered Dr. Butler, an experienced player. Sometimes she displayed astonishing powers of mimicry, though she never did so during the time she was awake. She recollected from paroxysm to paroxysm what occurred in each, but forgot, when awake, what had happened in them, and would declare that she never played at backgammon, &c.

So far as the cases go, said Dr. ELLIOTSON, the details in all of them are more or less like ours, but they go beyond what I have ever seen. It appears that in this last case light must have got through some small aperture; we can scarcely fancy that it was not so. Two cases are recorded from Boulogne, in which patients saw with their stomachs, and tasted what was put there. Whether to believe these things or not, he (Dr. E.) did not know but he was determined to see for himself before he passed judgment on any of them. He was quite ready to see any case which might be shown to him. Some reporters went farther than this,—they said that one patient, besides seeing with the stomach, saw, also, with the elbow; and that others described the topography of Paris, though they had never been within hundreds of miles of that city. Others, again talked strange languages, though they new nothing about them when awake. There were strange things in sleep-waking, no doubt, but the knowledge of accidental facts such as the topography of a strange city, and the knowledge of a strange language, could not be credited without being witnessed. Now, the question arose, whether these states could be produced by means of art; they were evidently depending on a diseased state, as epilepsy was. The girl now in the hospital was thrown into the remarkable state by the manipulations which had been called animal magnetising. The gentleman who magnetised her would pass one or both hands gently before her; in a few minutes she

would stare, move her eyes, and then go to sleep. This had also occurred in a large number of other instances. Some had said the result was to be attributed to the gentle motion of the hands, as that would sometimes, as was known, send people to sleep; but it could not be in all cases, as the effects were produced when the magnetiser stood some distance off, and sometimes even by one or two movements. The same thing also occurred in some cases when the movements were made behind person's backs. A parrot of his (Dr. E.) had been sent to sleep by a few strokes down the back, in the morning, a time during which it was never used to sleep. Many persons, again, entirely resisted the influence of the magnetising. He had resisted its influence, as also had many gentlemen who had sat to be operated on. Besides the effect being produced in some persons when at a great distance, and in others by one or two movements, the sleep was sometimes most interse. He thought the manipulation had greater influence than had before been imagined. Now, he had read of all these things many years ago, and felt anxious to know something more about them. In 1829 Mr. Chenevix, who had been in Paris, and practised Mesmerism to some extent, was willing to show him the effect of it. He (Dr. E.) took him to *St. Thomas's Hospital* to try its effects on some nervous patients, in whose cases it is said to do most good. He (Dr. E.) was not satisfied with its effects on any but one patient, and in that instance the results were so extraordinary, that he felt convinced that it was a subject not altogether to be laughed at. The patient was an ignorant Irish girl, who had never seen or heard of the gentleman. She was brought into a private room, and the manipulation commenced; in a minute or two she begged he would not go on, as she said it produced great weakness in her, and a pain in the abdomen. This pain went off when a transverse motion was made over the part. He (Dr. E.) did not infer much from this, for he thought this effect might be merely imaginary, but when the manipulator suddenly darted his open hand upon her arm, and she suddenly lost the power of it, which was again as suddenly restored by a few transverse motions; and when he showed the same effects on the other arm, and also on the leg, and produced the same results when the girl's eyes had been closed, he (Dr. E.) began to be staggered. On one occasion, too, while she was in this state, the operator placed a very small piece of paper on one of her feet, and then she could not raise that foot, but after a few transverse motions had been made she raised it easily. This occurred again and again. He was satisfied there was no deception there. He was astonished at the effects, and when asked if he was satisfied, he did not say at first either yes or no; he was almost ashamed to say that he was not. On first seeing a thing of the kind, he thought it excusable for any one to suppose there was collusion, and disbelieve the effects altogether. He had published an account of those experiments in the "*London Medical and Physical Journal*," for 1829. He was fully satisfied that there was something more than imagination in these things, but he had had no opportunity or time to carry on the investigation, till he heard of Baron Dupoiot being in London, who had magnetised for twenty years, and some of whose works on magnetism he (Dr. E.) had read. He was determined to ask him to afford his assistance. The results of the experiments had been the following:—Generally speaking, it took no effect on male subjects, or if it did it was very slight, consisting of slight twitchings of the muscles, a feeling of fullness, and gasping, or catching of the breath,—in many cases not even as much effect as this. These effects were not, however, imaginary; he (Dr. E.) had felt them, and he had expected, rather to go to sleep, if there had been any effect. Some, however, went to sleep, who had made up their minds that no effect could be produced, and had determined to resist it if possible. A great number of female patients had been sent to sleep, and so had one male epileptic for the space of ten minutes, not longer; he was, however, decidedly asleep. This effect was all that was produced in him, and this did not always occur. The experiments had been tried on three girls, one of them epileptic, and two of them hysterical. In the first case the girl was sent into a state of decided coma; she had no sensation; she was pricked with pins, and suffered no pain; she did not feel when her hair was pulled. During the time the influence lasted she kept

rolling her eyes, or moving her lower lip up and down; when the eyes were still the lip moved, and *vice versa*. Nothing but coma was produced in this case, but she could not open her eyes by herself, nor by transverse movements across them, except these movements were made by the magnetiser himself, as no one else in performing this manipulation succeeded. This was tried repeatedly, and found always to be the case, while the magnetiser succeeded instantly.

With regard to the patient he first mentioned, the effects were most decided; she did not fall into the ecstasy directly after she was magnetised, but the change in the fits came on after she had been magnetised several times. Hence it was not an immediate effect of the process, though it had been produced by it. The paroxysms were, however, decidedly put an end to by magnetism. She would sit during the manipulations, and talk as ramblingly as possible, and be exceedingly abusive, then all at once she would stare about her, close her eyes for a moment, and be quite well again. Now she was brought out of the attacks so repeatedly and so decidedly, that there could be no doubt that the magnetism produced the effects. There was no imagination acting here, as they had seen her when she sat down, restless and abusive, not knowing that she was to be brought to herself; indeed, not knowing that she was not herself. She only came out of the fits once or twice without magnetism, but was brought out of them three-fourths of the times by that agency, when it was employed, and she had never, he believed, been brought out of the ecstatic delirium without it. Many persons had been convinced of the effects of magnetism by this case, who had not believed in it when only sleep was produced. There was no collusion, he felt convinced, in this case. Another patient, a girl, had been sent into a state of coma by means of magnetism; no pricking with pins, or pulling of her hair, would bring her out of that state. There was, therefore, no doubt that a coma, similar to that of epilepsy, could be produced by magnetism. Her jaw was so fixed that it could not be drawn down by the force of the hand, but when a few transverse motions were made over it, it gave way directly. This girl could not open her eyes until they had been magnetised. There was no deception practised in these things. Baron Dupotet said he would open one sense while the others remained shut. He placed his finger in one of her ears and she heard slightly at first; she then began to hear better, and gradually got to the full sense of hearing, and answered questions; and the last time not only spoke, but fell into a violent rage, and shook an individual who had offended her, with great force; she sat down looking the picture of rage, her lips white, and she trembling all over with passion. She was awoke by a few transverse motions over the eyes, and knew nothing of what had occurred during the state of insensibility.

Now, so far as these facts had gone, that is, those that had come under his own notice, he (Dr E.) believed in what he should call Mesmerism, for Mesmer might be considered the second founder of the system. He (Dr E.) was never ashamed to declare what he believed; he had little respect for authority when he saw facts like those he had observed in the cases manipulated on by Baron Dupotet; he must believe them. The whole profession might laugh, but he must believe that there was a peculiar power which gave rise to the phenomena which he had observed, and that it was not sufficiently known or appreciated. They were not however, without the authority of great men, as believers in Mesmerism. Laplace, the great mathematician, second only to Newton, thus expresses himself concerning it;—"Of all the instruments which we can employ, in order to enable us to discover the imperceptible agents of nature, the nerves are the most sensible; especially when their sensibility is exalted by particular causes. It is by means of them we have discovered the slight electricity which is developed by the contact of two heterogeneous metals. The singular phenomena which result from the extreme sensibility in the nerves of particular individuals, have given birth to the various opinions relative to the existence of a new agent, which has been denominated animal magnetism, to the action of the common magnetism, to the action of the mineral magnetism, and to the influence of the sun and moon in some nervous affections; and, lastly, to the impressions which may be experienced from the proximity

of the metals, or of running water. It is natural to suppose that the action of these causes is very feeble, and may be easily disturbed by accidental circumstances; but because in some cases it has not been manifested at all, we are not to conclude it has no existence; and we are so far from being acquainted with all the agents of nature, and their different modes of action, that it would be quite unphilosophical to deny the existence of the phenomena, merely because they are inexplicable in the present state of our knowledge." Cuvier, also, fully admits animal magnetism. "We must confess," says he, "that it is very difficult in the experiments, which have for their object the action that the nervous system of two different individuals can exercise one upon the other, to distinguish the effect of the individual upon whom the experiment is tried, from the physical results produced by the person who acts for him. The effects however, on persons ignorant of the agency, and upon individuals whom the operation itself has deprived of consciousness, and these other animals present, do not permit us to doubt, that the proximity of two animated bodies in certain positions, combined with certain movements, have a real effect, independently of all participation of the fancy. It appears also, clearly, that these effects arise from some nervous connection which is established between the nervous systems." With the authority of two such individuals, said Dr. ELLIOTSON, one of them a profound mathematician, the other a distinguished naturalist, there could be no disgrace in taking the trouble to inquire into the effects of Mesmerism; not, of course, going to anything supernatural, but only as to its production of such effects as we observed in other cases, such as sleep, coma, sleep-waking, loss of power and sensation in the limbs, &c.; these we often saw. So, also, we had seen persons who appeared to be asleep, but who were sensible to external objects; and again, we saw some faculties possessing extraordinary sensibility, while others were more obtuse than natural. This was the extent to which the inquiry would be carried.—*The Lancet*.

THE TRANSCENDENTALIST'S APOLOGY.

I HAVE heard from several quarters that my dialogues have by some been reckoned unintelligible, and by others accounted mere verbal disputations. For this reason I have deemed it expedient to take a review of all my dialogues, showing the purpose of each, that I may thereby assist those who *really* do not understand them; and show to those who call them merely verbal disputations, how much they are in the wrong.

There are, however, certain of my readers who not only understand these dialogues, but extract from them a profound meaning which was never in the mind of their author. I do not mean that they have *perverted* my meaning, but they have penetrated the scanty surface spread by me (and which I was not aware concealed anything), and held up to my eyes a store of rich and mysterious treasure. This party has my sincere and heartfelt thanks; its members have been the most constant readers of my papers, and have taken the greatest pains to communicate to me their own profound and original thoughts. They are but little known to the common pursuers of what is now called philosophy, but they are the honourable successors of the "salt of the earth," as manifested at different times, and on different occasions, and though heaven and earth (*i. e.* lip-religions and worldly pursuits) pass away, they shall not pass away.

To this class of readers I have to make an apology *for my apology*, for explaining that which they already understand; but I hope they will find some use in my summary, as presenting the contents of the whole of my dialogues to one glance, and thereby rendering reference easy.

Dialogues I., II., III., are occupied with the enquiry whether there is to be found anything corresponding to the word "one." Every word is symbolical of a conception or an idea, and hence our inquiry is not directed to the etymological meaning of the word "one;" but we seek for an idea to which the word "one" may be applied, or whether it be void of signification altogether. It is not respecting the mere use of a word that we inquire, but about the being, or non-being of an

idea or a phenomenon. We take a lump of wood, and find that it is a one; we now ask ourselves in what consists its oneness when it is at the same time a "many;" and if we are answered that a "one" is but a "many" united, we must still remain unsatisfied; since, if we ask what is a "many,"—the answer will be a multiplicity of "ones." Hence we proceeded to look after a fundamental one, which should lie at the basis of the many, but not be itself resolvable. A mere self-subsisting, indivisible one, was, as we discovered, not to be found in the sensible world, and on enquiry further, we found that such a thing was impossible, as involving a contradiction *in se*. Having thus decided that a self-subsisting, indivisible "one" was not to be found, we turned our attention again to the piece of wood, and asked in what its oneness consisted. We admitted that it was a one and a many; but how was it even such a "one" as it was? The answer was—on account of the connection of the many the union constituted the one. We then discovered that the union consisted not in any physical power. We had arrived at the conclusion—an union makes a one of a many; the question that remained was—What is the unit? what is the bond that makes one bundle of the many? That some superficial readers, finding I was searching for an adequate idea corresponding to the word "one," should, on a passing glance, call the discussion in the first three dialogues merely verbal, I am not surprised. But why they should say the same of the subsequent dialogues, where the use of words was scarcely hinted at, I am at a loss even to imagine.

Dialogue IV., contained a hint that "oneness" came rather from the percipient than the thing perceived. It showed that anything short of the whole universe, being merely a portion of a larger mass, an active being, a percipient, was necessary to draw the line which should separate it from the rest of the mass, and constitute it a distinct one portion.

Dialogue V. illustrated this subject by the diagram of a straight line, and then described the process of apprehension, viz. that first the imaging-power (*Einbildungskraft*) went on "dot, dot," along the line which should cut the portion from the rest of the mass, and that afterwards the understanding stopping its progress, declared that so much and no more of what it had added up should form one object. This was illustrated by a familiar example of counting halfpence.

Dialogue VI.—In this a doubt was started whether it was right to consider undivided bodies as composed of smaller particles, and whether the whole might not exist prior to the parts which arose from actual division. The *Materialist* then thinks, that though a percipient is necessary to constitute a portion of the universe, the universe itself may be a one, not composed of, but merely resolvable into particles, and consequently independent of a percipient.

Dialogues VII. and VIII. are a familiar exposition of part of the doctrines of Kant's *Critik der reinen Vernunft*. "Universe," meaning the sum total of sensible objects, is considered as without a meaning for us. It must either be infinite or finite. If infinite, as apprehension is successive, it would require an infinite time to apprehend, and hence its apprehension is impossible. If finite, it must be bounded by something, and as the bound of a corporeal thing is an other corporeal thing, of course it will not be the whole universe. Hence the word universe is without meaning to the mere understanding; unless, indeed, we give it the mere negative meaning of that which remains after a portion is grasped by the understanding, and which, together with that portion, is looked upon by some power as always necessary to the existence of the portion.

Dialogues IX. and X. show that the imaging-power, in producing a finite body, or phenomenon, has already passed the bounds of such body; that hence the imaging-power was always in advance of the understanding or bound-setter. It was discovered that there was something present to the consciousness that was not grasped by the understanding; that there was a something which seemed an object and a non-object at the same time. That there was a faculty beyond the understanding, apparently in opposition to the understanding, and yet without which the understanding could not perform its functions. This part I endeavoured to render clear by a diagram, and to explain it more clearly is out of my power. I doubt

not, that to some of my readers these two dialogues were exceedingly difficult. The object of them can only be seen from a peculiar point of view, and that unless that particular point be gained all investigation is useless. All the dialogues but these two are, I conceive, so easy that a child might understand them with attention.

It will now, I hope, be seen from this short survey, that my object has not been to dispute about the mere meaning of words; but rather that I have come to the conclusion that there is a higher faculty than the understanding; that the great mathematicians, chemists, geologists, &c., if they pursue nothing higher than their sciences, are but unworthy representations of humanity, as they merely cultivate those things that can be grasped by the understanding, instead of inquiring whence the understanding itself proceeds, while all the while the fact that they are in possession of higher faculties is staring them full in the face. "The light shineth in darkness, and the darkness comprehendeth it not." "Ah!" cries somebody, "that verse only refers to the rejection of Jesus Christ by the Jews." My good friend, it is not till some verses below that we learn that "the word was made flesh;" it shone in darkness from the beginning.

THE TRANSCENDENTALIST.

N.B. I hope to continue my dialogues next week.

TO CORRESPONDENTS.

The Lecture on Animal Magnetism, which occurs more space than we expected, has obliged us to defer till next week our Correspondents' letters. Having entered so minutely into the subject of Magnetism, in the first volume of the Shepherd, we were anxious to give the lecture entire, as published in the Lancet. Much of the professional portion of it may be uninteresting to the readers of the Shepherd, but ample compensation will be made by the remainder, which is peculiarly interesting. We have the same opinion of Animal Magnetism that we have of Phrenology, viz. that it is an incipient science, which is only rendered ridiculous by the ignorance and extravagance of its over-enthusiastic disciples.

Aquatinta.—Our Fair Correspondent will derive much satisfaction, as well as instruction, from Porphyry's Treatise on Animal Food, where total abstinence is recommended, in a most elegant and fascinating style of language. The work is translated into English by Taylor, the celebrated Greek scholar. There is also an interesting scientific discourse on the subject, by Professor Donovan, in Lardner's Cabinet Cyclopædia, Domestic Economy, vol. 2, where plenty of minute arguments on both sides may be found. True, Nature teaches both good and evil, and, therefore, in one sense, the voice of Nature is not a criterion of good; the judgment must decide; but whenever the voice of Nature is absolute, we may be certain that the evil it occasions is not absolute, but only relative evil. If it be an absolute law of Nature that animal food be eaten, it is more merciful to eat than to abstain—if not, then it is doubtful.

P. T. S.—Mr. Smith will give a copy of the first and second volumes of the Shepherd, (gratis) to any Mechanic's Library, or Institution, that applies for it, through the Secretary, or any respectable referee in the metropolis. As, however, he himself will be at the expense of the binding, he hopes to be relieved from the expense of postage. The same parties will also receive the third volume, when it is completed.

Sold by Watts, 14, Snow-hill, Birmingham, and Heywood, Oldham-street, Manchester; Baker, St. Nicholas-street, Worcester; France, 87, Side, Newcastle-upon-Tyne; Smith, Tradesman's Mart, Nottingham; Tinker, Huddersfield; Chappell, Southey's-buildings, Bristol; Riches, St. George's Bridge-street, Norwich; Pring, 7, Turner's-buildings, Exeter; Marmont, Nelson-street, Stroudwater; Cousins, Half-moon-court, Tiverton; Bird, Cox-lane, Ipswich; Blackshaw, Edward-street, Stockport.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 14, Vol. III.]

SATURDAY, SEPTEMBER 30, 1837.

[PRICE 1½d.]

THE CATHOLIC AND THE PROTESTANT PRINCIPLE COMPARED.

The Commonwealth of Kings, the men of Rome!

And ever since, and now, fair Italy,

Thou art the garden of the world, the home

Of all Art yields, and Nature can decree.

Even in thy desert, what is like to thee?

Thy very weeds are beautiful, thy waste

More rich than other climes' fertility.

Thy wreck a glory, and thy ruin graced

With an immaculate charm, which cannot be defaced.

Byron.

THE characteristic distinction between the Protestant and Catholic principle is this, that the Catholic maintains the supreme authority of the Church, and the Protestant claims the privilege, and maintains the authority, of private judgment.

A perfect social union would necessarily reconcile both species of authority; but, as perfection is beyond the hope of created beings, it becomes our duty to inquire into the comparative merits of the two systems.

It is clear enough, from the very terms of the two expressions, "public opinion," and "private opinion," that the Catholic doctrine has a greater tendency to unity than the Protestant. Were every man who seeks truth privately, certain of finding it, and of finding it also in such a way as to harmonize with the truth as his neighbour has found it, there would be no difference between public and private opinion. But it is a law of our nature, that private individuals shall only discover truth partially, and, therefore, public opinion being the aggregate of private, is considered superior on all questions of a moral nature, on which individual experience is equally divided.

In a former article on this subject, we expressed ourselves in such a manner, in favour of the Catholic doctrine of faith and obedience to the voice of God, as revealed in the united Church, that, in this Protestant land, where people are necessarily precluded from hearing Catholic ideas expressed, we were accused of teaching Atheism under the guise of Catholicity! Why? Because, instead of recommending men and women to seek God for themselves, we enforced the necessity of social union to determine, finally, all questions relative to practical religion; thus recommending men and women not to follow individual vagaries, and sectarian peculiarities, but to endeavour to organize society into such a united form, that individual will and authority, on all moral and religious questions, would be entirely lost in the absorbing influence of public opinion.

Mr. Owen has, in our opinion, laid down the outward form in which this visible Church might be organized. Plato, Sir Thomas More, and others, have also done the same. We do not mean to propose any particular plan of our own, because we do not consider ourselves at present vested with any Catholic authority for inventing modes of moral association. We only refer the reader to these, as models to assist his imagination, in forming a conception of what we mean; with this specific exception, that these plans above mentioned want the Catholic idea of a supreme head, as the visible representative of God upon earth.

This the old Catholic Church possesses; but the Catholic Church is deficient in a point of immense importance, which these others have appropriated, namely, the universal sovereignty, which includes every member of the Church as an active and ruling member of the body politic.

It is a most unfortunate peculiarity of the present state of society, that there is a party within it which is moving forward in advance of another party, by means which necessarily depress and retard the progress of that party which they excel. The lower classes of modern civilization are repelled backwards by the same power which propels the higher classes forwards, and the jealousy that subsists between the two is such, that that which is adopted by the lower, becomes immediately contemptible to the higher, and the two poles react upon each other in such a way, that if the lower classes become infidels, the higher classes profess to be religious, and *vice versa*.

With this polar re-action progress is, notwithstanding, still taking place. Society is advancing, but it is advancing by antipathy, or *dissent*, instead of sympathy. Could this progress not be carried on by sympathy better than by antipathy? At present the power belongs to one party only, and jealousy is aroused in both. Did the power belong to both parties equally, love or sympathy would be created between both. Progress then would not only not be retarded, but wonderfully accelerated, because jealousy being removed on the part of the less advanced, and no sinister or selfish object being contemplated, or even attainable, on the part of the more advanced, the experience of the wise, and the benevolence of the good, would then have free scope for action, which is impossible at present. The voice of wisdom is now drowned in the jealousy of poverty or party spirit, and the whispers of benevolence are mistaken for the snares and the tricks of selfish policy. Wisdom would then have authority, virtue would then have authority, authority sanctioned by the public sense, which, when delivered from the obscuring mists of suspicion is always capable of discerning the difference between wisdom and folly, virtue and vice. Oppression begets jealousy, jealousy begets prejudice, and prejudice is obstinacy and irrationality. We may trace all the moral evils of society to the perverting influence of a stupid system of social government, and distribution of power and wealth. A great proportion of what is generally attributed to original sin is occasioned by this only.

In such a social organization it is evident that private opinion would hold a subordinate place, without being suppressed or even fettered. It would feel its inferiority; but believing it to be possible always to improve the human mind, and the forms of social intercourse, it would still continue to discuss the propriety of changing them. There would, however, be this decided difference between such discussions in a Catholic or social system, and those under a system such as we now repine in, that the former would be carried on with great temperance, mildness, and patience, without any vicious excitement of jealousy, or any heavings of passion on account of oppression or political extortion, and the ear of every listener would be open to conviction, by being solely occupied with the intrinsic merits of the question, and totally unbiassed by any personal suspicions or party animosities. Or should such a thing as party

spirit arise to a certain extent, as it most probably would, it would be a spirit of an intellectual and moral character, entirely disconnected with the corrupting influence of private or selfish interests, such as those which now gnaw the root of all social morality, and all public virtue.

Such a system is what we call a Catholic system, in which the voice of the Church* is supreme, and the voice of individuals is allowed the utmost liberty of critical comment for the sake of public instruction and universal and contemporaneous progression.

Now we affirm that it would be impossible to dissent from such a system. What would be the object of dissent? what could a Dissenter do by going out? What privilege could he gain? What end could be obtained? The Protestants came out of the Roman Church because they were not allowed freedom of speech, and because the Pope was elected by a junta. Had it not been for these two facts, there never would have been a Protestant Church. Luther would have preached undisturbed and still professed himself a faithful son of the church; and men would fearlessly have listened to Luther, and no formal separation would have taken place, but discontentment would have spread over the whole ecclesiastical body, the court of Rome would have felt its power, and the contemplated Reform would have been effected without a single rent in the holy garments of the Mother Church. It was the want of Catholicity *in form* that destroyed the Church. Catholicity *in form* would produce Catholicity in spirit, and Catholicity in form must be effected long before the Catholicity in spirit be engendered; the child is formed bodily first and spiritually afterwards.

A Church so constituted is infallible to all intents and purposes. It is the regeneration of society; and it is the only means by which individual regeneration can be effected.

How infinitely superior such an idea is to that Protestant system of working individually, by preaching to men and women in chapels and closets, proselytizing, and persuading them that they are regenerated or will be regenerated if they believe this, or do that, or give themselves passively up to God to be generated anew! This Protestant notion of regeneration is an illusion, and lucky for mankind that it is so. Why should one, two, or three, or more individuals, be regenerated in the midst of an unregenerate world? We need not say why, but we may rather say how is it possible, and can a regenerate man be comfortable in an unregenerate world? The more regenerate he is, the more miserable he must be, because the more unlike, and the more at variance with, the world he lives in. No: there may be feelings, convictions and impressions of a peculiar nature which men, if they choose, may call regeneration, or what they please, but our idea of a purified heart, and a polished head, is so infinitely beyond any such paltry specimens of regeneration as we have ever witnessed, that we should pity ourselves for our low and vulgar estimate of moral excellence, if we dignified them by any other name than "peculiarities."

Every species of devotion has been put in practice to accomplish regeneration upon *private* principles. St. Jerome says that God delights in the rumbling of an empty belly—" *intestinatorum nostrorum rugitus et inavitate ventris delectetur*,"† "and the angelic rule of Tabenne," says Gibbon, "condemned the salutary custom of bathing the limbs with water and anointing them with oil." The system of La Trappe is everlasting silence. Some become Nazarites, and cease to shave or crop their hair—others lie on ropes, and knotted boards, and hard pebbles. Pascal wore an iron girdle, with prickles on the inner surface, which was only discovered after death, sticking to his flesh! The Dervishes in the East spin themselves round on their heels till they cannot stand still; they then sick and fall into divine vision! Some mystics of old used to sit for three days in the corner of a room looking at their navels—on the third day they discovered God. All these are anti-catholic, or private modes of seeking God, and as long as men do seek God privately, they will be led into these or other equally useless excesses. Association corrects all such extravagances of

manner, by creating an authority which is the very highest authority which can be obtained for the practical purposes of social government, for man is the Lord of this lower world, to whom all power and judgment is given under the Father, who judgeth not except through this medium.

To deny this Catholic doctrine, therefore, is indirectly to reject Christianity. Protestantism is not a Church, it is a system of confusion—a scattering of the flock—a rejection of authority—and opens the way for every species of extravagance which the human mind, when left alone, is prone to commit. There was much of this Protestant spirit in the old Catholic Church. The monks were all Protestants; they were even exempted from episcopal jurisdiction more than a thousand years ago. (See Mosheim, Century 7th, chap. 2.) The remainder of Catholicism is Catholic more in name than reality; still it presents an imperfect model of an organization for a new Christian Church, which we can find in no other community. Its principal constitutional defect, at present, is the want of popular influence, which destroys its progressive character, and creates an anachronism of Church discipline and doctrine, which can only be removed by a system of mutation and progression, in concurrence with the modifications which are ever taking place in the social habits and intellectual exercises of mankind.

THE POPERY OF OXFORD AND THE NEW CHURCH PARTY.

(See Number 11, Vol. 3.)

IN a former number we took a superficial glance of a new and interesting discussion, which has been started in the Universities, respecting the character and doctrines of the Catholic Church. It has originated with what the staunch Protestant will call a heresy—and the Catholic, a symptom of pious remorse, and retreat to the true faith. Peter Maurice sadly deplores these Catholic symptoms, and puts up the prayer of Protestant orthodoxy to the Father of Spirits, that he would check the growth of the Great Antichristian Apostasy, and preserve unsullied the virgin purity of the English spouse of the Divine Redeemer, who established her own political liberty, like all other Protestant spouses and concubines, by the murderous instrumentality of gunpowder and steel. Yet Peter acknowledges that the Catholics "hold many of the grand truths of the Gospel," "*though in unrighteousness*." They believe in original sin, in justification by faith, and sanctification by the Spirit, and in the doctrine of election, all in unrighteousness! Moreover, they are scrupulously observant of the Lord's day, and, "*in their family and social devotions equally remarkable*," in unrighteousness! "Here, too," says Maurice, "they may, I regret to add, put the nominal Christian to the blush. It will suffice to mention one instance, though it is by no means a solitary one. I was informed, by a person who had a Roman Catholic lady lodging for some length of time in her house, of a fact I can never forget, and which makes my heart bleed for them, *knowing, as I do*, that they are under such a strong and perilous delusion. This lady was wont regularly, *morning, noon, and night*, to assemble her little family, seven interesting children, and kneel down along with them, their infant hands clasped together, their eyes uplifted in all the earnestness of childlike simplicity, herself in the centre, conducting their devotions, I could not refrain from exclaiming, '*O that she was but a believer in Jesus of Nazareth, and was led to put her trust solely in his merits, and not in saints! O that Protestant mothers were all, or many of them, like this Roman Catholic!*'" What a pity it is that those prayers which the innocent little children repeated, were not Protestant prayers! How very angry the Almighty must be with the dear little babes, with their clasped hands, repeating Popish liturgies, and approaching, in filial love and confidence, the Father of Spirits with *Popish piety* in their hearts! Yet Peter regrets the spreading of this religion, although, according to his own acknowledgment, the villages around Oxford are in a most deplorable state of ignorance and darkness, and the *Church-of-England-men* are to be seen working in their gardens on a Sun-

* We call such a system of society a Church, because it is a moral government.

† Opera, vol. i. p. 137.

day, while the *Church-of-England-women* are engaged at home on the same holy day, baking, brewing, and washing!

Maurice is not sufficiently cool for exposing the Popery of the new school; we have, therefore, accepted the aid of an anonymous writer, who has made a very interesting selection of passages from the Tracts,* from which we select the following:—

"How miserably contrasted are we with the One Holy Apostolic Church of old, which, serving with one consent, spoke 'a pure language,' and now that Rome has added, and we have omitted, in the catalogue of sacred doctrines, what is left to us but to turn our eyes sorrowfully and reverently to those ancient times, and with Bishop Ken, make it our profession to live and die in the faith of the Catholic Church, before the *Division of the East and West*."

By the Catholic Church they mean, therefore, not the Roman Catholic, but the three-fold Church, Grecian, Roman, and Protestant. It is melancholy to think, however, that this beautiful complaint of the apostasy of the Universal Church, which sounds so musically in the ear, in its vague and general meaning, should turn out, when further illustrated, to be merely a solemn dirge, not over the apostasy of the Church from the social morality of universal brotherhood, but over the loss of a few trinkets and vestments, and the discontinuance of some childish forms, which have enraptured the fancy of the Hebrew Professor, and his learned, his eloquent, and his pious associates. What has the English Church omitted of the ancient Christianity? Let us hear:—

"For example, that not most men maintain, on the first view of the subject, that to administer the Lord's Supper to infants, or to the dying and *insensible*, however consistently pious and believing in their past lives, was a superstition? and yet both practices have the sanction of primitive ages."

On the subject of *praying for the dead*, the Tracts, as usual, refer for authority to the primitive Church. "All the liturgies now existing, or which can be proved to have existed, contain a prayer which has been excluded from the English ritual, for the rest and peace of all who have departed this life in God's faith and fear."

These Catholic gentlemen also maintain, by the same authority of antiquity, that the Eucharist is a real sacrifice. On a comparison of the different forms of oblation and consecration, it will be seen that in each of the four original liturgies the Eucharist is regarded as a mystery and a sacrifice.

"E. g. (that is '*exempli gratia*,' for example) in the ROMAN FORM, translated from a missal now in use in the Church of Rome. 'We offer unto thy glorious Majesty, of thine own gifts and presents a pure host, a holy host, an immaculate host,' &c."

"THE ORIENTAL FORM.—'We sinners offer unto thee, O Lord, this tremendous and unbloody sacrifice,' &c."

"THE EGYPTIAN FORM.—'Sanctify and thoroughly consecrate them, making the bread the body, and the cup the blood,' &c."

"THE GALILICAN FORM.—'Sanctify these hosts, &c., that they may confer eternal life and an everlasting Kingdom on us who are going to eat and drink of them in the transformation of the body and blood of our Lord Jesus Christ, thine only begotten Son.'

"Such is the view taken of the consecration and oblation of the Eucharist in the four independent Christian liturgies. It is well worth the consideration of such Protestants as have *rejected the ancient forms*!"

These Tract and Popish gentlemen speak of the clergy as entrusted with the keys of heaven and hell, as the heralds of mercy, as the denouncers of woe to wicked men, as entrusted with the awful and mysterious gift of making the bread and wine Christ's body and blood. All this authority is transmitted to them by spiritual descent, that is, ordination,—derived not from the body of the Church upwards, but from St. Peter downwards, by apostolical succession. How strangely and dis-

cordantly these childish and exterior views of Christianity jar with the following beautiful sentiments which betray feelings of a purer spirit of Christianity than is commonly prevalent in Christendom, &c. The affections are placed above the intellect. Creeds and articles of faith, though regarded as divine inspirations, are regarded by them as inferior and subordinate departments of religion. "And thus much on the importance of creeds to tranquillize the mind; the text of Scripture being addressed principally to the affections, and though definite according to the criterion of *practical* influence, vague and incomplete in the judgment of the intellect." "Nor in the next place is an assent to the text of Scripture sufficient for the purposes of Christian fellowship. As the sacred text was not intended to satisfy the intellect, neither was it given as a test of the religious temper which it forms, and of which it was an expression." Still we are told that the articles of the Church are as much a part of the Christian religion as the Bible itself, and that there is not a Dissenter living but inasmuch and so far as he dissents, is in a sin. This would be all very true, provided the Church were constituted upon the principles of social love; but the tracts merely inculcate this love in a very general and vague manner, and make no allusion to the practical *asystematic* method of creating love according to the model of the early Christians.

But, strange to say, this new Catholic party talk of the divine dispensation of Paganism, and the scattered fragments of truths—pilgrim truths up and down the world, a sort of *traditional* religion revealed to all men, and to be found in every nation! Nay, they even acknowledge the truth of all articles of faith in various degrees of divinity. "But, indeed, not our own articles only, though they claim authority in a more high and especial sense; but all creeds, confessions, formularies of doctrine, and summaries of Christian education, which come from bodies of Christians, are valuable in the same manner. *They ought all to be maintained*." This ultra-liberalism, strange to tell, serves as an apology for excluding Dissenters from the colleges! The above extract is taken from "Thoughts on Subscription," by Sewell, one of the new Catholic party.

The revival of the Popish habit of the priest, and his turning his back to the congregation during prayers, on which occasion he exhibits a large cross on his back, is another proof of the backsliding tendency of Protestantism in Oxford. "A long strip of silk," says Mr. Maurice, "about two inches and a half in width is thrown over the left shoulder, where it is fastened by a pin or button, and extends downwards to the bottom of the surplice, before and behind, with a fringe of the same material at each end, and a cross of black silk, raised or embossed, just above the fringed border, the arms of the cross being extended cornerwise, or in the shape of the martyr's, or St. Andrew's cross." All this is performed by Mr. Newman in the Church of St. Mary the Virgin, where the whole collegiate establishment attends to hear the university sermons; but the exhibition is only made in the Church in its parochial capacity. This same Newman is he who extols the character of Mary the Virgin so high as to leave it doubtful whether he does not regard her as an intermediate being between a woman and a divinity.

Upon the whole, we must confess that there are many beautiful sentiments uttered by this new Catholic party, but they are wrapped up in such a mass of rude matter, and filthy rags of ceremonial righteousness, that we can have little fellow feeling with it. But we rejoice in its existence, for, in the first place, it tends, like all other divisions, to crumble the tower of Babel; and, in the second place, it directs the religious public to the contemplation of Catholic ideas which cannot fail ultimately to beget a desire for a universal union of the Christian Church upon social principles. They are treading upon our own premises, and propagating, under cover, many of the standard doctrines of pure universalism. In fine, they are Universalists professedly, but have not yet escaped from the slavish fear which necessarily attends erroneous ideas of the origin of evil. With them *Nature* is still one power, and *God* another. This Atheistic basis must eventually destroy them. Faith and unity, or the Church, can rest on nothing but Pantheism. 1 Cor. xv. 28. The final restoration of the Church makes God all in all. "*Te panta en pasi*, i. e. "*all things in all things*." The

* Specimens of the Theological Teaching of certain Members of the Corpus Committee at Oxford. Fellows, Ludgate Street, 1836.

same is said of Christ. Col. iii. 11. This destroys evil, whose existence is kept up by giving it a separate origin, and thus begetting an accusing spirit, and an unsocial system of intercourse. There is no *absolute* evil. In the absolute sense God is not, and cannot be the author of evil. Evil has only a relative existence, and this relative evil is only to be destroyed by the social and moral union of the Church. This is the final purpose of God, "that in the dispensation of the *fulness of time*, he might gather together *in one all things in Christ*, both which are in heaven, and which are on earth; *even in him*". Eph. i. 10.

THE MORMONITES.

THE Mormonites are a new religious sect in America, who, like the Irvingites in England, are directed by the Spirit of Prophecy, or Direct Revelation. They have, within these few weeks or months past, sent seven apostles to this country, who, we believe, are at present in Lancashire, and are about to perambulate the cities, towns, and villages of this unholy land, for disciples to the new and *only true* faith. They have already made several disciples in Preston, who have undergone afresh the rite of baptism, and called themselves by the name of Mormon.

They have a book, which is called the Book of Mormon. It is tolerably large, and contains a curious, but not very interesting history of a people we never heard of before, and whose names are not to be found in the chronicles of Judah, or Israel, or Babylon the Great, the Mother of Harlots, or of any other religious or irreligious order that we are acquainted with. The book is said to be translated from an ancient relic, a piece of fossil literature, discovered by the founders of the sect, consisting of letters engraved upon plates, which plates were hid of old, and preserved by the divine vigilance, until their discovery by his chosen ones in the land of the free. The following is the testimony relative to the existence (material or spiritual we know not) of these plates, as they have been seen and handled by the witnesses. But we have seen and handled many things, whose existence it would be hard to demonstrate. Last night only we dreamed we were reading a book; the words and ideas were clear and connected; we distinctly pronounced them as we read aloud; and when we awoke, we repeated the last sentence awake, with a sort of admiration at the clearness of the vision. To us this book *was* a reality; but where is it now? It would certainly be more wonderful if half a dozen people had seen the same book, and read the same words. But even this we are prepared for, as we have no doubt of the *fact* of revelation, though we refuse to be guided by the literal or obvious meaning of it, or even to acknowledge that it must necessarily speak truth, until it has passed the tribunal of the Son of Man, viz. human intelligence, to whom all judgment is given.

The testimony of these witnesses is as follows:—

"Be it known unto all nations, kindreds, tongues, and people, unto whom this work shall come, that Joseph Smith, junior, the translator of this work, has shown unto us the plates of which hath been spoken, which have the appearance of gold; and as many of the leaves as the said Smith has translated we did handle with our hands; and we also saw the engravings thereon, all of which has the appearance of ancient work, and of curious workmanship. And this we bear record, with words of soberness, that the said Smith has shown unto us, for we have seen, and hefted, and know of a surety, that the said Smith has got the plates of which we have spoken; and we give our names unto the world, to witness unto the world that which we have seen, and we lie not, God bearing witness of it.

"CHRISTIAN WHITMER.
JACOB WHITMER.
PETER WHITMER, junior.
JOHN WHITMER.
JOSEPH SMITH, senior.
HYRUM SMITH.
SAMUEL H. SMITH."

Another testimony, signed by Oliver Cowderoy, David Whit-

mer, and Martin Harris, says that an angel of God came down from heaven, and brought the plates, and showed them to the three witnesses, with the engravings thereon.

This Book of Mormon contains "a record of the people of Nephi, and also of the Lamanites, written to the Lamanites, who are a remnant of the house of Israel; and also to Jew and Gentile, written by way of commandment, and also by the spirit of prophecy and revelation: written and sealed up, and *hid unto the Lord*, that they might not be destroyed, to come forth by the gift and power of God, unto the interpretation thereof. Sealed by the hand of Moroni, and hid up unto the Lord, to come forth in due time by the way of the Gentile, the interpretation thereof by the gift of God.

"Also a record of the people of Jared, who were scattered at the time the Lord confounded the language of the people, when they were building a tower to get to heaven."

Having made these preliminary remarks, we will now quote an article from the *Upper Canada Times*, of May 26th, 1836, relative to this new religious denomination. There is some rather hasty judgment, or uncharitable feeling, perceptible in the writer of it, in which we do not participate. But as the testimony of an American is of more value to the reader in a historical sense than our private opinion, we give the article verbatim, as we find it.

THE MORMONS.

"This sect is increasing rapidly in numbers, already amounting to more than twenty thousand persons. The settlement at Kirtland numbers about one thousand. There they have erected and nearly completed a huge stone temple at an expense of forty thousand dollars. Its dimensions are sixty by eighty feet, and fifty feet high. It is of no earthly order of architecture, but the prophet says it is exactly according to the pattern showed him, though it is by no means equal to that in splendour from the want of means. It appears to be of two stories, having two rows of Gothic windows running round it, besides windows projecting from the roof for the attic story. The first floor is the place of worship, and is completed in a very showy style, with four rows of pulpits at each end, having three pulpits in a row. These twelve pulpits rise behind and above one another, and are designed, the uppermost row, as they say, for the bishop and his counsellors; the second for the priest and his counsellors; the third for the teachers; the fourth or lowest for the deacons. Each end is provided in the same manner. The body of the house is occupied with slips, but the seats in them are moveable, so that the audience can sit facing either end of the room. Over the division between each of the rows of pulpits hangs a painted canvas rolled up to the ceiling, and to be let down at pleasure, so as to conceal the dignitaries behind from the audience. Similar curtains, or, as they are called, "veils," are disposed of over the room, so that it can at any time be divided into four apartments, to carry on the objects of the imposture. Every thing about the temple is evidently designed to strike the senses and attract curiosity; and at the dedication, which is to take place on next Sabbath, most astonishing "glories" are promised and expected by the faithful. The second floor and the attic loft are designed for a seminary literary and theological!

"They all have revelations continually, though the prophet alone is authorised to commit them to writing, for fear undoubtedly of discrepancies. Besides the Mormon Bible, they already have a book of Revelations.

"There is one great difference which ought to be mentioned between the revelation of Joseph Smith, jun. and that of Mohammed. The latter had at least the merit of a flowing and beautiful style. But there never was a more bald, senseless, drivelling collection of trash put together in the form of a book, than the Book of Mormon and the Supplementary Revelations. It is really astonishing, and it is humiliating to think that any human beings who have read the Bible can be so far deluded as to believe such a wretched farrago to be a divine revelation.

"In proportion to the strength of their faith, they pretend to have the power of working miracles, healing the sick, &c. of which they relate numberless instances, though nobody attests them besides themselves. But the more intelligent place but

little reliance upon either miracles or prophecy, for the purpose of convincing unbelievers, as they have so often attempted both without success; but rely chiefly on their own internal experience. What they know of course they know, and there is an end of the matter.

"That most of them sincerely believe in their mummeries cannot be denied. Some probably have attached themselves from other motives. Many are doubtless pious though deluded men. They furnish evidence of being, for the most part, men of perverted intellect, disordered piety, unfurnished minds, with no sound principles of religion, inclined to the mystical and dreamy, and ready to seize upon any thing, no matter how crazy or absurd, that will gratify their restless crazy piety, and bolster up their exorbitant spiritual pride. Such men always exist in every community, and are always the fit subjects for fanaticism and delusion. They call themselves "latter day saints," and profess to be the only true church, to have the only gospel order, consisting of apostles, elders, bishops, &c., which several orders of the Christian hierarchy have been distinctly brought to light in the Book of Mormon. They believe that there is no true church without apostles, prophets, miracles, tongues, &c., as they existed in the apostolical days, and to all of which they lay very positive claims. They lay great stress upon the promise, "These signs shall follow those that believe," &c.

"The inquiry instinctively arises, are they really so blinded and deluded as would seem, or are they a set of impostors? With respect to the great mass, I have before said that I believe they are no hypocrites, but genuine fanatics, completely blinded and deluded. But of the leaders I do not believe this is true.

"I had the honour of making some acquaintance with the illustrious prophet, Joe Smith, and his coadjutor Rigdon, and the other inferior satellites. Smith is apparently about thirty-five years of age, and is evidently a singular being. He is very plausible and polite in his manners, has an eye that glitters like a serpent's, and it is perpetually flying about to find some object on which to rest. His lips are firmly compressed, and he wears an eternal smile of self-complacency on his features, and has all the air of one who is conscious of having communion with invisible spirits, whether good or bad you are at a loss to determine. He has been a money-digger and necromancer from his youth, and his father before him. His character is undoubtedly about an equal compound of the impostor and the fanatic, and combines all the features of the knave and the duper.

"Rigdon is altogether another sort of man. He has been a Campbellite preacher of considerable talents and eloquence. He is a large, fat, jolly fellow, who knows how to turn his talents to the best account, and manifestly has not a particle of faith in the imposture, but practises it for purposes which he knows best. He was evidently as I talked with him, ashamed of the silly fooleries he was propagating, and took the earliest opportunity to make an excuse and leave the company. What an account such men will have to render to God at the day of retribution!"

ÆSTHETIC LETTERS; ON THE CULTIVATION OF THE HUMAN BEING.

BY SCHILLER.

LETTER V.

Is this the character that the present age, that passing events show us? I direct my attention immediately to the most prominent object in this extensive picture.

True it is, the authority of opinion is fallen, arbitrary will is unmasked, and although yet armed with power, flitches no more respect: man is awakened from his long indolence and self-deception, and with increasing urgency and energy of tone demands to be reinstated in his inalienable rights. But he does not merely make the demand on this side; and on that he stands up to take up by force what, in his opinion, is wrongfully withheld from him. The fabric of natural government totters, its rotten foundation gives way, and a physical possibility seems

to be afforded to place law upon the throne, to honour man by constituting him the ultimate object of his own existence, and to make true freedom the basis of political combination. Vain hope! The moral possibility is wanting, and the moment that promises us freedom finds a race incapable of receiving it.

Man depicts himself in his actions, and what is the form delineated in the drama of the present times? Here savage rudeness, there luxurious languishment; the two extremes of human debasement existing in conjunction.

In the lower and numerous classes are exhibited rude and lawless passions, which break forth as soon as the bonds of civil order are dissolved, and hasten with unmanageable fury to their brutal satisfaction. And thus, though objective humanity may have had cause to complain of government, the subjective is obliged to honour its institutions. Should it be blamed that it lost sight of the dignity of human nature, while it was concerned to defend its existence?—that it hastened to separate with the power of gravitation, and to hold together with that of cohesion, if the formative power was not yet conceived? Its dissolution contains its justification. Society, on being liberated from its bonds, instead of springing upwards by the power of organic life, falls back into the realm of elements.

On the other hand, the civilized classes present the yet more repulsive aspect of supineness and of depravity, which is the more disgusting, because cultivation itself is its source. I do not at present recollect which of the ancient or modern philosophers has made the remark, that the more noble any object may be, the more painfully do we behold its ruin; but this truth is experienced in the moral world. Licentiousness, which converts the son of Nature into a madman, makes the disciple of art a villain. The enlightenment of the understanding, on which the refined classes, not altogether without reason, pride themselves, is so far from displaying, in its collective force, an ennobling influence upon the sentiments, that, on the contrary, it confirms corruption by maxims. We renounce the sway of Nature in her legitimate field, to experience her tyranny in the moral: and whilst we are striving to resist her impressions, we take from her our principles. The affected decency of our manners refuses to her the first voice, which is unimpeachable, to the end that we may yield to her in our material ethics, the last which is decisive. In the bosom of the most refined sociality hath selfishness laid the foundation of her system; and without gaining from it one social heart, we experience all the infections and all the distresses of society. Our free judgment we subject to its despotical opinion, our feelings to its absurd customs, our will to its arrangements; only the determination of our will we maintain in opposition to its sacred rights. Haughty self-sufficiency contracts the heart of the worldling, which often beats with sympathy in the rude man of Nature; and each one, as in a burning city, strives to save only his own miserable property from the devastation. Only in an entire forswearing of sensibility is it believed that defence may be found against its errors; and the ridicule, which is often a wholesome corrective to the enthusiast, calumniates with as little tenderness the most honourable feelings. Cultivation, very far from placing us in freedom, only develops a new want with each power that it elaborates; physical constraints cling more gallingly around us, so that the fear of ruin smother even the fiery tendency to perfectibility; and the maxims of patient obedience are prized as the highest wisdom of life. Thus we see the spirit of the time wavering between perversion and rudeness, between the wholly unnatural and the barely natural state, between superstition and moral infidelity, and it is only the consideration of these evils that at times sets bounds to them.

THE TRANSCENDENTALIST'S DIALOGUES.

No. XI.

ON "FINITE BEINGS."—(Continued from p. 88.)

Transcendentalist discovered sitting alone.

Trans.—A pretty situation I am in! Here have I promised to continue my dialogues, and the deuce of a person comes to converse with me. A dialogue with one's-self would be rather Hibernian. Yet what am I to do? The Materialist, taking

advantage of the fine weather, is steaming away to Gravesend. (A knock). Come in!

Enter Idealist.

A stranger! Take a seat, I beg, Sir.

Ideal.—Though personally a stranger, I am intimate with your dialogues with the *Materialist*.

Trans.—Oh! I see, you have come to dispute with me on some point. You have not come from Chatham, have you?

Ideal.—No, nor have I come to dispute. I have merely called to express my entire concurrence with all that you say, and am happy to find a person precisely of my opinion.

Trans.—You do me infinite honour. May I ask what your opinions are?

Ideal.—Certainly. It is very clear that the mind knows nothing of matter, except through the medium of certain sensations. Or rather, I am wrong in talking of sensations as a medium, for we have no right to assume anything beyond these sensations. This talk is because we perceive it, were we not perceiving it, it would not be at all. And what is the talk? A combination of sensations made by ourselves; and what are sensations? Merely affections of ourselves. Hence, however the world may ridicule the opinion, it is very clear that there is really nothing but ourselves, although, as we undergo certain changes, now being affected with blue sensations, now with red, we, from an old-fashioned prejudice, ascribe them to something external to ourselves. But, thank God! we, who have learned to reflect, have got rid of these prejudices.

Trans.—Then I am to understand that all these things around us entirely depend on ourselves, but that we ourselves are entirely independent of them.

Ideal.—Exactly. While I look at this table it exists, but when I turn my back upon it, pop! it is gone, and the wall supplies its place; but I—I am independent, because, whether I look on the table or the wall, or any thing else, I remain the same. I walk into the fields, and my house passes away; I walk back to my house, and the fields pass away,—but, amid the general rise and fall, beginning and ending, creation and destruction, I stand firm as a rock.

Trans.—I am greatly obliged to you for this communication of your views, but I was not aware that I had promulgated any such opinions.

Ideal.—My dear Sir, you have not said the words, but all your dialogues have been directed to this one end. You have said that the object, as perceived, could not be without a perceiver. You have shown, that to the existence of any one finite body, the joint operation of the imaging-power and the understanding itself is requisite. You talk, indeed, of a mysterious, indefinite something, which is neither finite nor infinite; but how do you show it? Why, you show that the imaging-power is always passing the bounds set by the understanding. That is, you show that one of our faculties runs faster than another, not that there is anything independent of those faculties. Were it not for the imaging-power, you would never know any thing about this indefinite mass, from which the finite is, as it were, carved. Why should it not be the product of the imaging-power? That, indeed, I am convinced is the case—the imaging-power creates the indefinite, and the understanding creates the definite by setting limits. Thus do we, independent beings, by the aid of our own faculties alone, build up the whole multitude of sensible objects, we ourselves being the centres from which alone they derive their being.

Trans.—Bless my soul, what a magnificent edifice have we managed to construct, all that sky, and those fields, and those houses; and then, when night comes on, we shall, if we are lucky, contrive to make a moon. Ha! ha! ha! But seriously speaking, my dear fellow, you have altogether misunderstood me. I never considered myself to be an independent, all-evolving being, and I regret that any thing I have written should convey such an impression.

Ideal.—You surprise me! Have you not shown how the thing perceived could not be without the perceiver? Have you not shown that the same thing, seen from different points of view, is different to different perceivers?—That the circle is a circle, because some one looks straight upon it; but an eclipse, when some one looks obliquely upon it?

Trans.—I am aware of all this; I know that the things I see bear certain forms, merely because I regard them from certain points of view, and hence that if I did not regard them at all, they would not have these forms: but when did I speak of a perceiver, independent of the thing perceived?

Ideal.—You have not mentioned it; but, surely, it is obvious that the perceiver does not depend on the thing perceived.

Trans.—Not to me. But I see you draw your conclusion from its being indifferent to yourself, whether you behold the table or the wall.

Ideal.—That is how I draw it.

Trans.—Yes, but granting that you are independent of any one object, such as a table or a chair, it does not follow that you are independent of objects altogether. Turn from the table, you see the wall, turn further, you see the window, by this process you change one object for another, but you do not get rid of objects altogether.

Ideal.—But, if I shut my eyes?

Trans.—Why, then, if you are thinking at all, you are thinking of objects of some sort, and this depends on your having previously perceived these objects. The very creatures of imagination which you create and annihilate at pleasure, do not depend merely on yourself? Had you never seen a fish, nor a woman, you could not, even in your mind, form the fantastic image of a mermaid. The choice of objects of thought may, perhaps, depend on yourself alone; but certainly it does not rest with you alone whether you shall have objects or not.

Ideal.—Then if the perceiver depends on the perceived, and the perceived on the perceiver; what is independent?

Trans.—No finite being, and that we are finite every toothache or head-ache proves. I am aware that in the tenth dialogue I used the expression “we have an infinite power,” but this merely meant an infinitely-striving power, which we ourselves cannot check. It is the imaging power which goes on—on—on, and even this proves us to be finite beings. Let a body X move on from A, in the direction B,

A—————B.....

and never stop, but go on *ad infinitum* at the rate of fifty miles an hour. Here the body X so far as it moves on infinitely has an infinite power, but so far as it only moves on at a certain rate (fifty miles an hour) it is retained, a bound is set, which though it does not stop its course, is a check to its celerity. Thus it is with our imaging power, it goes on dot—dot—from one sensation to another, never stopping in its progress, but were we beings of infinite capacity, we should have no occasion for succession, there would be a perpetual presence, and no succession at all. We must talk of this hereafter, as we have by no means exhausted the subject. Materialism is a deadly system of Atheism, as it makes infinite dulness, the head of all things; but it is not a presumptuous doctrine, inasmuch as its professors acknowledge themselves a mere modification of this stupidity. But in *your* Idealism there are Atheism and presumption combined, as not only do you deny a Being superior to your own finite self, but make yourself the sole source of all things. A true philosophy has Materialism at one pole, Idealism at the other. Each one taken by itself is fallacious and Atheistical.

WHAT DO YOU MEAN BY EDUCATION?

After a little discourse between two parties on the subject they generally arrive at this question. Very often they may agree in principle, and differ in words. On the other hand, so long as only general terms are used, individual minds, opposite as the poles in reality, may appear to agree most harmoniously. This is observable in a very convincing manner on political and social subjects; especially on the side of complaint and pulling down. So long as reform is altogether denied every grade of reformers make common cause; they adopt some general expressions, and all seem to pull heartily in one direction. They all can honestly and co-operatively complain of everything that is done. But when a relaxation takes place, when some reform is granted, and a portion of the reformers are placed on the affirmative side, that is to say to become actors instead of

passive settlers up instead of complainers of institutions, then it is found that individuals and parties outwardly united, mean very different things by the same words.

There is scarcely a general proposition to which, if you let us attach our own meaning we cannot agree. The subject may be either political, moral, or religious; nay, two general propositions, apparently contradictory, and which have been used, time out of mind, to separate mankind into hostile parties, may be harmonized in the mind of one and the same individual. And that, two, without resorting to any time, serving accomodation. The vulgar public, as far as they know anything of such a mental condition, call it Jesuitical, double dealing, or by some epithet intended to be contemptuous and condemnatory, but which the said Jesuitical and duplex mind can complacently and kindly receive in a laudatory sense.

I look upon education, however, as too serious a public matter to be left unagreed, in this uncertain and wavering state. We must bring the public mind to a clear and determined position upon it. Almost every thinking man has the word in his mouth as representative of something to him most important and most real, and there is no reason why the subject should not, for the sake of the deepest human interests, be brought to issue. Moreover, it appears to me susceptible of the most lucid arrangement, so that no misunderstanding can possibly occur to any person who will use the scale I am now proposing for the purpose of bringing to the test any one who speaks or writes upon the subject.

When national education is spoken of in Parliament, it means reading and writing. The prime minister is careful to let it be known, he means no more than these lowest instrumental conditions of future working usefulness, lest it should be supposed that he is going "at one fell swoop" to push power from its tottering stool. If benevolent individuals set up a village school, it will go a little farther, and include the first questions in mental arithmetic, or some industrial instruction—still a working school, to fit the children for outward servitude, regardless of the only means of developing a consciousness of the real end of their existence. Here and there parties are found who tremblingly venture to suppose the practicability, and to introduce the experiment, of free thought; but the consequent outward vivacity and energy inducing the disapprobation of clerical and other friends, the school is soon restored to its primitive peace, rectitude, and simplicity.

If some have found that education, such as its professors give, poor or costly, whether on themselves or others, with all means and appliances of life at their command, has still left a deep want gnawing at their inmost heart, and have looked and felt around them in the mental world for means of relief, and development, and harmony for their deeper nature, they have rarely found it for themselves, and still more rarely have they been able to become the administering means to others. Yet education, to be true and really useful, must go as deep as this; aye and much deeper too.

But to come back again to my scale. I think it is extensive enough to take in all opinions and parties at present known; but I shall be glad to find any of your correspondents desire its prolongation, or rather, if I may so speak, its further profundation.

5. The preceding " " Feelings.
6. The preceding " " Human Instincts.
7. The preceding " " Conscience.

I dare not suppose your readers so obtuse as to require a grade for every mere modification, such as gymnastics, singing, drawing, history, or the usual school embellishments; though I am sorry to remark, that on modifications only many energetic public men occupy almost their whole attention. The difference between Bell and Lancaster, which is about the same as the money difference between twenty shillings and a sovereign, has been shamefully used to make divisions, which are not worthy of the slightest investigation. They, however, serve to divert the public from the true consideration of the subject, and most effectually to disgust the really unselfish, ardent minds,

who afterwards discover how they have been gulled into a waste of time, thought, and feeling.

But there yet remains a most important consideration, which involves results as deep and as opposite as those of life and death. It is one thing to write a book, and another thing to make a reader. Judging by the multitude of volumes already in print, the former is an easy task. How to increase readers to any good purpose, is yet an unsolved problem. My scale will only accomplish half its business, unless your printer will assist us in making a diagram, to show the two modes of reading it.

The parties who make reading and writing the basis of education, still verbally profess a regard to morals, but their ratio will be expressed with more than due favour, by a triangle, having its base at No. 1, with its point downwards, and vanishing before it reaches No. 7: while the parties who make No. 7 the basis of all their doing, will be represented by a similar figure, turned the other way up:—

The former may be called the disciplinarian mode, which, whether exhibited in National or Day Schools, or Colleges, or Universities; whether the price paid be a penny a-week, a shilling a-week, or a guinea a-day, is only a sepulchre, more or less polished, and, having death for its basis, has death for its result. You cannot livingly read inwards from without, any more than apples can grow in our trees inward from without. The scene-painter can produce an appearance by that process, so can the schoolmaster; but the apples of one, and the wisdom of the other, are heartless, loveless, useless appearances, which the true stomach, and the true mind, will equally reject.

The reverse mode of procedure, the only true reading, may be called the parental, the Platonic, the Socratic, the Christian, the Pestalozzian; no matter the name. The growth is outward from within. The life mode, not the death mode. Based on self-moral consciousness, involving the spontaneity of the feeling nature, with the actual harmony of mind and matter, supporting the power of expression in poetry and other arts: development of the intellectual nature, with its train of history, science, laws of mind and matter: development of the outward nature, with its consequences, reading, writing, drawing, &c., energy of body, adroitness in execution. Education, then, and not politics, is the subject on which the cry of "liberty or death" has a real meaning, coming home to every one of us.

Now, as "Education" will, in the mind of one speaker, go only as far as number one, while another goes as far as number three, and another to five; also another set of speakers, not only read to different numbers, but read altogether from a different side, like the difference between the Hebrew and the English modes of writing, it is essential to have at hand some such test as this, by which we can readily bring to issue what our friends design. It is desirable to do so, not only on account of clearness, but if the public mind gets fixed to one spot, it is more difficult to move to an improved ground, than if no position at all had been taken. Above all, when the public are allowed, unwarned, to adopt any defective principle as the correct foundation for national operations, and the day of failure arrives, immovable reproaches are heaped on the true principle, and on all that happens, by common usage, to be designated by the same word.

Therefore, do not let it be supposed that this is a whimsical, or merely metaphysical flight of mine, intended but to amuse the careless reader. On the contrary, I feel most forcefully that much mischief will result, if a national effort should be made to put down vice and crime by means of education, so long as it is confined to reading, writing, and such mere instru-

ments. Nay, let it extend to the whole apparatus of the university, it never can more than modify and refine vice and crime. Experience declares this. To abolish them, we must begin from the other end. We must, by an involution, for which I fear the public are at present little prepared, read our English ideas in the Hebrew style.

But I must conclude. We are often called on by disputants to define our terms: a sure symptom that the said disputants feel they have the worst of the argument. I have here endeavoured to pursue what I consider a superior course. The analysis of ideas is surely more valuable than verbal inquiries, and in every respect preferable to the definition of words. C. L.

PASTORAL NEGLIGENCE OF THE IRISH CHURCH.

THE Protestant clergy usually speak of themselves as a blessing to Ireland. In what respect they are so we know not. But there is one particular virtue, in which Protestantism prides itself, viz. the circulation of the Scriptures—in the performance of which it has been sadly deficient towards the inhabitants of the sister isle. There are 3,000,000 of Irish, who speak the Irish language only; and during the whole of the last century, not a single edition of the Irish Scriptures was printed for them. For one hundred and twenty-five years this total neglect of the indigenous population was committed by the English Establishment, which, during that period, must have drawn at least £125,000,000 of sterling money from Ireland, for its luxurious support. For eighty-three years preceding that, only 1,750 copies were printed, only 500 of which were Old Testaments, and the rest New Testaments. The whole period is two hundred and eight years, during which only 1,250 New Testaments, and 500 Bibles were distributed to the native Irish in their own tongue; and during this period, without doubt, the Church received £200,000,000 of involuntary tribute for its maintenance. Moreover, out of these 1,250 Testaments, and 500 Bibles, only about 800 of the former, and 300 of the latter, were distributed in Ireland, the rest being sent by Mr. Boyle to the Highlands of Scotland. During the above-mentioned period, upwards of 120,000 copies of the Scriptures, of which 102,000 were entire, were distributed, or sold at a cheap rate, among the Welsh, who number only about 600,000 persons, the aboriginal Irish being five times that number. Since the year 1811, to 1829, 297,458 copies of the Scriptures have been distributed among the Welsh, and 80,188 among the Irish. So that, notwithstanding all that Bible Associations have done for heathen lands; notwithstanding the prayers of the faithful, and the zealous co-operation of all sects and parties of Protestants, to destroy the works of the Devil and the Beast, not one hundred thousand copies of the Scriptures had in 1829 been distributed among the indigenous Irish population. This is merely a simple fact. We can find no apology, but negligence and indifference to that home where true charity begins. The agents of Bible Societies are forcing their way into China, in defiance of the Imperial edicts, and depositing Bibles, Testaments, and tracts, in the hands of the Chinese. They are even establishing printing presses on the water, to evade the interdicts of the sovereign authority, and smuggle in the word, in opposition to the political prohibition. Yet here, in our own United Kingdom, are three millions of native Irish, who, for two hundred years, have not received one hundred thousand copies of the Bible from a Church which they have actually been supporting by their own industry! It is needless to say, that the priests will not permit the Bible to be used. The priests are less formidable rivals than the Emperor of China; and moreover, the priests have no objection to the circulation of the Catholic Bible, with the notes of their own Church. But the pious Protestants will rather suffer the people to perish for lack of knowledge, than distribute a Bible which is translated by a Catholic!

Tantaene animis cœlestibus iræ?

Can such passions dwell in heavenly minds?

INCREASE OF CATHOLICISM IN AMERICA.

(From Miss Martineau's Society in America.)

I was seriously told by several persons in the South and West, that the Catholics of America were employed by the Pope, in league with the Emperor of Austria, and the Irish to explode the Union. The vast and rapid spread of the Catholic faith in the United States has excited observation which grew into this rumour. I believe the truth to be that, in consequence of the Pope's wish to keep the Catholics of America a colonial church, and the Catholics of the country thinking themselves now sufficiently numerous to be an American Catholic Church, a great stimulus has been given to proselytism. This has awakened fear and persecution, which last has again been favourable to the increase of the sect. While the Presbyterians preach a harsh ascetic, *persecuting religion*, the Catholics dispense a mild and indulgent one, and the prodigious increase of their numbers is a necessary consequence. It is found so impossible to supply the demand for Priests, that the term of education has been shortened by two years. Those observers who have made themselves familiar with the modes in which institutions, even of the most definite character, adapt themselves to the wants of the times, will not be made uneasy by the spread of a religion so *flexible* in its forms as the Catholic, among a people so intelligent as the Americans. The Catholic body is *democratic* in its politics, and made up from the more independent kind of occupations. The Catholic religion is modified by the spirit of the times in America, and its professors are not a set of men who can be priest-ridden to any fatal extent. If they are let alone, and treated on genuine republican principles, they may show us how the true, in any old form of religion, may be separated from the false; till the eye being made clear, the whole body will be full of light. If they cannot do this, their form of religion will decay or at least remain harmless, for it is assuredly too late now for the return of the dark ages.

TO CORRESPONDENTS.

A Commercial Traveller has been received, but he is perfectly unintelligible, and somewhat crazy; he talks of the uselessness of argumentative and speculative reasoning on theological subjects, although his own dialogue contains some of the most speculative reasoning on necessity and free agency which is to be found in our columns! And what is all this old song about individual regeneration and passive activity, and active passivity, but speculative reasoning? Instead of answering our questions, or trying even to answer them, he merely says, "When the Shepherd perceives the necessity of a constitutional change in his degenerated nature, he will understand the necessity of resignation to the Divine Generator." Now we never denied the necessity of resignation; we asked the meaning of "resigning ourselves up to the Divine Generator." This is the active sense of "resigning," and we are to do it without self-activity! We believe it utterly impossible for the Commercial Traveller to explain himself; and if he replies, that "being himself regenerated, we cannot understand him till we be as he is," then there is an end of the matter. But is he better than we, either individually or socially? Can he conscientiously and piously say, "stand back, I am holier than thou?" It is our firm opinion that the self-conceit which usually takes the name of Regeneration is a curse to religion, and is the result of great ignorance of the legitimate motherhood of the Church. The Church only can bring forth the new offspring, and the Church must first be formed bodily, according to the beautiful mystical saying of a Prophet—"My mother Zion bare me, and I brought her forth;" i. e., I brought forth the Church bodily, the Church then recreated me spiritually. This is regeneration, not an individual, but a great social, birth, "a nation born at once." (Is. lxvi. 8.)

Mr. Owen's lectures in our next.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

THE CONFESSIONAL.

"Come, now, let us reason together, saith the Lord; though your sins be as scarlet, they shall be white as snow; though they be red like crimson, they shall be as wool."—*Isaiah i. 18.*

"Confess your faults one to another."—*James.*

WHAT does the reader expect from the title of this chapter? a treatise on the practice of confession, as enjoined by the Catholic Church, and a curious and inquisitive review of the secret and indelicate manœuvres of the Roman priesthood, to unveil the arcana of domestic and connubial life, by too close an examination of the female sex? No: we refer him to Dens and the Jesuits for that—to Sanchez, especially—where he will find every idea that he can possibly imagine, and perhaps a thousand more, that are perfectly original, even to his teeming mind. We suffer such things to pass unnoticed. Quite enough is written and spoken respecting them in other quarters; and as we consider them only a specific form of the generic system of irreligion which prevails throughout the world, we do not think that any important object would be gained by their suppression—firmly believing that the practices complained of, with some few trifling exceptions, are as compatible with virtue, modesty, and pure moral feeling, as the so much vaunted delicacy of Protestantism, which is notorious over Christendom for the amount of sexual immorality which it has occasioned, and the deep depravation of female character, for which it is responsible. Morality in England is distributed in the same proportion as wealth. The good may be very good, as the rich are very rich; but the bad, especially those of the delicate sex, are infamous amongst travellers, and the moral scourge and pestilence of society. Let Catholics and Protestants fight their own battles. The strife is now beginning to rage with violence. The Catholics are persecuting and banishing the Protestants abroad. They are even depriving them of the privileges of denizens;* and the Protestants are petitioning Parliament to retaliate by similar legislative measures; whilst the missionary zeal is kindling the flame of a religious war, which will yet convulse the whole population of Christendom. We shall look on quietly—stand still, and wait for God's salvation. Both parties will perish—that is, the spirit of both parties will perish, and each, like the two knights, when they fell on the opposite sides of the black and white statue, will confess that both sides were in error.

No, reader; we do not mean to abuse confession. It is a good thing, when used with prudence. "Confess your sins to one another" is a goodly precept, and so necessary a part of Catholic religion, that confession to God is not complete without it. No religious duty is complete, which does not make man a partner with God in its performance.

Well, then, reader, we want to make thee our confessor! to

make an acknowledgment of our sins unto thee, that in so doing we may humble ourselves before God and man, and learn henceforth to aim at a higher degree of excellence than any we have yet attained. We have been accused by many of many sins; and we have felt the accusations, and bitterly regretted the offence inflicted. We have sometimes felt so deeply, and seen the difficulties that beset us so insurmountable, as almost to resolve to abandon for ever the attempt to stir up the dormant spirit of universal faith and religion, that belongs to every man, and which is only prevented from shining forth into social being, by the mists of sectarianism, which a conceited and ignorant philosophy has gathered around it.

These complaints are curiously contrasted; the same article, the same expression, that gives pleasure to one, gives pain to another; and it is no easy matter for the most stable mind firmly to withstand the powerful, the intelligent, the virtuous, and well-directed battery, either of praise or blame, from any point of the compass. The most powerful vessel will give way to a broadside, and we do not pretend to immovability. All that we can say is this, "We have never struck our colours;" we have preserved our honour.

But we have often fretted, often felt annoyed, often suffered the peculiar vexations of our position to disturb the tranquillity of our minds, and in the commotion of a tide of conflicting sensations, arising from the discrepancies of surrounding relationships, we have addressed the reader, and conveyed to our language the disturbance of the equilibrium of our own thoughts, and the imperfections, which a few hours or days of reflection would have quietly removed. For this we do not crave forgiveness. Evil should never be forgiven. To forgive it is to league with it. It is the perfection of the Divine Nature by no means to clear the guilty. Pursue evil to the last; but when you punish the evil, take care and punish *nothing else*.

We have not only used hard words and unkind, on several occasions, but we have also expressed ourselves in language which has not conveyed to the reader's mind the precise idea which we intended. The first is a moral, the second is an intellectual imperfection. Perhaps this confession may help us to get rid of them. But we do not mean to take all the blame to ourselves, for that would be unjust. We mean to share it with others. There is a moral duty for a reader, as well as a writer. Every reader's conscience should be able to tell him whether he performs that duty or not, by the social feeling which he experiences towards the writer. The understanding of a writer's meaning much depends upon the feeling of the reader towards the writer. Prepossession of either kind, friendly or adverse, is prejudicial to right interpretation. Let every reader judge for himself. We do not accuse persons; we accuse and persecute principles only. Intellectual imperfection will also produce the same effect in a reader's understanding as it does in the writer's language. Moreover, there is a native imperfection in language itself. Almost all abstract terms and epithets are used, by different people, in different senses, so that we find it impossible, in abstract discussions, to comprehend the meanings of men and women with whose modes of speech we are quite familiar, but whose language cannot convey to our minds the idea which it describes in theirs. It is not "*The Times*" alone

* Alluding to a letter in the *Times*, on Thursday, 28th, from Turin, stating that Protestants were to be deprived of the privilege of giving evidence as witnesses, or of having deeds drawn or grants made in their favour.

which longs for a reform of the English language, neither is it "*The Times*" alone which considers it one of the most urgent species of reform. There are few men who ever rose above the vulgar level of materialism in controversy with their fellow men, who have not experienced the same desire.

We observed, in a former number, that we were accused of teaching Atheism under the guise of Catholicity. The following is the passage complained of:—No. 11.

"Now, the mere spiritualists maintain that this '*being together*,' refers to *God and the soul*. This is the selfish aspect of religion, and is allied to that commandment of Christ, '*Love the Lord thy God with all thy heart*.' But there is another aspect, of a social and practical nature, which belongs to the department of works, and which is allied to the new commandment of Christ, '*Love one another*.' This latter is the end and purpose of religion. True religion begets this. False religion cannot beget it. Is, then, your religion true or false? try it by this test.—*Is your love of God, or union with God, or relationship to God, true or false, intimate or remote? try it by this test.*"

The "*selfish aspect*" of religion applied to the love of God gave offence. Had we written it "*individual aspect*," it probably would have passed. In the above passage, however, we were supposing the two aspects of religion to be distinct for the sake of argument. St. John does the same, when he says, "*he who says he loveth God, and loveth not his brother, is a liar, and the truth is not in him; for if he love not his brother, whom he hath seen, how can he love God whom he hath not seen?*" Love of God and social love are thus identified; but it is evident, from the very circumstance of John using this language, that there were people then, as there are now, who *professed* to love God while they loved not their brethren. They deceived themselves. Their love of God was *self-love*, as all love must practically be which is not socially developed. When, therefore, we said the mere love of God was the selfish aspect of religion, we did not mean to affirm that the love of God, without social love, was possible; but that to speak of it, or profess it, without the social development, was to view religion in a selfish aspect; and we think it requires only the eye to open and observe the hollowness and unfruitfulness of all professional religion, which dwells to a sickening extent upon this love of God, whilst it riots in the pampering of the selfish principle, to be convinced of the necessity of thus treating, like St. John, the unsocial profession of love to God, so common in society, as a selfish or false principle. However, we did not express ourselves sufficiently clear, and thus far we confess our *intellectual* error; whilst, at the same time, like Job, we boldly maintain our *moral* integrity. The concluding sentence of the extract, which we have marked in italics, reveals our meaning.

There are many other trifling matters which we might specifically enumerate. As, for instance, we have been, from two opposite quarters, accused of Radicalism and Toryism, of infidelity and superstition. Some say the *Shepherd* has too much faith, and others cannot bear such an infidel production. The reason of all this contrariety is very obvious. It is the necessary result of our position between the two polar extremes of thought. It is to ourselves a demonstration that we are really somewhere about the latitude which we calculated upon, and to which we essayed to steer. We do certainly allow that we partake of both poles, and not being able to explain our meaning or point out our intermediate position in every number, it is almost unavoidable that the rapid survey of an occasional reader, who does not carefully compare what is affirmed in one page, and illustrated in another, should form an erroneous opinion of many vague expressions, which it would be exceedingly awkward for us to illustrate, explain, or smooth down, every time we employed them.

But why, it is answered, give offence at all? Why not speak and write inoffensively? This is a most important question, peculiarly so to the present age. We know some people who write inoffensively—very clever people, far in advance of the age in which they live. But they are not understood. The eye of the clergyman or his flock glances dozingly over the article; it is all right, nothing to shake the old faith; a new

mode, perhaps, of drawing and painting a subject, but all compatible with the old doctrine, and sanctioned by the party which supports it. The old root is not struck, it is not even visibly aimed at. And as trees of every description, whether human or vegetable, can well afford a few branches and leaves, and even occasionally a bushel of fruit, provided you let the root and the stock alone, or refrain from engrafting a superior plant; so the Church and State will tolerate much variety of speculation within their precincts, provided only you profess to be friendly to their material constitution, and suffer them to enjoy that peace which they value above all other peace—letting them constitutionally alone. You cannot effectively attack a constitutional evil without giving offence, because until you give offence you are not understood. The offence is in your meaning, and takes effect whenever it is perceived. Hence all Reformers are necessarily offensive, and every attempt to reform inoffensively has proved a failure. What is the reason that the Church cannot reform itself? Because it is impossible to speak intelligibly in the Church on such a subject without shocking the feelings of its members. The spirit of Reform, therefore, goes out and attacks the institution objectively as an enemy, being necessarily prevented from doing it subjectively as a friend. The most powerful action upon both Church and State, for Reform, is offensive action; we wish, for our own comfort, that it were not so, but it is better to give offence to the abettors of evil than suffer the evil to reign unmolested.

"But there are degrees of offence? Cannot one act offensively in moderation? There is no occasion for wounding deeply." Well, we allow that a certain prudent medium ought to be preserved, and moreover, we are perfectly willing once more to confess our sins, and admit that we have not yet attained to this prudent medium; and we believe it would take the prudence of an Archangel himself to abide in it. It is an exceedingly difficult task to convey new ideas to the mind. We believe there are numerous public writers in London at present, who cannot by language convey the thoughts to which they attach the greatest importance. If they do not go far enough they are not understood; if they go too far beyond the line of prudence, the public are offended. Fearing to offend, they labour for life, pregnant with an idea and cannot get delivered.

"It must needs be" said Christ, "that offences come, but woe unto that man by whom they come." He himself brought an offence into the world, and it was wo! wo! unto him; his Apostles carried the same burden of the Lord, and their punishment was similar. We can have no conception, in this age, of the offence of the Gospel when it first appeared. Blasphemy, to deify a man; Atheism, to deny the gods; sacrilege and irreligion, to abandon sacrifices, which prevailed everywhere at the time. Every offence, in fine, which at present is loaded with the abuse and execration of professional religion, was then concentrated in the new religion. Was it wisdom in God to commence a new era thus? If so; it may now be absolutely necessary for man to follow his example.

We have often been accused of offensiveness in the manner in which we have taught the unity of the source of evil and good. Now we have made the experiment in private by teaching it both ways. In the inoffensive manner we find it easy, comparatively easy, to obtain an apparent assent to the general proposition; but whenever we make an application to try the understanding of the party, we find that the assent was merely formal, and that the mind had only superficially surveyed the language without embracing the meaning. For example, it is easy to make people confess that God is the creator of all things, that all power is from God, that by him all things consist, that his life is our life, that he is the all, and in all, &c.; all general propositions, expressive of unity in universal being, and very beautiful and inoffensive—but not understood; for the very same individuals who acknowledge in one breath that all things are created by God, will tell you in another that evil was not created by God, and thus divorce one half of Nature from the Deity. They will tell you that evil grows in nature as worms grow in wood; they will disant on the self creative property of a free agent; and turn round upon you at last, and give a flat denial to the proposition, to which they first subscribed. Show us the man who has learnt that doctrine

inoffensively, and we will convince you that he does not believe, does not understand it.

We have often asserted that injustice is a property of justice. We are not understood. But we challenge any man to define justice without including injustice at its negative pole, not as a thing distinct or separate from justice, but really as a living part of it. We would illustrate the principle of eternal justice thus

JUSTICE ABSOLUTE,
(Including Injustice relative.)

P. Equality, Impartiality, &c. ————— Inequality, Partiality, &c. N.

The line represents the principle of justice. Equality is the positive pole of justice, inequality is its negative. Were God to make all beings equal in power, beauty, virtue, &c., he would deform creation, by destroying its interesting variety. His wisdom, therefore has made all beings unequal, in power, beauty, virtue, &c. But perfect wisdom and perfect justice are in perfect harmony. This inequality therefore is justice. But yet, who can or will deny that inequality of favour and distribution, is the very essence of injustice? How can you logically define this rod of justice without including injustice as a subordinate feature? Do you say that this is a contradiction in terms? Say so, if you please, but imagine it otherwise. All Nature is a contradiction in terms, and all true philosophy is like that line; a bipolar proposition containing *two opposites which are not contraries*. Electrical science has now demonstrated this fact, in physics. Imagine that line an electric rod; you have two opposite electricities in it, which are not contraries, but inseparable companions—yet one. This line is capable of demonstrating all the doctrines taught in the *Shepherd*. The offence which we commit is included in that small type of *injustice relative*; but the universal doctrine we teach is *JUSTICE ABSOLUTE*. This at least is what we mean. The doctrine is simple and certain in our own minds; but forgetting frequently that we are read by those who are in a different state of being from ourselves, we frequently use expressions for which better might be substituted, and pass over without illustration, that which requires a very careful exposition. But, offence we must give to a certain extent, or remain misunderstood. And one mode of giving offence would probably be, calling that upper line of *JUSTICE ABSOLUTE*, God, and the other line of *relative Injustice*, Satan. This, however, is what we mean, and the mind which cannot hear this, cannot analyse Nature, and is yet in the bonds of fear.

Now what has this confession amounted to? "That we have sinned," and that our readers ought in conscience, also to confess, "that they have sinned." We do not profess to flatter the present state of any man or woman's moral or intellectual being. To write without offence would be positively useless; to exceed in offence would be positively injurious. To cultivate the good and offend the evil in moral and intellectual being, is our object and our wish; when we fail it is from want of moral and intellectual perfection to guide ourselves. But these we positively affirm as the pillars of our faith—first, the eternal and immutable absolute Deity; second, his *methodic* providence in the relative mutability, and succession of time, and ALL its productions. This latter proposition is the basis of our Christian faith, Christianity being the greatest work of Providence in the history of man; and Christ being the greatest moral authority who ever lived in time, and therefore the incarnate image of the eternal God.

SIX LECTURES BY MR. OWEN,

WITH AN ADDRESS TO CONGRESS, &c.

Heywood, Manchester, 1837. 2s.

We take a deep interest in all that Mr. Owen does, and although there be some important points of difference between us, we regard him as the leader of the social movement in Britain. He is shaming the Christians. They are a disgrace to their Master; they may say they have prophesied in Christ's name, and in Christ's name cast out devils, and in Christ's

name done many wonderful works; but he must say to all, "depart from me, I know ye not, ye workers of iniquity. Other sheep I have which are not of your fold." Mr. Owen works upon the social basis, and thus far we are decidedly at one with him. We have formerly defined the principles which separate us, to which we are not at present disposed to revert. We heartily wish him success in his attempt, believing that the imperfection which must necessarily attend every incipient undertaking, would gradually vanish before experience, and that the great one truth to which we attach what the Owenites call a foolish importance, would force itself more obviously and irresistibly upon the mind, after a practical effort to dispense with it entirely. Who can object to the social principle of Owenism, and call himself a Christian? He is a very foolish and an ignorant Christian, a Christian who is leagued with antichrist, and striving with all his individual influence, to prevent the practical realization of the gospel, as good news to the children of men.

These lectures were delivered in Manchester previous to the late discussion between Mr. Owen and the Rev. Mr. Roebuck, the Warrentite Methodist. They are fresh from the fountain, and the latest production of this British Apostle of "*Social Justice*," whose name is connected throughout all Christendom with this one idea. There is a large stream of pure moral and original truth running through them; the evils of the old world, and the anticipated harmony of the new, are painted with as much clearness and vigour as ever, affording the comfortable assurance that Mr. Owen's mind still retains its wonted strength, and its former enthusiasm, both of which may God preserve till he has inflicted such a deep wound on the unsocial system of Satan's domination, that the monster will writhe with the torture, till it breathe its last amid the hallelujahs of the rich, and the exultations of the poor.

We have picked out the following passage as one amongst many others equally interesting, and equally characteristic of the author's mind:—

It is, however, somewhat difficult, previously to additional experience, to decide very accurately what should be the precise permanent divisions of human life to form the best classification. But there is now, sufficient knowledge for present purposes, and experience will afford more, so soon as it shall be required.

Probably, periods of five years, up to thirty, will afford a present useful classification, and each class to be occupied as follows:

First class or from birth to the end of the fifth year.

To be so placed, trained, and educated, as that they may be in a proper temperature for their age, fed with the most wholesome food; lightly and loosely clothed; regularly and duly exercised in a pure atmosphere; also, that their dispositions may be formed to have their greatest pleasure in attending to, and promoting the happiness of all who may be around them; that they may acquire an accurate knowledge, as far as their young capacities will easily admit, of the objects which they can see and handle, and that no false impression be made on any of their senses by those around them refusing a simple explanation to any of their questions; that they may have no knowledge of individual punishment or reward, or be discouraged from always freely expressing their thoughts and feelings; that they may be taught as early as their minds can receive it, that the thoughts and feelings of others, are, like their own, instincts of human nature which they are compelled to have, and thus, to acquire in infancy the rudiments of charity and affection for all; that they may have no fear of, but full and implicit confidence in, every one around them, and that the universal, selfish, or individual feeling, of our animal existence, may be so directed as to derive its chief gratification from contributing to the pleasure and happiness of others.

By these measures a solid foundation will be laid for sound minds, good habits, superior natural manners, fine dispositions, and some useful knowledge. By these means they will be so well prepared before they leave this class, that, for their age, they will think, speak, and act rationally. They will be, therefore, at the end of this period, in many respects, in advance of

the average of human beings, as they are now taught and placed, at any time of their lives.

It is true, that at this age, they will not be equal to the men of the old world in physical strength, or in the number of sensations which they have experienced, or impressions received; they will, however, for their age, have more sound health, and be more active; they will have superior dispositions, habits, manners, and morals; they will have fewer notions and fancies, but they will have a greater number of true ideas. These true ideas being of course all consistent with each other, and in accordance with every known fact, will be of far more advantage to the individuals, than the matured minds of the old world, in the majority of which, there are but few true ideas, with many false notions. These false notions destroy the value of the few true ideas which they have acquired; for the true ideas, thus mixed with error, tend only the more to perplex their reasoning faculties, and to confound their judgments.

The first class being prepared by this new rational nursing and infant training, will leave the nursing and infant school to be removed into the appropriate arrangements for the second class; which class will consist of children from five to ten years complete.

This class will be lodged, fed, and clothed, upon the same general principles as the first class, making only the difference which their age requires; but, now, their exercises will consist in that which will be permanently useful. According to their strength and capacities they will acquire a practice in some of the lighter operations of the business of life; operations, which may be easily made to afford them far more pleasure and gratification than can be derived from the useless toys of the old world. Their knowledge will be now chiefly acquired from personal inspection of objects, and familiar conversation with those more experienced than themselves. By this plan, being judiciously pursued, under rational arrangements properly adapted for the purpose, these children will, in two years become willing, intelligent assistants in the domestic arrangements and gardens for some hours in the day, according to their strength. Continuing this mode of education, these children from seven to ten will become efficient operators in whatever their physical strength will enable them easily to accomplish, and whatever they do, they will perform as a matter of amusement, and for exercise, with their equally intelligent and delightful companions. These exercises they will pursue under the immediate directions of the juniors of the third class; for, it is anticipated, that the young persons, twelve years of age and under, will, with the greatest pleasure and advantage to themselves and society, when thus rationally trained and placed, perform all the domestic operations of their own immediate association or family; and perform them in a manner far superior to what is now in execution in the most approved clubs in London and Paris; they will also assist to keep the gardens and pleasure grounds of the family in the highest order, for the rational enjoyment of themselves, their own immediate association, and also of those numerous superior friends who will visit them from other similar family establishments.

When these children shall be advanced to the age for leaving the second class, they will have their character so formed *physically, intellectually, morally, and practically*, that they can no longer be compared with any of the irrational characters which have been formed under the old system of man's free-agency. At ten, they will be well-trained, rational beings; superior in mind, manner, dispositions, feelings, and conduct, to any who have yet lived, and their deficiency in physical strength will be amply supplied, by the superior mechanical and chemical powers, which will be contrived and arranged, to be ready for them to direct when they enter the next class. These new operations will be, to them, a continual source of instruction and amusement, and to which they will look forward with the delight experienced by the acquisition of new and important attainments.

The members of the second class, when they shall complete their tenth year, will enter the third class, which will consist of those from ten to fifteen years complete. This class will be engaged, the first two years, that is, from ten to twelve,

in directing and assisting those in the second class from seven to ten, in their domestic exercise in the house, gardens, and pleasure grounds; and from twelve to fifteen, they will be engaged in acquiring a knowledge of the principles and practice of the more advanced useful arts of life; a knowledge by which they will be enabled to assist in producing the greatest amount of the most valuable wealth, in the shortest time, with the most pleasure to themselves and advantage to society. This will include all the productions required from the soil; from mines; from fisheries; the arts of manufacturing food, to keep and to prepare it in the best manner for daily use; the art of working up the materials to prepare them for garments, buildings, furniture, machinery, instruments, and implements for all purposes, and to produce, prepare and execute, whatever society requires, in the best manner that the concentrated wisdom and capital of society can direct. In all these operations the members of this class, from twelve to fifteen years, will daily assist, for as many hours as will not injure their physical strength, mental powers, or moral feelings, and with their previous training, with the daily superior instruction and aid which they will receive from the members of the class immediately above them; they will perform all that will be necessary for them to do, with no more exercise than their physical and mental health will require to keep them in the best state of body and mind. In these five years, also, they will make a great advance in the knowledge of all the sciences; for they will be surrounded with every facility to acquire accurately the most valuable knowledge in the shortest time; facilities such as will open *more* than a "royal road" to the acquisition of knowledge attainable by man with the aid of all the facts yet discovered. This will be a period of great progress and consequent interest to this new race, thus trained, to become, for the first time in human history, intelligent rational beings.

They will now be well prepared to enter the fourth class, which will be formed of those from fifteen to twenty years complete. This class will enter upon a most interesting period of human life; within its duration, its members will become men and women of a new race, physically, intellectually, and morally; beings far superior to any yet known to have lived upon the earth—their thoughts and feelings will have been formed in public, without secrecy of any kind; for as they passed through the previous divisions, they would naturally make known to each other, in all simplicity, their undisguised thoughts and feelings. By this rational conduct, the precise feelings which they were obliged to entertain for each other, would be accurately known to all. Thus would it be ascertained who had the strongest attachment for each other, and these will naturally unite and associate together, under such wise and well prepared arrangements, as shall be the best devised, to insure to the individuals uniting, the greatest amount of permanent happiness with the least alloy to themselves, and injury to society.

Under this classification and consequent arrangement of society, every individual will be trained and educated, to have all his faculties and powers cultivated in the most superior manner known; cultivated, too, under the new combination of external objects, purposely formed, to bring into constant exercise the best and most lovely qualities only of human nature. Each one will be, thus, well educated, physically intellectually, and morally. Under this classification and consequent arrangement of these associated families, wealth unrestrained in its production by any of the artificial absurdities now so common in all countries, will be most easily produced in superfluity; all will be secured in a full supply of the best of it, for all purposes that may be required. They will, therefore, all be equal in their education and condition, and no artificial distinction, or any distinction but that of age, will be known among them.

There will be then no motive or inducement for any parties to unite, except from pure affection arising from the most unreserved knowledge of each others' character, in all respects, as far as it can be known before the union takes place. There will be no artificial obstacles in the way of the permanent happy union of the sexes; for, under the arrangements of this new

state of human existence, the affections will receive every aid which can be devised to induce them to be permanent; and under these arrangements, there can be no doubt, that, as the parties will be placed as far as possible in the condition of lovers during their lives, the affections will be far more durable, and induce far more pleasure and enjoyment to the parties, and far less injury to society, than has ever yet been experienced, under any of the varied arrangements which have emanated from the imagined free-will agency of the human race.

If, however, these superior arrangements to produce happiness between the sexes, should fail in some partial instances, which it is possible may yet occur, measures will be introduced by which, without any severance of friendship between the parties, a separation may be made, the least injurious to them and the most beneficial to the interests of society.

No immorality can exceed that which is sure to arise from society compelling individuals to live continually together, when they have been made, by the laws of their nature, to lose their affections for each other, and to entertain them for another object. How much dreadful misery has been inflicted upon the human race, through all past ages, from this single error? How much demoralization! How many murders! How much secret unspeakable suffering, especially, to the female sex! How many evils are experienced over the world, at this moment, arising from this single error of the imaginary free-will system by which men have been so long, so ignorantly, and miserably governed!

This portion of the subject, to do it full justice, would, alone, require a longer course than is now given to the development of the whole system under consideration; but this limited view must suffice, at present, for a sketch or outline of what is in contemplation.

This fourth class will be still more active and general producers of the various kinds of wealth required by society, as well as the kind and intelligent instructors of the senior members of the third class to enable these senior members to acquire the knowledge which has been previously taught to themselves, when members of the third class. It is not improbable, that those four classes, under such simplified arrangements in all the departments of life, as may now be made, will be sufficient to produce a surplus of all the wealth, which a rational and superior race of beings can require; but to remove all doubt respecting this part of the subject, and to make the business of life a pleasure to all, another class of producers of wealth, and instructors in knowledge, shall be added, and they will form the fifth class; which class will consist of those from twenty to twenty-five years complete.

This will form the highest and most experienced class of producers and instructors, and beyond the age of this class, none need be required to produce or instruct, except for their own pleasure and gratification. This fifth class will be the superiors and directors in each branch of production and of education. They will perform, in a very superior manner, that which is now most defectively done by the principal proprietors and active directing partners of large producing establishments, and by the Professors of Universities.

The great business of human life is, first, to produce abundance of the most valuable wealth for the use and enjoyment of all; and secondly, to educate all to well use and properly enjoy their wealth after it has been introduced.

We have now most amply provided for the production of the wealth, and also for the formation of a superior character to use and enjoy it in the most advantageous and rational manner, by the five classes of producers and instructors which have been described.

The sixth class will consist of those from twenty-five to thirty years of age complete.

The business of this will be to preserve the wealth produced by the previous classes, in order that no waste may arise, that all kinds of it may be kept in the best condition, and used, when in the most perfect state, for the beneficial enjoyment of all parties. They will also have to direct the distribution of it, as it may be required from the stores, for the daily use of the family. Under the arrangements which may be, and no doubt will be formed for these purposes, two hours each day will be

more than sufficient to execute the regular business of this class, in a very superior manner. Some part of the remainder of the day they will most likely feel the greatest pleasure in occupying with visits to various parts of their beautiful and interesting establishment, to see how every process is advancing, with each of which, by their previous training they will be familiar, and now, at their leisure, they may consider whether any improvement can be made in them for the general benefit. Another portion of the day they will probably devote to their most favourite studies, whether in the fine arts, in the sciences, in trying experiments, in reading, or conversation, or in making excursions to the neighbouring establishments, to give or receive information, or to make visits of friendship.

This would be the prime period for the more active enjoyments of life, and all would be, by this classification, most amply enabled to enjoy them. They would have high health, physical and mental; they would have a constant flow of good spirits; they would by this period, have secured a greater breadth and depth of the most varied useful knowledge in principle and practice, than any human beings have ever yet attained: they would also be familiar with those acquirements which, in addition to their attainments in that which is useful in principle and practice, would render them delightful companions to each other, and to all with whom they may come in communication. And they would be thus preparing themselves to become fit members of the class immediately in advance of them, that is, the seventh class. This will consist of all the members of the family, from thirty to forty years inclusive.

(To be concluded in a future Number.)

FOURIER'S SOCIAL SYSTEM.

According to promise we proceed now to give the reader an outline of the social "Phalange" of Charles Fourier, a system of society intercourse which has not been able to raise its voice so loud, as that of the Saint Simonian doctrine; but one which the more we study its beautiful details, impresses us with a deeper conviction of its superiority to its rival, in working with all the variegated passions and affections of human nature; and bringing all its now jarring sounds of discord, to join in a chorus of universal harmony. The two systems above alluded to, have engaged the attention of many superior minds in "La belle France." In this respect, we believe, there is a very notable distinction between France and England. The social system in England has never, up to this very hour, been patronized or encouraged, by men of education and learning. In France the very highest order of nobility and talent do not hesitate to avow themselves friendly. Probably the repression of public opinion by the severity of government has a tendency to create this social prepossession in private. The remark has been frequently made that the principles of genuine liberty have been vulgarized in Britain, by the unlimited scope which is given to the expression of opinion, both by the tongue and the pen. This evil will ultimately cure itself with us, but, in the meantime, we have to overcome the obstacles, with which it has impeded our progress, and the difficulties which we experience in so doing, will give the people some lessons in true philosophy, which it is indispensable for them to learn before they can be happy. Moreover, there is this singular difference, between the two most remarkable French systems, and the one, the only one which has been promulgated in England, that the two former are founded upon a basis of religious faith. This is remarkable in a country like France, notorious for infidelity; but we are pretty well convinced that it is partly owing to this latter circumstance, that so much feeling and talent has collected around them. Infidelity is less offensive in France, than in England; and such views of God and the destiny of man as are presented in the doctrines of St. Simon and Fourier can even be contemplated without horror, by a professor of religion; we say professor, for the truly religious mind is that in which the law of universal harmony reigns, and which does not confound the outward forms and creeds of a church, with the inward life of Divine and social faith.

Not having confidence in our own ability to analyse the system of Fourier; indeed, not being provided with a copy of

his works, which we cannot procure in London, and which are not to be found in the catalogue of the British Museum, we intended to write to Paris for an outline which Mr. Doherty, one of the four members of Fourier's "la Commission Préparatoire," promised us a year ago; but to prevent delay, and perhaps disappointment, as we are informed Mr. Doherty is about to come to England, for the express purpose of giving publicity to the doctrine he has embraced, we have resolved to make a literal translation of Abel Transon's "Theorie Sociétaire," published in the *Revue Encyclopédique*, under the sanction of Fourier himself, as a compend of his doctrine and mechanical arrangements.*

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon late Pupil of the Polytechnic School, and Engineer of Mines.

"We ought to be prepared for some great event in the order of the general destiny, the French revolution being nothing more than the terrible and indispensable preliminary of the memorable revolution which is approaching." (De Maistre). This idea, which the illustrious defender of Catholicism has presented in many forms, and which bloomed in all the great spirits of his age, has at length become almost vulgar. Every one now feels that in the crisis where things now stand, there must be a prompt and satisfactory solution of the questions, which the spirit of inquiry has started in politics, religion, and morals. Every man invokes, with all his prayers, a new and efficacious remedy for the general misery.

We have studied modern societies, and perceived that they do not deserve the name of societies, since the progress of intelligence and of public riches, is profitable only to the fortunate few, as in England, where the misery of the people increases in proportion to the development of industry. We have interrogated history, and have discovered, that at no one epoch, in no one place, has man ever enjoyed a perfect liberty. And, those who in this word, "*man*," give a large space for the people, the people who labour; those have learned by experience, that, in order to give liberty to man, it is not enough to modify, or even to subvert any existing form of government.

In the mean time some new ideas have taken root, new facts have been presented. German philosophy has expatiated upon "universal unity." In England they have attempted the institution of co-operative societies; and France has resounded with a word, which is at once a pleasing hope (*belle esperance*) and a great problem:—*Association*.

I am about to give an account of the labours of a man, who, in 1808, wrote these remarkable words:—"It is in vain, philosophers, that you have accumulated libraries in search of happiness, so long as you have not extirpated the root of all social evils, viz. the *industrial incoherence*, which is the antipode of God's design. Is it in disdain, or inadvertence, or fear of failure, that men of learning have neglected to exercise their intellects upon the problem of Association? It matters not what has been their motive, they have neglected it;—and I am the first and the only one who has studied it. If, therefore, the theory of Association, unknown till now, could lead the way to other discoveries, if it be the key of new sciences, they ought to have fallen to me only, since I am the only one who has sought and apprehended this theory."—(*Theorie des Quatre Mouvements*, Discours Préliminaire.)

In the same work (1808), M. Charles Fourier gave a most vigorous critique of Society, and placed the principles of Association, which he had reproduced, in a methodical train, and, with the fullest developments, in 1822, (*Traité de l'Association Domestique-Agricole*), after fourteen years of silence and meditation. Ten years have passed since this publication. In the interval, the same ideas have been presented under an

abridged form (*Le Nouveau Monde Industriel*, 1829). These different works contain the exposition of a discovery of the Social System,* the results of which, if put to the test, are of the highest importance, and affect the dearest interest of humanity. The practical verification is easy, and yet the labours of M. Fourier have passed almost unnoticed. His name remains in comparative obscurity. Is this, then, an oversight, which we must add to the numberless oversights of which society has been guilty towards men of genius? I will endeavour to put the reader in a condition to resolve this question for himself.

The principal work of Fourier is the *Treatise of the Domestic Agricultural Association*. It is, as he himself says, a "*Theory of Universal Unity*." M. Fourier has made choice of a very modest title, not to alarm the minds of those who are afraid of novelties. Moreover, he has endeavoured to draw the attention to the first thing which ought to be done, that is, to make a rapid increase of produce, in order to extirpate indigence, the general scourge, which falls upon the inferior classes. For this reason it is necessary, in the first place, to organize the most common and most productive employments—those of domestic economy, and housekeeping. If the theory of Association is found, this is the first application which ought to be made of it. For the rest, it is sufficient to know in what terms M. Fourier presents the problem of Domestic Agricultural Association, to be convinced that the solution can come only from a very general theory, and to perceive that the object of the book is much more vast than one would be tempted to believe from the simplicity of the title. The following is the manner in which he expresses himself:—

"I am about to discuss a question which will appear devoid of any relationship with destiny. It is Agricultural Association. I myself, when I began to speculate upon this object, never could have imagined that so simple a calculation could lead to a theory of social condition. The solution of this question, so much despised, led to the solution of all political problems. We know that it requires sometimes but very small means to accomplish very great ends. It is with a metallic needle that the thunder is controlled, and the vessel is conducted amid storms and darkness, and it is with means equally simple that a termination may be put to all social calamities."—*Theorie des Quatre Mouvements*, p. 10.

That which has opened to M. Fourier a path perfectly novel is, that in treating of Association, he has operated at once upon the passions and upon industry—endeavoured to conciliate individual and collective interests—above all, that he has proposed to create industrial attraction, and transform all labour into pleasure.—(*Sommaire*, p. 3.)

Before attempting the methodical exposition of the system of Fourier, I insist upon this capital idea of rendering labour attractive, so that every one is drawn to it *freely* and *by passion*. We shall see further on if this result is attained, but it is well from the commencement to suppose such a problem solved, and to foresee the consequences.

It is clear that the complete solution of this problem will dispel the principal difficulties of association. It would be the happiest result of a theory, and the best guarantee of its realization. This point gained, the results announced by M. Fourier, however marvellous they may appear, would have nothing chimerical. If the labours of industry are transformed into pleasures more captivating than our festivities (and those of the people are not so very brilliant but they may conceive the possibility of exceeding them), then the rapid increase of all productions, the accession to employment of all the rebellious classes, (the idle, the young, the vagabond, the savage), the abolition of transportation, the enfranchisement of negroes and slaves, with the full consent of their masters, all these promises of the author become simple and natural. I remark yet one more advantage which embraces all others, and which will convince the reader of the interest which the idea of M. Fourier involves. Industry being supposed attractive, the association could, without any risk, make an advance, to the poorest associate, of a minimum of lodging, food, and clothing. Thus the least for-

* The works of Fourier are "*Theorie des Quatre Mouvements et des Destinées Générales*," 1 vol., published 1808—" *Traité de l'Association Domestique-Agricole*," 2 vols. (1822)—"*Le Nouveau Monde Industriel et Sociétaire*," 1 vol. (1829).—Chez Bossange-père, Rue Richelieu, No. 60, or at the office of the Phalanstère, or Phalange, Rue Joquelet No. 5.

* *Le procédé Sociétaire*.—A literal translation of this expression would make barbarous English.

fortunate of men would enjoy this advantage, which Nature does not refuse to the brute creation, tranquillity of mind with respect to futurity. But so long as industry is repugnant, the workman will do nothing except when he is stimulated by indigence. We cannot, therefore, in the present state, guarantee to him, even this minimum, without which, however, all liberty is illusory.

I will endeavour to point out the means which M. Fourier employs to create *industrial attraction*, but I must first expand the general conception which binds together all the parts of his system.

IMPASSIONED ATTRACTION, OR THE DETERMINATION OF THE PLAN OF GOD.

"Impassioned attraction (*l'attraction passionnée*) is the impulse given by Nature anterior to reflection, and persisting, in spite of the opposition of reason, of duty, and of prejudice, &c." M. Fourier devotes a particular portion of the "*Treatise of Association*" to demonstrate the excellence of impassioned attraction, its property of *divine permanent interpretation*, the necessity of taking it for a guide in every social mechanism where we wish to follow the ways of God to arrive at the practice of justice, and truth, and social unity."

Present society is so constituted that one can hardly be allowed to satisfy his desires without doing injury to himself or his fellows. Every man desires riches, for example, but the greatest number is denied them. Labour, and the practice of truth, are seldom the ways of fortune. In almost every direction falsehood and fraud prevail. Does any one desire to procure the pleasures which civilization presents, it is an almost certain method of ruining his purse and his health. We cannot abandon one passion without sacrificing others. Love does wrong to friendship, and ambition causes us to forget both, &c. These observations are trivial; but, instead of considering, as heretofore, these miseries as inherent in human nature, M. Fourier calls all this a world turned upside down (*monde à rebours*). As he has faith in the INTEGRALITY OF PROVIDENCE, he lays down as a first principle that there exists a social mechanism appropriate to human nature, a mechanism which will make the interest of each man concur with the practice of truth, which will open to all a simple path to riches and happiness, and this path will be the obedience of each to the impulses which he receives from Nature, i. e., to *impassioned attraction*.

Attraction is the one and universal law of all movements; of the social as well as of the material movement. If at present man cannot obey this impassioned attraction without serious inconvenience, it is not because man is vicious, it is simply because the social order in which he lives is contrary to Nature. This truth appears so obvious to M. Fourier, that he is astonished that so long a period has elapsed without seeking a termination to the present system.

To place impassioned attraction as the first principle of the social movement is somewhat bold, for where will the desires of men cease? and when every weight which now prevents their excesses is at once removed, what will preserve all these passions in harmony? M. Fourier approaches very boldly these difficulties. He promises to lead the passions to equilibrium by the influence of pleasures, and not by moral discourses, the method hitherto adopted by all moralists, a method which, moreover, has never succeeded. As to the advocates of moderation, who pretend that perfection is not to be attained by man: "What do they know of it? Why despair of the wisdom of God before they have studied his designs in the calculation of the *social permanent revelation*, or *impassioned attraction*, of which one cannot determine the ultimate object but in proceeding regularly by analysis and synthesis? But this calculation seems absurd at first sight. It informs us that every one desires to possess millions and a palace. How can these be given to all the world? Frivolous objections! Is this a motive to abandon a study? Pursue it without fear. Follow the precepts of your philosophers, which enjoin you to explore the whole domain of science. Finish, therefore, that which Newton has commenced—the calculus of attraction; it will teach you that that which desires millions and a palace,

desires too little, for, in the social state (*l'état sociétaire*) the poorest of men will enjoy five hundred thousand palaces, where he will find *gratuitously* much more pleasure than a king of France can procure with thirty-five millions of revenue, &c."

I beg the reader to suspend his judgment upon such assertions until he has finished the perusal of this simple analysis. It suffices for the present to feel how far the principle of impassioned attraction, considered as the permanent interpreter of the divine will, is something profoundly religious, and how the discovery of a plan of association which would give free scope to attraction, would manifest in a high degree the infinite wisdom and bounty of Providence in leaving nothing of an arbitrary nature in the organization of societies. The legislator then will strive no longer to direct man by constraint. The moralist will appeal no more to the reason to restrain inclinations which are stronger than reason itself; and, in fine, the theocratist would have no more pretext for repressing the liberty of mankind. It is necessary to read in the work of M. Fourier his admirable critique of the laws of constraint, and the precepts of reason opposed to attraction. I confine myself to the transcription of the table in which he sums up all the properties of impassioned attraction, considered as the principle of the social movement.

(To be continued.)

THE TRANSCENDENTALIST'S DIALOGUES.

No. XII.

ON "FINITE BEINGS."—(Continued from p. 110.)

Transcendentalist—*Idealist*.

Ideal.—Still I am not convinced that there is any reality but ourselves. You say we are never independent of objects, or at least imaginations called from objects.

Trans.—I do; and I hope you are not going to appeal to a very deep sleep, when we do not dream at all. Because, if there be a state in which we have no perception, we can have no qualities at all; and as you say all physical objects, our own bodies included, are in themselves nonentities, there must be a general annihilation and suicide every time we take a sound nap, and when we wake there must be something to call us back into existence; and this something cannot be ourselves, since we, by the hypothesis, have already ceased to be.

Ideal.—You are quite right, and I do not believe we ever are in a state without any consciousness, though our memory does not always suffice to record different states of consciousness. But can we not look forward to a time when we shall be free from all restraint—when we shall not be bounded by any object—when we shall look back on our earthly state, and acknowledge, that though the curbs we formerly felt haunted us through that state, they were not necessary to our being, but have utterly passed away, while we remain free and unbounded.

Trans.—A very sublime picture! I beg your pardon—no picture at all, because you say there will be no objects to see. So you imagine there will be a time when we shall never direct our regards outwards, nor even to the images of external objects in our own minds, but remain merely contemplating our own infinite perfections.

Ideal.—That is what I mean. Then it will be proved that we ourselves are absolutely independent, and require not any thing external.

Trans.—Then, and I fear not before then, which will be a pretty long while. Now only observe what dogmatism is your doctrine! A Materialist talks of the existence of something altogether independent of spirit, and when you ask him to prove it, he says, I feel it, see it, touch it, &c. This alleged proof you call dogmatism.

Ideal.—And so it is.

Trans.—I agree with you, as you know. It is dogmatical. And why? Because the Materialist concludes, that since matter affects mind, it can exist without mind; from those very sensations which could not be were it not for himself, the percipient, he concludes there is something independent of all percipients whatever. This dogmatism consists in drawing a larger inference than his premises warrant.

Ideal.—Exactly so.

Trans.—And what do you do? You are aware of your own existence as a perceiving, thinking, willing being, and acknowledge by this that there are objects of your perception, thought, and will. Your own existence is manifested to you, by the contemplation of external objects, (for you must admit them to be external, though you make yourself their origin), and from this you dogmatically infer the existence of yourself without external objects. That is, your dogmatism is the same as that of a Materialist, namely, you infer more than your premises warrant.

Ideal.—I believe you are pretty right; one cannot *prove* one's independence of external objects; but may not one indulge a pleasing hope, that one may some day enjoy that independence?

Trans.—I think not. This independence seems to me a contradiction *in se*. Let us for a moment consider what, in common parlance, is called freedom and captivity. Suppose a man compelled to inhabit a dungeon for many years. He is a captive. What is his condition?

Ideal.—He is free, day after day, to behold the same walls—to—

Trans.—Stay, that is enough. I think we shall both agree that a man who is compelled for several years to see the same walls is a captive in the strictest sense of the word. But let us perform the pleasing office of opening the prison door, and turning the captive loose. Let him run over the fields. Is he a captive now?

Ideal.—No.

Trans.—But suppose we shut the gate of the fields, and keep him in all night, though he wishes to get out, is he a captive then?

Ideal.—Yes.

Trans.—And what was the difference between his freedom and captivity. It did not depend on place. A man in a prison, with the door open, would be a free man. And a man kept in the open air against his will would not be free.

Ideal.—True.

Trans.—This is the first definition. That man is free who can at will vary the objects placed before him, that man is captive who cannot vary those objects though he wills it, and they prove unpleasant. The free man sits in his house, and when the walls grow wearisome he walks out; that is, he exchanges these objects for the sky, fields, streets, &c. These again weary him, he walks back home, that is, he re-exchanges this out-of-door prospect for his walls. An ardent imagination may be a great cause of comparative freedom. Shut two men in a room, let one be so deficient in imagination that he cannot imagine any absent object whatever, the other have the power of calling up delightful images at pleasure. How different are the situations of these two men, the one bound to contemplate a disagreeable reality, while the other can, as it were, close his mind's eye upon the present gloomy prospect, and alleviate his wretchedness by wandering through regions of past or fictitious happiness. But observe neither one nor the other is freed from objects altogether, both are equally obliged to contemplate something. The reason why we call one man more free than the other, is that he can with greater facility vary his objects.

Ideal.—Methinks I have a new view of freedom. I now find that there may be a liberty attending the perception of external objects, while I before thought freedom could only arise from their removal.

Trans.—Let us for a moment suppose their removal. Let us suppose the objects of sight gone, that is to say, let us suppose blindness, let us suppose deafness, let us suppose taste gone, let us suppose the memory of previous objects extinguished, and what is there left? A being possessed alone of the sense of touch; that is, having the rank we assign to an oyster. In our progress to exalt man we have degraded him almost to a Zoophite. Take away this small residue, and what happens short of absolute annihilation. Not death, not mere death, for to me, who firmly believe in immortality, this only conveys the idea of a change of state; but cold, dark, inane, dull annihilation. And this is the freedom you would have aimed at! You would have thrown off first this, then that, and when you looked for the residue you would have found NOTHING.

Man is a great mystery, he ever wanders between freedom and necessity. Utterly destroy either the one or the other and you annihilate him absolutely. His freedom manifests itself by striving against necessity; necessity manifests itself by the fact that man must *strive*, that he cannot attain this or that end without passing through a medium. Take away freedom, man is a mere passive clod; take away necessity, he is a bursting bubble. A statue is a fine manifestation of man's double position. The sculptor beholds the block of marble a mere cubic mass. He imagines the lovely form of a Venus. The block of marble is not pleasing to his eye, he cannot annihilate it; herein consists his subservience to necessity; but he bids it bear the form he has in his mind, he bids it throw off its first rough aspect, and become a Venus. Here he asserts his freedom. He takes his chisel; the marble is hard, resists him, and he forms it by slow degrees. Here is the struggle between freedom and necessity. At length the statue is complete, the struggle is over, yet the marble is not annihilated; no! man must still acknowledge himself under the dominion of necessity; but he, at the same time, sets on necessity the seal of his own freedom.

TO CORRESPONDENTS.

Aliquis.—Authority is threefold. 1st, *Social Testimony* of facts, historical, scientific, or phenomenal. This authority is merely external, and does not determine "meanings." 2nd, *Individual.* This is your own judgment determining the meanings for yourself by the aid of individual experience. These two, however, are still incomplete without the 3d—*Social testimony of internal facts or meanings.* This is the last and the highest authority, but it is the result of the two former. This latter state, on a Catholic scale, is that which we contemplate as the regeneration of society. A Church, or social economy, may be formed outwardly on Catholic principles before the true Catholic spirit be sentimentally experienced. The intellect may perceive a Catholic mechanism before the moral sense be invested with a Catholic feeling. The intellect makes a system for training the moral being. We institute a school before we educate children. We do not educate children first, and then found a school for them. The intellect is urged to construct by the wants of the moral being; so that, even when acting mechanically for the regeneration of moral nature, it is the servant, not the master of the moral sense. It is the architect of society.

R—n.—The argument of necessity in Calvinism is perfectly philosophical and conclusive, until you come to the corporeal and eternal sufferings of the reprobate. Were it not for this latter misconstruction of the true and sublime doctrine of the eternal punishment of evil (not the wicked, vulg.), Calvinism would be unassailable. Leibnitz, we believe, regarded it as mathematically demonstrable. *R—n* may study the subject very satisfactorily from a small and abridged edition of Calvin's Institutes, published by Cornish, New Turnstile, Holborn. Price 1s. 6d. He will there find our first principles boldly acknowledged without the conclusions.

We are preparing an outline of St. Simonism, but we assure our readers that the difficulty of obtaining satisfactory information on the subject of social science is more than we at first contemplated. The Shepherd will be very valuable to those who are interested in the study; as it will, when completed, contain a plain and intelligible outline of the most celebrated models of association.

E. Truelove.—Not yet bound, call in a week or ten days.

No. 16, Vol. III.]

SATURDAY, OCTOBER 14, 1837.

[PRICE 1½d.]

RELIGION, ACTIVE AND PASSIVE.

God, in the nature of each being, founds
Its proper bliss, and sets its proper bounds.
But as he framed a whole, the whole to bless,
On mutual wants built mutual happiness;
So, from the first, eternal order ran,
And nature link'd to nature, man to man.—*Pope.*

O faith! thou dost constrain us like a spell;
We pass the gulph that parts that world from ours,
Heaven dwells in us, and we in heaven do dwell.

So we imparadise our souls in bowers
Of Asphodel, beneath Elysian skies,
And hold high converse with celestial powers!

These shadows are not, no appearance lies;
But being, and eternal truth, and good,
Pure freedom, and developed energies;
No great, no little, there is understood, &c.—*Heraud.*

As we have had a little controversy with some of our friends and correspondents on this subject of Religious Passivity, we will endeavour in this number to express, in a few words, our own views upon the point of dispute.

Some maintain the necessity of pure passivity in religion. We do not understand what they mean by it, but still they talk about it. Some, on the contrary, insist upon activity only. Probably the two parties may be very appropriately classed under the two categories of Faith and Works. The one believes, relies, and trusts in God; the other employs, actively and energetically, the powers with which God has gifted him.

The Evangelicals, as they are called, preach faith only, or chiefly; for though they profess to love good works as well as their opponents, they regard it as heretical to trust to good works for God's salvation. We think they are right—"God seeth not as man seeth; the Lord judgeth the heart." The Armenian party, on the contrary, maintain that every man must be judged according to his works. This is not only Scriptural, but, in our opinion, perfectly just; for what a man is inwardly, must appear outwardly.

We are, therefore, inclined to adopt both sides of the question, because we cannot get over the difficulties arising from the adoption of one only.

But in order to explain the manner in which we take both sides, let us suppose the following line to represent religion:—

| | | | |
|----|------------|--------|----|
| P. | Faith | Works | N. |
| | Individual | Social | |

Let it also be supposed to represent an electrified rod, having the positive at one end, and the negative at the other; and let us suppose two philosophers to be disputing which of the two contained the original electric principle—To what conclusion would they come? to none. They would end where they began, by acknowledging that P. contained the positive, and N. the negative, and that the one could not exist without the

other. Still the two ends are essentially distinct, and can never be mistaken for each other.

Religion may be viewed in a similar light. It is twofold. There is a religion for the individual, and a religion for society, and these two religions are essentially distinct, wide as the two poles asunder. The one is the reverse of the other. Thus the religion for the individual regards man as mortal; the religion for society regards him as immortal—for society is like the King, it cannot die. The religion for the individual regards man as having an immortal soul; the religion for society regards him as having an immortal body. The religion for the individual regards man as a pilgrim on earth, a mere wanderer through the valley of tears, seeking for a city which hath foundations whose builder and whose maker is God; the religion for society regards him as a proprietor on earth, as having here fixed his everlasting abode, and engaged in constructing a kingdom for himself, which shall merit the appellation of a terrestrial paradise. The religion for the individual sees the fulfilment of the promises of God in heaven; the religion for society expects to realize them on earth, &c. We see, therefore, that there is a polar distinction between the two religions; and yet they are not two religions, but one religion.

Let us examine now the characters of the two religions, in respect to activity and passivity. The religion of the individual is faith, and hope, and resignation, and trust and dependence on God—pure passivity. The more passive it is, the more perfect it is; the greater, also, the faith, and trust, and reliance, the greater the passivity. It is a species of repose, a calm serenity and tranquillity of mind, which troubles not itself with outward things, but looks far beyond the scenery of the material globe, shuts its eyes to the corrupt and adulterated light of the sensual world, and lives in an imaginative world of idea, where God is king, and itself is subject, and where there is no alternation of action and passion, but an everlasting monotony of "Sleep on now, and take your rest; you are in the bosom of Abraham, the father of the faithful." Some, we believe, have carried this passivity to considerable perfection, and are exceedingly happy in the spiritual lullaby with which it rocks them to repose. The possibility of carrying out this propensity, we know experimentally; for we have been so deeply lulled in the lap of its intoxication, that we have ceased even to look at a newspaper for months, and divorced ourselves, to the utmost practicable extent, from every association which was connected with the corporeal being. There is a great happiness attending it; and the greater the faith, the greater the enjoyment. We look back upon the period spent in that state, as on a tale of romance. There is a halo of more than earthly light around it. It seems like a picture of Christ, with an iris on his head, and an expression of divine complacency on his countenance. We sometimes envy those who are in it, and wish we could take a nap at times in the lap of faith and hope, as we used to enjoy it, when we cared not for the world, nor the things of the world, but lived, and breathed, and luxuriated in the visions of God.

And why did we come out of it? Ah! reader, dost thou wish to know that? We can give thee a good reason—because we were but a solitary sheep, and the flock could not follow.

That was the solitary religion of which we spake. It was merely a self-development. It was the positive without its negative—the male without its female. It was spiritual activity, unaccompanied with bodily activity. It was what is vulgarly called a passive state of being. It is worth enjoying, but we do not think it right to enjoy it alone. It is a sin against Nature, unless it be associated with its counterpart, the negative or social religion, which stimulates all the active principles of our nature, and causes us to act as independent beings, to whom the cultivation of the material nature is committed, and by whose exertions society is to be carried out to its ultimate destination. This latter is a converse view of the subject of religion. We are no longer dwelling in seclude meditation on God and our own souls alone, and weaving webs of painted vision in the fairy regions of our fancy, which are never to be realized in material form; but we are engaged in discovering the plans of Providence for society on earth, for man as a race, and not man as an individual. This is what we call the active department of religion, the department which rouses to healthy exertion the inventive faculties of human nature, and cultivates the talents which were not bestowed on our minds to be suppressed, but to fulfil the destiny of man and woman, as the lords of the earth, and the fillers of the ground, which being a wilderness at birth, it is their employment to convert into a fruitful garden, an abode of peace and abundance, and of social harmony.

But why have we forsaken the individual aspect of religion? A religion for the species only is a horrible religion—"A religion which consigns the individual to annihilation, is a religion which never can commend itself to the affections of the children of faith, whose chief delight consists in overlooking the grave, and anticipating that world of vision which you would destroy." You much mistake us if you imagine for one moment that we would destroy it, or that we have lost even a hair's weight of our faith in its reality. It occupies our thoughts daily. We see it foreshown in every object in Nature, in the city, in the fields, in the streets, and on the highway; in the barren heath, and in the luxuriant flower-garden, it is always before us; but it is the passive department of our being, and we keep it in its state of passivity. What can we do to commend ourselves to God, but merely resign ourselves to our fate? Can we persuade him, can we convince or convert him, can we oppose him, or conquer him, or divert the course of his providence by our ingenuity? The more passive we are the better. Our business is to be still,—to believe, trust, and hope in the justice absolute of God—and fret not, pine not, shrink not, from the post which his providence has assigned us, looking for that blessed hope, in which every man, who knows what faith in God means, inwardly rejoices, amid all the trials of life. We would sooner part with our head than part with this. Let society and its millennium go to the wind for us if we are not to rejoice in the hope of the species; if our posterity are to dance and revel on our inanimate ashes, whilst our conscious being has passed into forgetfulness like a puff of wind or the smoke of a cottage chimney, then we say we care nothing at all about a millennium, and would just as soon, like Nero, rejoice in the total destruction of the species as its continuation under such circumstances. The happier men become in an infidel millennium, the more miserable will they feel in the contemplation of death. Nay, we believe, that happiness under such circumstances might be increased until it became a curse, and men would seek the deterioration of their outward condition, merely to make their minds more comfortable. 'Tis thus the two polar aspects of religion act consentaneously. It is impossible to part them. Every thing in Nature is BIPOLAR.

This leads us to a moral, which is this, that the line of duty which God has prescribed for man in this life is twofold—one for himself of passivity, and another for his neighbour of activity. To balance these two duties, so that the one shall not prevent the other, is our *beau ideal* of moral virtue. The mystic puts too much into the scale of passivity, and the materialist too much into the scale of activity. The passivity neglects the outward modes of intercourse best adapted for cultivating the outward and visible department of society. The activity clamours too much about intellect and matter, neglect-

ing the interior being, which enjoys and regulates all the outward phenomena. We consider all the religious sects as specimens of the former. We consider all the infidel and materialist parties as specimens of the latter. The one treats exclusively of solitary religion; the other exclusively of social religion. We prefer a combination of both. A combination of both we will have—the world will have it. Nature demands it—science demonstrates it to be impossible that the two polar aspects can be disunited. Happiness cannot be fully developed without them both; and hence we conclude that both must ultimately be obtained by the revulsion of human feelings against every attempt to effect a separation.

Such is our reply to the *ultra-spiritualist*, and the *ultra-materialist*; such is the position we have taken in religion. Let him who can, demonstrate that he has got a better. Our inability to maintain it, as we perceive it, does not diminish the strength of our assurance, that it is the fulcrum of eternal justice that we stand upon. The more we think of it the more we feel confirmed on our double foundation. We stand, like the angel in the Revelation of St. John, with one foot upon the land, and the other on the sea, and declare the twofold character of true religion, and the decree of the Almighty, that no doctrine, faith, or system, can succeed, which does not proceed upon the double basis of pure passivity and pure activity, viz., *faith and works*.

This truth we send forth to the world as a revelation—infallible. Upon many points we do not speak with authority, but upon this we do.

If it be asked which of the two aspects of religion must be first cultivated, we reply, *both at once*; they mutually cultivate each other, they are both passive, and both active to one another, so much so, that the mystic without society would lose his mind or his creative faculty, and the socialist would degenerate into a mere beast, without the moral re-inforcement derived from solitary meditation. The progress of the two may be illustrated thus—

That is, the positive and negative are produced together, for they both belong to one line. It is not necessary that perfection be attained inwardly before an outward mechanical arrangement be made to elevate still higher the moral being. There are two inward faculties, the moral and the intellectual; the latter may perceive a mechanism to improve the former, and the former may stimulate the latter to invent a mechanism for its benefit. The moral nature cannot be fully developed except in suitable external circumstances, and the intellect only can provide those external circumstances. The moral nature says to the intellect—"I am unhappy, I am fettered, I cannot be delivered without your assistance." The intellect affords its assistance to remove the obstacle, and present facilities of development. These facilities being presented, the moral nature comes out according to its native tendency. Thus the intellect and the conscience are always co-operating; the one removes obstacles and pioneers the way, the other advances and bears the fruit of humanity along with it. The intellect is the male which sows the seed in death; the moral sense is the female which gives it a living organization and conscious being.

This active and passive view of religion inculcates this solitary maxim, upon which we lay a considerable weight, namely, that no man has a moral right to enjoy solitary happiness *only*; that we may err in passive as well as in active religion. The sensualist, who despises the pleasures of faith, and seeks in riot and debauch the *ne plus ultra* of enjoyment, is only the counterpart in the material aspect, of him who rejects the material department of morality, and seeks in egotistic meditation the excitement of spiritual vision. We ought to share our sorrows as well as our joys with each other. We must, while living in this corporeal state, participate in the condition of the world without. Nor even, were it possible entirely to withdraw, can we commend ourselves to an enlightened conscience, if we listen to the temptation. Moreover, there is an excitement of pleasure in the one extreme as well as in the other. By widen-

ing the sphere of your social affections you increase your happiness, whilst you diminish the danger of individual vexation. The pleasure is of a different kind, but still it is remunerative virtuous pleasure, peculiar to the social spirit, and felt by many who are not aware that that very feeling is the source of social religion to which society trusts for its restoration, and in which the Son of Man will be revealed when he comes to judgment.

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon, late Pupil of the Polytechnic School, and Engineer of Mines.

(Continued from page 119.)

"1st. *The compass (or index) of Social permanent Revolution*, since the spur of attraction stimulates us continually, and by impulses as invariable, at all times, and in all places, as the light of reason is variable and deceitful.

"2nd. *Economy of mechanism*, by the employment of a method combining the two faculties of interpretation and impulse; a method adapted for revealing and stimulating at the same time.

"3rd. *An affectionate concert of the Creator with the creature*, or a conciliation of the free will of man, obeying by pleasure, with the authority of God, commanding pleasure by attractional impulsion.

"4th. *A Combination of the useful with the agreeable*, of benefit with charm, by the interposition of attraction in productive labours, where it ought to engage us passionately, as towards the whole will of God, of which it is the interpreter.

"5th. *A diminution of coercive means*, such as gibbets, constables, tribunals, philosophers, and other parasitical wheelwork, which the civilized and barbarous order interposes for the maintenance of industry, always repugnant out of the series of "passion."

"6th. *A collective reward of docile globes*, (passions)* by the charm of an attractive regime, and a collective punishment of rebellious globes without the employment of violence, by the incentive alone of desire, or the martyrdom of attraction, which is the negative punishment for rebellious and obstinate globes, living under the laws of men.

"7th. *The alliance, or co-operation (ralliement) of sound reason with Nature*, that is to say, the guarantee of the acquisition of riches and happiness, which are the wish of Nature, by the practice of justice and truth, which are the desire of sound reason, and cannot reign but by Association.

"8th. *UNITY INTERNAL*, or the peace of man with himself; an end of the state of internal war, which organizes the civilized state, by putting passion and attraction in every man at variance with wisdom and law.

"9th. *UNITY EXTERNAL*, or the relations of man with God and the universe. The world, or the universe, not communicating with God but by the interposition of attraction, no creature, from the stars down to the insects, arriving at harmony, but by following the impulses of attraction, there would be duplicity of system if man were to follow another law than attraction to attain the object of the Divine plan, viz. harmony and unity."—(Treatise of Domestic Agricultural Association.

Even though we do not perceive at first the possibility of satisfying impassioned attraction, we will admit without doubt, that such a principle is superior to those which have been proposed in these latter times as the basis of Association. We must acknowledge, for example, all that there is of vagueness and barrenness in the definition given by St. Simonism.—"Association ought to have for its object the moral, intellectual, and physical amelioration of the most numerous class." A generation flattered from infancy (bercéé) by the recital of the great things which its fathers have accomplished, to deliver

* *Des globes dociles*. Fourier has a peculiar style, and as he carries out his system in idea to the universe, each passion seems to be regarded by him as a moral globe, revolving round its central sun. This idea will explain the meaning of docile globes, which we have translated literally.

themselves from oppression, would not apparently associate for the purpose of maintaining and consecrating the "exploitation" of the people. To have imagined that the preceding definition virtually contained a social doctrine, and to have presented it to the world with such feeble appurtenances (*bagage*) as the foundation of a new era, is a presumption which the enthusiasm of faith, and the desire of being useful, sufficiently explain. But it is also an error, which it is well to confess, were it for no other reason, than putting ourselves in agreement with a man whose whole life was employed in seeking a remedy for social miseries, and who said in 1817, "It has now become a general maxim, that rulers ought to labour for the good of the governed, but a principle is not a science. An axiom so vague does not suffice to point out the duties of the public man; for whatever measure a minister attempt, he always persuades himself very easily that he works for the interest of the subject. And if it be pretended that this principle is sufficient to constitute the science of obligations, which belong to the character of a public man, it may as well be said that morality is completed (*as a science*) when we have determined that it ought to have for its object the happiness of men."—(St. Simon, Industry.)

The principle of the amelioration of the most numerous class throws no new light upon the question of association. But if it be replied, "Here is a social mechanism in which human passions, instead of being as now an occasion of disorder and ruin, will become, on the contrary, a powerful means of harmony for the whole, and a sure road to happiness and riches for individuals," we have then a point of departure well fixed, and it only remains in order to appreciate the value of such language, that we examine with attention,—1st, if its author has made an exact and complete analysis of human passions; 2nd, if he has in fact discovered a mode of association which permits their free development.

I will soon arrive at this examination; but, as they have insisted much, in these latter times, on the value of the historical argument to support their provision of futurity, as they have established with reason that a theory of general destinies cannot obtain credence but in giving an account of the past, and pointing out in the present the germs of the future which it announces, I will say here some few words on the manner in which M. Fourier views the development of human society.

TWOFOLD DEVELOPMENT OF SOCIAL DESTINY.

Human nature having received all the passions necessary to association cannot escape individual sufferings and general calamities, if despising the social permanent revelation (impassioned attraction), it persists in living in *industrial incoherence* and *family partyism* (morellement familial) which are diametrically opposed to the plan of Providence. Moreover, always admitting a real progress in the chain of the four known societies (savagism, patriarchism, barbarism, and civilization), a progress characterized principally by the development of the sciences and of great industry, M. Fourier considers these four societies as the four phases of human infancy, and classes them together as the unhappy period in the *movement subversive*.

Human nature is developed by a harmonic or a subversive movement according as it obeys or resists the divine will manifested by attraction.

This twofold action of the social movement is in conformity with the twofold action of the material movement; which presents to us the planets as having already attained to the social state, whilst the comets are still in the state of incoherence.*

* "Exploitation" is a word which we cannot translate, it literally means the working of mines, land, &c.; but metaphorically applied, it means the working the value out of a man for your own ends, "making a chop" of him, or "bleeding him," as the vulgar say. The people would not apparently unite for such an object; to tell them, therefore, that amelioration is the object of union is telling them a mere truism, "bagage." We think the word would be adopted by the English if it were not harsh in sound.

* M. Fourier considers comets as embryos of planets destined to acquire as well as the latter a regular and sure movement.

Unity of system with duality of development is according to M. Fourier one of the principle laws of movement.

By these considerations M. Fourier escapes the difficulties which the partisans of absolute progress encounter. These, in fact, are obliged to labour to prove the infinite goodness and wisdom of Providence in the great catastrophes, which have desolated the human race, such as general wars, the invasion of barbarians, &c.† M. Fourier thought it derogatory to Providence to attribute to him the employment of such means of progress. According to him, all the calamities of which history has preserved the remembrance, all the scourges which still afflict us, are the punishment (*indirect*, for the spirit of vengeance cannot be allied with the idea of Divine Providence) of a creature who resists the law of his own being, the law which is incessantly being revealed to him by attraction, and which stimulates this creature to association, and not to disunion (*morcelement*). This explanation appears to me very beautiful and satisfactory. It is presented under a remarkable form in the following passage:—"We would comfort the mind by saying 'Providence does not protect the poor; it wishes that they should be unhappy, spoiled, and persecuted in civilization.' Every one would reply that I accused Providence of an evil which we ought to impute to the egotism of riches and the unskillfulness of legislators. That is nothing, the assertion is rigorously correct, thanks to the last word in CIVILIZATION; for Providence who does not approve of the civilized order, or of divided labour, would be in contradiction to itself, if it did permit the poor class, called plebeian, to attain, by divided labour, the happiness which it would enjoy in the social regime or combined labour, with great combinations and great economical means."—(*Treatise of Domestic Agricultural Association*.)

When M. Fourier passes from generalities to detail, when he analyses the characters and properties of different societies, and especially of civilization, above all, when developing this idea of a world turned upside down, he shows in all the vices of the present state, a reaction of passions compressed, an *image reversed* of the virtues of the social or harmonic order—he throws upon the whole of this subject an unexpected light, and shows himself far superior to those who have heretofore attempted the critique of our epoch. But I will not dwell upon these matters, which would require lengthened expositions. It must suffice for the present to have made known the general view (*la vue d'ensemble*) which M. Fourier takes of history.

ANALYSIS OF THE PASSIONS.

The first enjoyments to which man aspires, those which, before any thing else, he strives to procure, are riches and health. If man does not enjoy these advantages, he cannot develop himself in any relationship. The first focus of attraction, then, is luxury (internal luxury, or health—external luxury, or wealth). Attraction tends to luxury by five sensual means, to which the social scheme ought to give the fullest scope and satisfaction. "But," says M. Fourier, "the senses are not alone the sources of sociability, for the most influen-

The modern application of the calculus to the movement of comets, does not contradict this character of incoherence which M. Fourier attributes to them. In fact, the plains of their orbits, like the nature of their movements, does not agree with the simplicity which is observed in this respect in the planetary system. It is true that the Newtonian theory gives no explanation of these facts (the almost perfect coincidence of the orbits and common direction of all the movements of the translation and rotation of the planets). The hypothesis of Laplace on this subject, has not, properly speaking, any scientific value, not being supported by the verification of numbers. This feebleness of science, in the face of a class of facts so important and so much more striking than the phenomena known under the name of the laws of Kepler, attests a great retardation in the progress of the human mind. This ought to prove a serious caution to all those who endeavour to repel the ideas of M. Fourier upon cosmogony, merely because they are novel.

† See for example, a pamphlet, entitled "Five discourses to the Pupils of the Polytechnic School, on the St. Simonian Religion." (1830.)

tial of the senses—taste, or the appetite for nourishment—leads to anthropophagy." The senses are only auxiliaries, or stimulants (*renforts*) of sociability, as the pleasure of the table, which renders friendship more lively and more cordial. By this simple observation, that the passions, materially considered, do not furnish of themselves any social tie, we are saved from all the difficulties into which we launch, by proclaiming vaguely the restoration of matter (*rehabilitation de l'matière*).*

That which especially characterises human nature, that, indeed, which particularly distinguishes the animal creation, is its tendency to form groups, or passional leagues. Friendship, ambition, love, and familism, are the true motives of sociability—the sources of all social relationships.

Any one of these four passions suffices to form a group, but even in the same group borrowed motives may intervene between two or three of these passions, or even between four.

M. Fourier illustrates the properties of elementary groups. The result of his analysis is of such importance, that it will be better for me to quote verbatim.

"Each of the groups is produced by the impulse of two principles, or motives; the one spiritual, S, the other material, M—a table of which follows:

ELEMENTARY SOURCES OF THE FOUR GROUPS.

First Group of Friendship.

S. Affinity (spiritual) of CHARACTERS.

M. Affinity (material) of industrial *propensities*.

Second Group of Ambition.

S. Affinity (spiritual)—combination for GLORY.

M. Affinity (material)—combination for *Interest*.

Third Group of Love.

M. Affinity (material) by the CHARM OF THE SENSES.

S. Affinity (spiritual) by the *Ties of the Heart*.

Fourth Group of Family.

M. Affinity (material) by CONSANGUINITY.

S. Affinity (spiritual) by *Adoption*.

This simple table teaches us more than volumes upon the practice of life. In the first place, if one of the two motives is deficient in a group, it is vitiated. "Simple groups, with single motives," says M. Fourier, "are generally

The contemptuous tie—by the domination of the material.

The tie of dupey—by the domination of the spiritual."

We see, then, by the disposition of the letters S and M, that the spiritual motive holds the first rank in the two groups of friendship and ambition, and that the material motive rules in the other two. This is more full of meaning and truth than the attempt to unite spirit and matter, by giving them in all relations an equal importance, as does the St. Simonian doctrine. It is so, also, with the pretended equality of man and woman. M. Fourier is more in truth and nature, when he attributes to man a predominant influence in the two first groups, and when he declares, without hesitation, the superiority of woman to man in the other two orders of relationship.

I will also transcribe two tables on the attraction and tone (*ton*) of the groups. "If danger is to be braved in the case of war, of robbery, or incendiarism, we will see the four groups submitted to influences very different. Each of the groups also adopts, in internal relations, a tone which is peculiar to itself.

ATTRACTION (*l'entraînement*).

1st Group of Friendship.

All are attracted in confusion.

2nd Group of Ambition.

Superiors attract inferiors.

TOPE.

1st Group of Friendship, or Equalization.

Cordiality, and Confusion of Ranks.

2nd Group of Ambition, or Ascendancy.

Deference of inferiors to superiors.

* This is a St. Simonian idea. The restoration of matter, or rehabilitation of matter, is the sanctification of the sensual or corporeal nature, and corresponds to the theological idea of a glorified body.

| | |
|--|--|
| 3rd Group of Love. Women attract men. | 3rd Group of Love, or Inversion. Deference of the Strong to the weak sex. |
| 4th Group of Familism. Inferiors attract Superiors. | 4th Group of Familism, or Descendance. Deference of Superiors to Inferiors. |

It must be understood that these properties cannot always be observed in the present system, where the passions are compressed and entangled. It is thus, also, that parents cannot obey the laws which Nature has established in regard to the fourth group. They are naturally induced to treat their children as little gods; but because there is no counterweight to their indulgence, they are constrained to whip and lecture them; and it happens that God not having given children attraction towards the forms of education, children are at war with their parents.

We can comprehend, also, by these tables, into what modes of despotism a society will be conducted, which, knowing only the *hierarchical* laws of the second group, would nevertheless associate all the passions. If we know only these two principles of association, "Superiors attract inferiors," and "Inferiors owe deference to superiors," (the principal regulators of the groups of ambition) and strive in the mean while to rule familism, friendship, and love, then we must come, by a logical necessity, to consequences which must necessarily destroy all human dignity, and all perfect liberty.

I have yet spoken only of five sensitive passions, and of four affections of the soul (*affections animiques*), which are known to all. But there are three other passions hitherto despised or condemned by all professors of morality, and which M. Fourier reclaims as being *passions of harmony*, which cause the *animic* and *sensitive* passions to agree with themselves and each other. These three passions are the essential sources of social organization. They serve to form the series of groups which exist in association only. Moreover, these three passions having no employment in the state of civilization are there very hurtful. For greater precision I will borrow the author's own definitions.

The *first* of these three passions is—"The spirit of party. The speculative spirit. It is the passion for intrigue, very ardent in courtisans, the ambitious, the commercial, the world of fashion, &c. The Cabalistic spirit always mixes up calculations with passion. All is calculation with the intriguing. The least gesture, even a wink of the eye, it does all with reflection and celerity. This ardour is then a reflective spirit. (*Fougue réfléchie*).—(CABALISM)."

The *second* is "a blind passion, the opposite of the preceding. It is an enthusiasm which *excludes* reason. It is the captivation of the senses and the soul,—a state of intoxication, of moral blindness,—a kind of happiness which arises from a combination of two pleasures, one of sense, and one of soul. Its domain is especially love. It operates also upon the other passions, but with less intensity.—(COMPOSITISM)."

The formation of the barricades in July is a good example of Compositism, showing how, by a blind passion, we can do rapidly, and in perfection, that which in cool blood would require much more time, and be executed in worse style.

Suppose now, two vessels which rival in speed, to enter port. The crew will bring to the contest a precision, a skill, an ardour, which, without doubt, would not be so great without the emulation which animates them. This is an example of *Cabalism*.

The social process of M. Fourier puts every one of these passions into play in all employments. We ought to understand that this is a method of rendering labour infinitely more productive than it is at present. But it is necessary to effect frequent changes with labourers, for the spirit cannot support for a long time any one of these two violent states. Rivalry would become hatred, and enthusiasm madness. This consideration leads us to the third of these deliberative passions.

"*ALTERNATISM* or *FICKLENESS*, is the appetite for periodic variety, contrasted situation, change of scene, stirring incidents, novelties proper to create illusion, to stimulate at once the

senses and the soul. This want is felt in a moderate degree every hour, and keenly every two hours. If it is not satisfied, man falls into weariness and ennui."—(Summary, p. 1400).

"Such are, according to M. Fourier, the essential springs of attraction, the twelve Radical passions of which are

5. *Sensitive, tending to luxury;*
4. *Affective, tending to groups;*
3. *Distributive, tending to series of groups.*

The development of these twelve elementary passions produces *UNITISM*, or the passion of *UNITY*, as the re-union of all the colours produces white. However, it may be well to understand that these twelve are not the *only*, but the *principal* passions. Their combinations and changes form a great number of mixed passions, as the mixture in different proportions of the principal colours of the solar spectrum forms a variety of mixed colours.

I have just spoken of that which is common to all men; but human association is the harmonic employment of individualities. It is of importance, therefore, to know that which distinguishes individuals. It is necessary to class characters. That which constitutes character is the dominion of one or more passions. The title of the character is valued by the number of dominant passions, and the more elevated this title is, the more also is the social destiny of the individual. Thus those whom M. Fourier calls *solitones*, have only one dominant passion. "These characters are the most numerous. They vary less than the others in their tastes; they have an aptitude for works of a long duration. In fine, says M. Fourier, they are in the scale of characters, that which private soldiers are in a regiment." On the contrary, in proportion as the title is elevated, the corresponding character is of a rarer species; but it is also apt to interfere in a great number of functions.

Here is a very important idea in the theory of association. According to M. Fourier, Nature does not produce characters by chance, but in a fixed and determinate number according to their titles, so that when society shall have passed from its present incoherence to social organization, every individuality will have its proper place, and every character will be in the universal order like a necessary note in an immense concert. In general terms this assertion is conformable to our ideas of unity and universal harmony. We even feel that association is impossible, except upon this condition, for it is necessary that the characters which correspond to this or that function, be neither in excess nor defect. But, this acknowledged, it may, perhaps, be considered hazardous to proceed further, and to wish to determine the strict proportions in which the different species (titles) of character are produced before an incipient attempt at association have put all the individualities to the test. M. Fourier also, in giving these proportional numbers, does not consider their valuation as the first point of importance in the examination of his system; that which he demands is, that we meditate, before every thing else, on the social mechanism or art (*procédé*), by means of which he promises to harmonize the antipathies, as well as the sympathies, the natural discords, as well as the concords; it is, that we apply ourselves to ascertain if by his mode of association, we shall be able to put in play, without danger, and employ with advantage, the Radical passions. Then the question of characters will be partially solved, since the individual character results from the development of some one of these passions.

(To be continued.)

THE TRANSCENDENTALIST'S DIALOGUES.

No. XIII.

ON "FINITE BEINGS."—(Continued from p. 120.)

Transcendentalist—Idealist.

Ideal.—Is there not in the bosom of man an appetite after infinity, a longing after something which is not to be found in the sensible world? Does not every present object surfeit us after a while, so that we are impelled onwards to a desire to learn it, and wander in some unknown region? In your dialogues with the Materialist, you showed how any one compre-

hended object ever supposed a something beyond—that the determined, as it were, floated on the vast surface of the undetermined. To the faculty which produced limitation, and thereby constituted an object, you gave the name of the understanding. This understanding was the limiting power, there always was something beyond its reach, yet even its own capacity was almost (perhaps quite) infinite. Where is the quantity too great for its apprehension, nay, great enough? Give any finite number, the rapacious demands of the understanding are unsatisfied, it can conceive a still greater number—give any finite extension, it can grasp one still more extended. Even this bounding power seems desirous of infinity. It seems desirous of bounding the boundless. Every thing in man seems destined for eternity. The imaging power is ever soaring beyond the reach of the understanding, which is, itself, so vast, that no finite universe will fill its grasp. Yet these very faculties, soaring and ambitious as they are, do but prove our finity. They are manifested by a perpetual struggle with necessity.—Stay, methinks I am wrong.

Trans.—How so?

Ideal.—Why, it now seems to me, that the imaging power is the primary producer of the universe.

Trans.—Why that is what you thought at first.

Ideal.—Aye, but see my difficulty. I then looked upon myself as the origin of the universe, though I now see how absurd was my position. Now I find that I am not independent of the things around me. This table, for instance; I cannot banish it, nor can I, without trouble, even change its form. There it is, a round table, and however I may wish it to be square, I cannot make it so without some knowledge of carpentry, nor even with that knowledge, without consuming some time. Here is the point. How is it that I am not master of the creations of my own imaging power?

Trans.—When did I ever call these things around us the creations of the imaging power?

Ideal.—Psha, psha! you cannot get off that. You know as well as I do, that a mere sensation is no image.

Trans.—But the undetermined mass that precedes all,

Ideal.—Is itself formed by the imaging power, running from one point to another, without being checked by the understanding.

Trans.—But what are the points?

Ideal.—I scarcely know.

Trans.—Then let us see if at any rate we can hit on some hypothesis which may explain this really abstruse subject. I scarcely think you are wrong in supposing the imaging-power to be one of the producers of the universe, and fully acknowledge the difficulty which meets us, when we find their creations stubbornly resisting our will. Perhaps we may find that the imaging-power can scarcely be called “our own,” but may be a kind of fibre taking its origin in a being superior to ourselves, and from which our own being depends. The points are, I think, single sensations, from the union of which, as we know, objects arise. Understand by sensation, I mean that in an object which is distinguished from form or order, I can render my meaning plain by an example. Look at this red piece of paper, the redness is the sensation. This redness may be considered as distinct from the form or size of the paper, a mere dot will give as perfect a sensation of redness as an acre stained red. Now this sensation does not at all seem to be produced by ourselves, it is no image, consequently no product of the imaging-power. But it is that which precedes an image, which renders an image possible.

Ideal.—To concentrate our researches, let us confine them to visual objects, which are more evident than others. Mere colour irrespective of form is the sensation.

Trans.—Well, imagine a person as yet having received but one sensation, and utterly ignorant of form. Let us suppose the person lying on his back on a cushion so soft, that the sense of touch is not called into play, and let us suppose his eyes fixed on a clear blue sky. This blue is to him unbounded, consequently has no figure. Well, let us now suppose a sensation of white to strike him. Were the blue sensation utterly at an end, utterly erased, the person would not be aware that the sensation was a new one. Now the imaging-power comes into play,

it unites both these sensations; but how is this? A person cannot both have and not have a sensation. Here comes succession to the solution of our difficulty,—the imaging-power begets time, and these sensations are successive. But, at the same time, in its course it seems to dwell on the very sensations, and as it were to extend them, or beget space. I acknowledge that this last sentence is somewhat crude; it is but the germ of an idea, and not idea fully developed, and I request you, my good Idealist, as well as all my kind readers, to bear in mind that I do not consider myself in possession of a system which I am explaining to the unlearned, but these very dialogues are my own method of learning. I utter the thoughts as they rise into my head, set them down as soon as uttered; and, therefore, though a subsequent dialogue may vary a little from a former one, my readers must not accuse me of inconsistency, as they will have before their eyes the very train of thought which may cause me to veer from one point to another. I expressly desire that the dialogues may be regarded as a whole.

Time and space, as is well known, are measures of each other. How do we know that an hour has elapsed? Why, by the fact, that the hands of the watch have gone through a certain space. If we were walking on a long road without any mile-stones, how should we know we had walked a mile? did we not know how long a time was taken by such a process, and then to take a watch out, and ascertain what time had passed? In short, a wide space is that which it takes a long time to traverse, a long time is that in which you traverse a large space.

Can we not conceive time and space to be twin children, neither prior, but each essential to the other, and both the experiments of some primitive power? Let us, by an act of the highest imagination and abstraction, consider A as the centre of power to all space or time. Let us consider it now as begetting space; does it not gradually widen its influence, and at once beget time?

But while I am uttering these very words a curious idea has struck me, which I will resume for the next dialogue.

SIX LECTURES BY MR. OWEN,

WITH AN ADDRESS TO CONGRESS, &c.

Heywood, Manchester, 1837. 2s.

(Concluded from our last.)

The business of this class will be to govern the home department, in such manner as] to preserve the establishment in peace, charity, and affection; or, in other words, to prevent the existence of any causes which may disturb the harmony of the proceedings. And this result will be most easily effected for the following reasons:—First, because they will know what their own nature really is, and that, the convictions and feelings of the individuals are not created by their will, but that they are instincts of their nature which they must possess and retain, until some new motive or cause shall effect a change in them.—Secondly, because, in consequence of this knowledge, all in the establishment will be rational in their thoughts, feelings, and conduct; there will, therefore, be no anger, ill-will, bad temper, inferior or evil passions, uncharitableness, or unkindness.—Thirdly, because no one will fall fault with another for his physical, intellectual, or moral nature, or acquired character; as all will know how these have been formed; but all will, of necessity, feel a deep interest in doing whatever may be in their power, by kindness directed by judgment, to improve these qualities in every individual.

Fourthly, because there will be no poverty, or fear of poverty, or want of any kind.

Fifthly, because there will be no disagreeable objects within

or around the establishment to annoy, or to produce an injurious or unpleasant effect upon any one.

Sixthly, because, according to age, there would be a perfect equality in their education, condition, occupations, and enjoyments.

Seventhly, because by their training, mode of life, and the superior arrangements, in accordance with, and congenial to their nature, and by which they would be continually influenced and governed, they would, very generally, if not always, enjoy sound health and good spirits.

Eighthly, because there would be no motive to engender ambition, jealousy, or revenge.

Ninthly, because there would be no secrecy or hypocrisy of any kind.

Tenthly, because there would be no buying or selling for a monied profit.

Eleventhly, because there could be no money, the cause now of so much oppression and injustice.

Twelfthly, because there would be no religious or injurious mental perplexities or estranged feelings, on account of religious or other differences of opinion.

Thirteenthly, because there would be no pecuniary anxieties, for wealth of superior qualities would everywhere superabound.

Fourteenthly, because there would be no disappointment of the affections; both sexes rationally and naturally enjoying the rights of their nature, at the period designed by Nature and most beneficially to insure to all virtue and happiness.

Fifteenthly, and lastly, because every one would know that permanent arrangements had been purposely devised and executed to ensure impartial justice to every one, by each being so placed, trained, and educated from birth to maturity, that he would be, as he advanced in age, secure of experiencing all the advantages and enjoyments which the accumulated wisdom of his predecessors knew how to give to the faculties and powers which he derived from Nature.

This class of domestic governors would, naturally, for order and convenience, divide themselves into sub-committees, each of which sub-committees would more immediately superintend or govern some one of the departments, which would be divided between them, in the best manner their experience would direct. In this manner the whole business and affairs of each association would be governed without jealousy or contest. And as each establishment would be kept in high order, and as no cause which could create disputes or differences would be permitted to remain, there could be little to govern in families thus made rational; every member of them being, from their birth, placed within rational arrangements, and surrounded solely by rational external objects.

By these arrangements and classifications, every one would know, at an early age, that, at the proper period of life, he would have, without contest, his fair full share of the government of society.

But final decision upon every doubtful point of practice must rest somewhere; and it is, perhaps, most natural, that this power should be vested in the oldest member of this class, who will possess this precedence for one year only, because, at the termination of that period, he will be superseded by the next senior member of this class, and he will become a junior member of the eighth class, which will consist of those from forty to sixty years complete.

After providing for the production of wealth, for its preservation and distribution, for the training, education, and formation of character from birth to maturity, and for the internal government of each establishment, it is necessary to make arrangements, to connect each establishment with all other establishments founded on the same principles, or to form what may not be improperly called the external and foreign arrangements.

The eighth class will have the charge of this department; a department so important to place under the direction of the best informed and most experienced yet active members of society. The individuals from forty to sixty years of age will be so informed and experienced as a class, after they shall have regularly passed through the seven previous classes.

Their business will be to receive and attend to visitors from

other establishments; to correspond with other establishments; to visit, and to arrange the general business of public roads, conveyances and exchanges of surplus produce, inventions, improvements and discoveries, in order that the population of every district should freely partake of the benefits to be derived from the concentrated knowledge and acquisitions of the world, and that no part should remain in an ignorant or barbarous state. For by these means a new power of invention and discovery will be opened to mankind, many millions of times more efficient than that which has ever yet been in action, and more will be accomplished by it, for the advance of the improvement and happiness of the human race, in one year, than can be attained under this old, ignorant, wretched and irrational system in any given period.

The members of this class will circumscribe the world in their travels, giving and receiving in their course the most valuable knowledge, and continually interchanging acts of friendship and kindness with all with whom they come into communication. Their wants, wherever they may go, among these new family associations, will be most amply supplied; for there will be, every where among them, a large superfluity of every kind of useful or desirable wealth. The most varied and delightful sensations, appertaining to human nature, when the physical, intellectual, and moral powers and faculties, shall be called forth in their due order and proportions, and cultivated in the superior manner previously described, will be continually called into action, and this period of human life will be one of high utility and enjoyment. For the earth will not be the wild barren waste, swamp, or forest, which, with some exceptions, it has ever been, and yet is; the united efforts of a well trained world, will speedily change it into a well drained, highly cultivated, and beautiful pleasure scene, which, by its endless variety, will afford health and enjoyment to all, to a degree, such as the human mind in its present degraded and confined state, has not the capacity to imagine. For the human faculties have been cultivated to have a perception of regions of torment, but never those of happiness; the hitherto fancied heaven of irrational man, would be a state of stupid monotonous existence, most unsatisfactory to an intelligent rational being.

By these arrangements being carried out to the extent intended, the whole human race, from the age of forty, would be, in reality, more truly sovereigns of the world, than any one is now sovereign of any empire or kingdom. These superior rational beings would have all the productions of the earth, which they could use or enjoy much more effectually at their control than any sovereign can now command them. Those men of the new classification would all be well trained and properly prepared to make the best use of wealth, and to obtain its highest permanent enjoyment without making abuse of any part of it. And these high enjoyments would be yet enhanced to these men, by the knowledge that they were not depriving a single human being of similar privileges and advantages, but, on the contrary, that each one of their fellow-men would derive additional gratification from witnessing or knowing that this control, over all the enjoyments which the world, in its most highly cultivated, or best state, could afford, was thus possessed by so many of their fellowmen, justly and advantageously for all other classes, and which privileges and advantages all these classes would also, at the proper period of life, equally enjoy.

Time will not admit now of more extended detail of this interesting part of the subject, for this portion of it, like the former, would require an extended course of lectures to do it full justice.

The next lecture must conclude the present course, and, according to promise, will include the outline, and as much as the time will admit, of the detail of the mode of applying these principles to practice under the new classification of society.

[We refer to the work itself for that.]

MR. OWEN'S VISIT TO PARIS.

Our readers are well aware, no doubt, that Mr. Owen has lately paid a visit, by express invitation of a numerous party of

friends, to the French metropolis, where he has produced a very powerful sensation. His arrival was publicly notified in the Parisian journals: many gave a copious account of his life and writings, with such a compendious outline of his system, as could be conveniently inserted within the narrow limits of a French newspaper. The provincial papers of France, would follow of course the example of their metropolitan leaders. So that the name and history, and social system of Mr. Owen have within these two months last, been published to the whole mass of the French population. Foreign journals (not *English*), would most probably inform their readers what the French metropolis was for a season amused with; and thus we may safely say that this year has revived the reputation of Owenism upon the Continent, where for a long period it had been slumbering in oblivion. But we have not the fact of publicity alone to justify us in making this sanguineous observation. We are also assured, by eye witnesses of the enthusiastic reception which Mr. Owen experienced in the French capital, that he has a very large and respectable party of friends in France. The large hall of the Hotel de Ville, in which he gave his first lecture, was crammed with about two thousand people, anxious to see, for they could not understand, the Apostle of Socialism. Mr. Owen addressed them in English, and M. Precorbin translated after him in French, and did so with such fluency and ease, that the substance of Mr. Owen's lecture was communicated to the whole assembly, without losing any more of its force, than would have been conveyed by the mouth and lungs and personal influence of the social Father himself. Men of every rank expressed their approbation of his plan, even members of the court itself, one of the French King's aid-de-camps being an acknowledged advocate of the new system; the Duke de Montmorency also presided over the association, which was formed on Mr. Owen's arrival. Men of rank, talent, and learning rallied around him; respectability was given to the promulgation of his doctrine, and a new spur inserted in the sides of the French nation, which perhaps will teach them better how to proceed, when they have once more upset the fabric of their political Babel. Mr. Owen was astonished as well as pleased at the freedom of the French people, a freedom existing in the midst of political despotism, a moral freedom which we in this country know nothing of, notwithstanding the boasted advancement of our political liberty; but a freedom so far superior to mere *police* emancipation, as to induce Mr. Owen to think that despotic countries would yet take the lead in the great work of social amelioration. Politics are *down* in France. The French are looking beyond them; and lucky would it be for us also, if instead of palavering with trifles, such as ballot, and canvass, and poor-law amendments, and other minor subjects of legislation, we were to cast all this small ware at once overboard, and raise one loud and universal national shout, for a great social reorganization of the commonwealth; we may labour for ever at this patching and mending system, which is a miserable delusion, that will bring this and many other generations in sorrow to the grave, and leave our posterity in the mud of legislative mysticism, after all.

Lest our readers, however, should misinterpret the meaning of the above paragraph, and suppose that there exists a concert of social and intellectual feeling in Paris upon the subject, we must inform him that there are many fools in France as well as in England; and that Mr. Owen has got his own share of that remarkably numerous portion of our species; and these played a very unfair and illiberal game, not very consistent with the character of men who profess to follow the maxim of "no praise, no blame;" many of them objected to invite old Fourier, the Father of socialism in Paris, now white with age, to the banquet, and even objected, moreover, to the friendly offers of co-operation which the Fourierites made; thus tending to produce a spirit of party at the commencement; but it was well that such foolish overtures were over-ruled, for although Owen is now in the ascendant, the scientific power of Fourierism, which has captivated some of the most able and enlightened minds in France, must always entitle it to such veneration and respect, that it would be impossible for any system to succeed by despising it. The fact is that the excellences of all men must be united. This is Fourier's own doctrine, and the

man who thinks he knows all and can be taught by none, is the very worst socialist and the worst co-operator that ever God created. Fourier and Owen were personally introduced to each other; but neither understood the other's language.

The banquet to Owen was very splendid, and about seven hundred people sat down to it. But the police prevented him from continuing his lectures, on account of the popular commotion they occasioned. Mr. Owen has been promised an interview with Louis Philippe when he returns from Germany, where he has now gone to urge the adoption of his system on the crowned heads. He is striking at the wrong nail we fear; but still there is a propriety in the act, were it for no other purpose than obtaining that publicity, which always radiates from a court. But, there is another and a better reason, which is, that the men in power be left without excuse, should the people soon, rising up as one man, and like a giant refreshed with new wine, demand the concession of the social rights of humanity, in a manner not very conformable with the laws of good breeding.

TO CORRESPONDENTS.

C. L.—*The letter addressed to C. L. we will give next week. In the meanwhile let the writer read our leading article of this week, which was written the evening before we read his epistle. We will comment on the letter, which is pure materialism, or what some call rationalism; perhaps the most mystical of all isms, because it places happiness in knowledge, i. e., the comprehension of the incomprehensible. May heaven preserve us from the tyranny of human intellect! Intellect is too high already; it has overpowered the moral feelings. It is the dominion of intellect in Church and State that we abhor; give us sensibility in preference to intellect, if we must have only one of the two, but we would rather have both; put down the usurper, and make a commissioner of him.*

A Universalist.—*We certainly did take offence at a Universalist calling our doctrine Omnibusism; moreover, we had a good laugh over it, but since he disclaims any intention to offend, we are perfectly reconciled. His two half sheets were folded separately, the one being an envelope to the other,—this is equal to a double letter—they ought to be folded together. We are perfectly satisfied with his conduct, and regard him as an intelligent correspondent. Had the word omnibusism not been applied to our doctrine, we would not have mentioned the sixpence, but having received a cut, we thought proper to give one. Many whom we respect much less, and know as little about, have put us to double the expense for a single letter, and we have been silent, regretting only that the feelings of our correspondents were not so delicate as our own.*

A letter for the Transcendentalist has been lying in the shop for more than a week.—We would feel obliged to him if he would send his copy on Friday morning, as it has of late put the compositors to considerable inconvenience.

B. R.—*Lord Bacon did write a work on a social form of government called "Nova Atlantis," but he left it unfinished. We agree with our correspondent, that all philosophy is twaddle compared to social science, and science of every description is only to be valued by its tendency to social amelioration. We recommend a careful perusal of our analysis of Fourier's system. The man who has not read Fourier has some very curious and simple truths to learn about his own nature, and the destiny of his species. But the three systems of modern times have all their peculiar excellences, and supply defects in each other. Fourier has analysed man; St. Simon has analysed history and progress; and Owen the influence of external circumstances. It is the Trinity personified as the herald of the millennial state. We learn from each as the son of all.*

L. Pitkethly will receive it in a week at farthest.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 17, Vol. III.]

SATURDAY, OCTOBER 21, 1837.

[PRICE 1½d.]

WHAT HAS RELIGION DONE FOR SOCIETY?

I ask for justice! I prefer
An equitable suit!
I appeal to the law, and the case
Admitteth of no dispute.

If there be justice here,
If law have place in heaven,
Award upon this bond
Must then for me be given.—*Southey.*

We hope the reader remembers the distinction which we drew last week between individual and social religion, as it will prevent any misconception of the language which we mean to employ at present. We divided religion into individual and social thus—

Religion.

P. Individual———Social. N.

We spoke also of the possibility of developing these two aspects of religion in such a disproportioned manner as to give too much preponderance to either. Individual religion may be developed passively in mysticism so exclusively as to become a species of monachism, and social religion may be developed actively so exclusively as to become infidelity, by neglecting the cultivation of the private feelings of faith and hope, in which individual religion consists. We maintain the necessity of cultivating both departments, both the active and passive qualities of religion; for otherwise it is not perfect, but in either case is an unnatural counterfeit of what is, in our estimation, the all-comprehensive and only virtue.

In order to answer the above question therefore, accurately, it is necessary that the answer be twofold. It is necessary to determine whether religion has proved a comfort to the individual, and whether it has proved a comfort to society; and, moreover, we must determine whether it has leaned most to the self-development, or the social-development.

Moreover, if we should find that it has leaned too much to one side, and thus destroyed the equilibrium between self-love and neighbour-love, and thereby produced positive evil, it does not, therefore, follow that religion itself is positively evil, but only that it has been abused, for evil, like any other element of Nature—like the atmosphere in a storm—like fire in a stack-yard—or water in an inundation. There is no element of Nature, which, in its proper place, and under due subjection to the laws of universal harmony, is not positively useful; and there is none which has not been employed, and always is employed, in some way or other, to produce evil. It would be out of all consistency if it were otherwise with religion, which is, without doubt, an elementary principle of the constitution of man.

Now, we say that religion has heretofore been cultivated upon the individual side, in such a disproportionate manner as to create social evil. Many noble and cheering truths are taught by the clergy; such as the superintendence of Divine Providence—the immortality of the soul—the earnest of this immortality, which is universally conveyed to the Christian Church, and many other churches, in the resurrection of Christ

—the propagation of Christianity by extraordinary interferences of Providence—the consolations derived from solitary reflection on the evidences of faith and hope, amid the sufferings of life, and the anticipations of death. And to religion also we may ascribe the high poetic inspiration which has been infused by this faith and hope into the language, the literature, and the philosophy of Christendom, which, though unproductive in a social or collective sense, convey much silent pleasure to individual minds when poring over pages of wrapt enthusiasm, such as Young, and Milton, and Hervey, and Watts, and Wordsworth, and a thousand other men of various shades of sentiment, who still continue to administer pleasure to the solitary student, consolation to the solitary patient, and hope to the solitary outcast, but yet produce no social good which can be directly traced to them or their works. We admit the individual advantages derived from these sources, to almost any extent which is considered reasonable by the ordinary mind of sober and religious bearing. But when we have admitted it all, we must then put our finger on the negative pole of the line, and ask for as faithful an account of the benefits derived from religion in a social sense.

It probably will be replied, that whatever improves the individual, must necessarily improve society. Now, this proposition we can only partially assent to, and, in order to illustrate it, we shall have recourse to our line once more. Let the line represent a virtuous man in

or

P. Comfort———Distress. N.

It surely will not be affirmed that the virtue will shine to equal advantage on the one side as the other. Romance writers are very fond of painting heroes in poverty, and emblazoning their virtues in rainbow colours. But we must not read history in romance. The virtuous man in easy circumstances is a peaceable, innocent member of society—a good husband, a kind parent, a just master, respected by his neighbours in life, and regretted by his friends at death. He probably lived on his money, and produced no perceptible change on the intercourse of life. The virtuous man in distress is obliged to work without remuneration; he is in business, and fails; he loses by others, and others by him. This business won't do, he tries another; he entreats a friend to assist him; he fails; again he is cheated, over-reached, and circumvented by cunning men; he has recourse to petty means of supplying daily wants; his children are hungry; his wife is pale with anxiety; his home is uncomfortable. Still he preserves his integrity; he has never voluntarily abused his trust, but he has actually subsisted on other men's property, and what does the thief do more? Moreover, he has aroused jealousy and suspicion in men's minds; he has hardened their hearts; they cannot be always losing; they resolve to look after themselves, and lest there should be some undiscovered secret, lest there should be some friend behind a cloud who would come forward and relieve him in a case of urgent necessity, they clap him into prison as a fraudulent appropriator of other men's property, and there he lies. Give him either activity or passivity, spirit or no spirit, he must necessarily create evil, if he be poor. And his children will probably

turn out thieves, because he has not the money to put the boys to a trade, and the girls are too indigent, and perhaps too plain, to be sought by industrious and thriving young men. Such men as this are never pointed out as models of virtue. Our *beau ideals* are generally gentlemen in easy circumstances; their means may be small or great, the difference matters exceedingly little for the poetry of the case; but they must not be *negociants*, they must not be busy men. They are quiet easy philosophers, book men, and closet men, and, perhaps, praying and preaching men, who take their sober walks on a morning or evening, at a regular hour, and a regular steady pace, with both hands behind their backs, and their umbrellas between them, with large goloshes to keep their feet warm, and spatterdashes to keep their legs warm, and spencers to keep their chests warm. These are the men for the biographers of virtue. The biographers are right. These are the *happiest specimens*. And what does this teach us? namely, that if society were so constituted that men could be easy in external circumstances, and have an opportunity of developing their *real being*, there would be far more innocence and virtue in the world than now, when virtue is actually driven out of a man by force, when his soul is besieged like a walled city, and in defending himself from the temptations from without, he is corrupting himself and others by the wretched manœuvres he is obliged to make in his own behalf.

Now, we would ask the religious biographer, where are his *happiest specimens* of individual religion? Not among bustling men. They are either to be found among such gentlemen and ladies as we have described, or among easy cottagers, whose notions of comfort are on a level with their station, and who feel very little of the agitation and commotion of the world of trade. Trade spoils virtue. Virtue will live with the humblest cottager, but it is hard to find it with a bargaining and scheming citizen. Ease, ease, ease of mind, in respect to bodily subsistence, is its most nutritious element. What, then, has religion done for this? What has it done to remove the complication of business, and the temptations to fraud and dishonesty, rivalry, jealousy, and strife? Nothing. It has said to men, "*be not contentious*;" and it has written poetry and preached sermons to this effect, but this poetry and these sermons have been addressed wholly to the individual. Now the individual cannot obey. The individual is obliged to cherish the evil. Every rival in trade alarms him, and forces him to adopt a new move, to invent another scheme, to put down the man that would destroy his means of subsistence. He must fight or starve, and in fighting he must hate, or he wants enthusiasm to proceed.

Preaching and moralizing are totally useless in putting down this evil. And yet we can easily imagine our old gentleman and lady, or comfortable cottager in human life, reading with rapture a sermon of an eloquent divine directed against the spirit of contention. They are quite enchanted. "Oh! how beautiful," they wonder how men can refrain from following such beautiful advice. "What a wicked world it is," (and how very comfortable their own fire-side). What a small, very small impression it would make on a London tradesman! He might probably drily answer, "I wish the eloquent divine were sentenced to keep my shop, and experience all my hopes and fears, and scheme and writhe, and torture his brain as I do, merely for a month. He would then find that although it may be easy to write and preach without personal hatred (and even the clergy know this is not very easy), it is impossible to live by an overdone trade, without a fearful violation and corruption of the social feelings." "Example is stronger than precept." This is an old proverb, but the meaning of it is little considered; a clergyman cannot show example to a tradesman; nor can a rich man show an example to a poor man. But example being an *outward* thing, and *precept* an inward thing, the meaning is, that outward forms are more effectual in producing virtue than inward admonitions. Clergymen have been dealing with inward things exclusively. Moralists have done the same. Religion, as taught by these clergymen and moralists, has been inwardly and only inwardly developed, and thus morality, which is the effect of an outward arrangement of society, never has been produced, and never will be

produced by clergymen, moralists or mystics of any description, who confine themselves to individual proselytism, and neglect the only divine method of regenerating mankind, viz., a new social organization, upon a principle of universal fraternity, in which the earth shall belong to all, and every man shall be rewarded according to his works, in which men shall not act individually for individual gain, but in large social masses for universal good, and every genus and species of talent obtain free scope for the development of its native powers, which are now buried and lost by the dead weight of selfishness, which is kept on by the solemn mockery of *individual religion*.

Whatever good *individual religion* may do in a private capacity, which is its own peculiar province, it is not calculated to work beneficially on large masses, as long as it upholds the present system of trade and commerce, and political economy. Its good effects are petty at present, while negatively it is the cause of ineffable mischief, by associating, in the public mind, the idea of passivity with true religion. People will tell us that the clergy ought not to interfere with politics; because religion has nothing to do with this world! *that is*, it is an unsocial principle; for whatever is social has to do with this world, and there is nothing more truly political than social religion. In what has this notion originated? In the prevailing heresy of individual religion, which regards individual faith as all that is necessary to constitute the Christian, whilst it leaves to the Devil, the God of this world, the social organization of society, which renders all this faith and all this private piety and mysticism of no practical utility; nay, which creates temptations and schools of vice, which destroy all faith and all morality, and demonize a large and increasing proportion of our fellow creatures.

The criminal statistics of the country, although as yet not much to be depended on, are sufficiently appalling, but the 20,000 nominal offenders committed annually for trial at our criminal courts, are but a small fraction of our degenerate population. The worst crimes are those whose perpetrators are never committed. Direct theft is not so injurious to society as fraudulency and deception in trade. Theft is merely a natural reaction of poverty against riches. If you accumulate too much power at the one end of the line, you cause a vacuum or suction at the other. Theft is merely a suction produced by this vacuum. If the pump had no vacuum it could not draw water, and if the property system had no vacuum there would be no theft. The cases are perfectly analogous. It is not the thief who steals, it is the man of property, he who causes the vacuum which creates the suction; he is the thief positive, the other is merely his objective counterpart, who finishes the work which his master has begun, and is punished for his pains. How is it possible to prevent theft by punishment or counsel? We have seen many poor children craving bread in the streets, we have watched them and seen them meet with repeated rebuffs; they have told us they had no home, they lay in cellars or sheds, or on stairs, or where they could find a shelter, and at last, no doubt, were taken before a criminal court, and sent to the colony of incurables, after a solemn sermon from a judge, who affects the morality of the church, and the philosophers. What can these poor creatures do? They actually save their lives by stealing; they are Calvin's reprobates—doomed to their fate. But who dooms them? The pious religionists and moralists, who teach individual religion only, and neglect to combine it with social or political religion, which is the only method of preventing crime, by associating all the members of the state in one compact fellowship; from which each shall derive a motive for honourable exertion. In this respect religion has been fearfully deficient. In this respect religion has proved a curse to society. It has not only neglected its duty, but by neglecting it, has positively aggravated the evils which it has professed, and been paid, to cure.

It is now worse than ever. There was a noble spirit of generosity, encouraged by the Catholic church of old, in the distribution of individual wealth amongst large communities of both sexes, and in alms for the poor, and there was also a spirit of self denial, encouraged to a large extent, and still much cultivated, by the Catholic priesthood, which, however wild and unavailing in its exercise, seemed evidently to flow from

sincerity of purpose, and certainly inspired the public mind with generous ideas, of which the sacrifices made by the rich and the great for the crusades, the revival of the arts, and the endowment of public institutions bear ample testimony. But, in our Protestant times, the spirit of selfishness has been nurtured to an unprecedented extreme, and by way of separating themselves from the abuses of Popery, they have made a direct appeal to the spirit of private gathering and hoarding, and inculcated upon their disciples, the virtue of saving and collecting, and appropriating wealth as the sure road to respectability in this world, and a glorious salvation in the next. The Bishop of Salisbury, has even shown how a poor man with eight shillings a week may save one at least, and amass by compound interest a handsome property of a few pounds, to build himself a cottage. In this the clergy themselves do set the example, and instead of devoting their property to public purposes, like the denounced, and idolatrous Catholics, they add house to house, and field to field, in derision of the curse which a prophet of the Lord has denounced against the unsocial act.*

Is not this wickedness? Is not man, the individual, a stranger here? The world is merely a pilgrimage for individuals; here we have no continuing city, but we seek one to come. Why, then, should we appropriate houses and fields, and other things belonging to this world? These belong to society only, which never dies. Society belongs to the world, and the world to society; but the individual is, and ought to consider himself, a foreigner. This is the gospel of Christ and his apostles. It is even the gospel originally taught in the tithe and endowment system, which gives a clergyman a life-rent in his glebe, but no hereditary title. There is no individual property acknowledged by the Gospel, all belongs to the church at large. "All things are yours, whether things in heaven, or things on earth, for ye are Christ's, and Christ is God's."

The unsocial evils above alluded to, are all occasioned by individualizing religion, by solitary enjoyment, by closet devotion, and by encouraging the heresy that this inward feeling is the fulfilment of the duty required by God of his creatures. The business of life is regarded as something alien to religion, but still compatible with it; and thus the utmost encouragement is given to private accumulation, and no effort is made to put a stop to the evil, for the pious devotees who appropriate this world's wealth are at the same time persuaded that this world and the Kingdom of God are two different things; and that poverty and misery must necessarily continue here, till it pleases God to put an end to them, and that their sole duty is merely to look after themselves and their friends, and let others do so likewise. It is therefore a mere scramble for property outwardly, and piety retires to its closet, and its books, where alone there is any enjoyment provided for it. Thus, in the midst of wealth, there is want; in the midst of refinement there is rudeness and brutality; in the midst of the palaces of pious Christians, there are thousands and tens of thousands living in dens and cellars, poisoned with the noxious atmosphere of poverty and disease; in the midst of learning there are thousands who cannot read; and in the midst of superabundance of clothing, there are hundreds of thousands covered with rags. Can individual religion ever reach these? Can they ever go to church to learn, supposing they could there be taught? Can they ever read a useful book, supposing they had tolerable education? Can they ever meditate quietly in their closets on the mercies of God and the beauties of holiness? No! no! It is a miserable delusion to expect that individual proselytism will ever save the world. It must be a grand *coup de main* which will effect the restoration of men at once. The clergy are of no use in this social sense. They are merely individualists, and having refused to preach their Master's gospel to the poor, their stewardship must depart from them, as being unprofitable servants.

We will repeat our caution to our readers by distinguishing between the individual good and the social evil which have been effected by clerical religion.

Clerical religion has done good individually by administering private spiritual consolation in distress, and in the prospect of death, and in solitary moods and conditions.

Clerical religion has done evil socially, by allying itself with the unsocial system of accumulation and covetousness, and spreading a false notion in the popular mind, that religion is compatible with the hoarding of private gains.

Politically, therefore, clerical religion has proved a curse although, during the prevalence of this curse, it has privately administered the antidote to some.

But the social evil far outweighs the private good, and the conclusion which we draw from an analysis of the subject is this, that, in respect to social doctrine—the clergy are upholding the reign of Antichrist, and are what are in Scripture called worshippers of the Beast; whilst, privately, they are worshipping Christ, and making atonement with lip service for the mischief which the selfish principle has occasioned under their sanction.

Can a man serve two masters?

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon, late Pupil of the Polytechnic School, and Engineer of Mines.

(Continued from page 125.)

MODE OF ASSOCIATION.

The process of Association consists in the formation of small bodies, as groups spontaneously united by the exercise, in labour or pleasure, of the same passion, and in the union of groups of the same genus, or of series of groups, regulated according to certain conditions; so that each series shall represent by the totality of its groups all the features of a single passion, or, if you prefer it, all the varieties of a single labour or pleasure.

The art of associating consists in knowing and directing; 1st, the internal distribution of a series and its groups, and under groups; 2nd, its external distribution, or concurrence and spontaneous co-operation with other series.

GROUPS.—Ardour, enthusiasm, according to M. Fourier, arising only from the simultaneous satisfaction of two passions at least, one sensual and one animic, it follows that no labour can be accomplished by an isolated individual. To the exercise of every function we must appoint a group more or less numerous whose members are mutually attracted by one of the four animic passions, and who moreover experience attraction towards their common occupation. Without doubt it will often happen that a harmonian* will be induced to take part with a group without having a decided taste for the employment of that group, as the simple result of some personal attachment; and, on the other hand, the love of a certain employment will enable him to overcome some peculiar aversions for individuals. In both cases the accord would be simple and imperfect. Yet, nevertheless, the result would furnish a sufficient proof of the power of the social tie. The essential condition is that the composition of the group be effected freely, "that all the parties be passionately engaged in it without having recourse to the stimulants of want, morality, reason, duty, constraint, &c."

Another condition of the formation of groups, and at the same time one of their most valuable advantages, is the *minute division of labour*. If every individual in a group were engaged in all the details of its employment, there would necessarily be many collisions amongst them. If they were all entrusted with a common charge, it would follow, what always takes place under such circumstances, that no one would take it to heart. It is well known what guarantee of its perfection arises from the division of labour, and without doubt this perfection will be great when in every work of industry, of science and the fine arts, every one having chosen his special occupation, according to his taste, will be able to depend upon enthusiastic associates, for the completion of parts for which he feels little attraction.

We have already seen what are the *passional elements* of the groups, what are their springs of action in the material and the spiritual, in fine, to what laws of *tone* and *attraction* they are subject, according as this or that passion predominates. We might yet give more interesting details upon this first element

* Isaiah, 5, 8.

* Harmony is the name Fourier has given to new social order which succeeds civilization.

of human association; but I must here confine myself to that which is necessary to give the reader a precise idea of the theory of M. Fourier.

SERIES.—"An impassioned series is the association of all the groups, each of which exercises some *species* of a passion which becomes a *generic* passion for the individuals."

Thus, for example, in industry the association of groups, which in the same *canton* (district) will cultivate different species of flowers, will form the series of florists, and to particularize them more, the whole of the groups which cultivate different varieties of the same flower will make a series.*

The formation of series has for its object the creation of active rivalries, between the groups of a species nearly related, and also of kindly correspondence and collective engagements between groups more remote.

We have seen that amongst the individuals composing the same group, sympathy and agreement are founded upon identity of passion and function. Among groups more remote, they will be founded upon *contrast*.† These two *passional* modes are equally powerful, and ought both to be employed. The value of contrast, as a source of attraction, may be easily perceived, for example, in the natural affinity which subsists between children and old people; an affinity much greater than we perceive between the middle age, and either of the two extremes. But it is not sufficient to create this double agreement of identity and contrast, we must also know how to produce emulation and rivalry, which are always the expression of a true discord.‡ These relationships are naturally established amongst employments whose importance is nearly equal. The groups, therefore, must be arranged by shades so graduated, that between two neighbouring groups the suffrages may be equal. As M. Fourier says, the employment must be distributed according to a *compact scale*,

By this organization in series, the groups then are put in *contrast* and *rivalry*, which multiplies the springs of attraction, that we have seen to be inherent in the very nature of each isolated group. The charm of soul is doubled, since to sympathy by *identity* is added sympathy by *contrast*. There is also a double pleasure of the senses, "since to the charm of *special* perfection, or excellence, to which each group raises its produce, and to the love of approbation, which is thereby gratified, is added the charm of *collective* perfection, or social luxury, which reigns in the labour and produce of the entire series." In fine, the ardour of each group is increased, and the tie of affection which binds all its members is strengthened by the desire of surpassing rival groups. We see, then, that the employment of the social system gives development to the two first distributive passions, to the *composite* (blind zeal—enthusiasm), and to the *cabalistic* (reflective zeal or intrigue). To satisfy the third, the love of change, *sickness*, labour, like pleasure, must be pursued, in SHORT AND DIVERSIFIED PERIODS (seances, sittings).

The duration of employment for a series will be generally one or two hours, never exceeding this term, except for urgent business, or exceptional labours of art or science, in which the individual has need of greater liberty. Thus, every one will be able in the course of a day to devote himself to very different occupations. Every one will be able to develop alternately his spiritual and corporeal faculties, without ever leaving to disgust or envy the time so employed. The formation of workmen into groups for the accomplishment of this one task, admits of employment in short periods, since a group of ten or twelve individuals will perform in one hour the labour which now occupies a single workman for a day. The necessity of minute division of labour in every group is thus easily perceived. It is essentially necessary, in order that every one may acquire a real skill in the different and numberless employments in which he will take part.

* Series and group correspond to genus and species.

† Here there is a decided difference between Owen and Fourier. Fourier employs all the passions; instead of destroying competition, he merely tames it, and makes it innocent.

‡ The reader must remember that good music always employs discords, but discords kept in due subjection.

The idea of labour in short sittings is very beautiful and very original. It is a remedy for a great proportion of the evils which fall upon the people. It is truly the emancipation of the working men.

In meditating on the progress of humanity, we often congratulate it on having escaped the ancient institution of *castes*. But laying aside the small number of those who enjoy the benefits of education, and a privileged condition, and considering only the mass of the people, are we then so far removed from this organization of primitive society, that it has ceased altogether to exist amongst us? A family is no longer, in its successive generations, restricted to the same profession, but the chain has been broken only at the rings which unite these generations together. It remains entire throughout the whole period which intervenes between birth and death. It there holds the man immoveable. Every man is bound for life to the same profession, to the same trade—a brutalizing condition, which makes of the most noble creature a machine to knead bread, to churn butter, or make pins' heads.

What is it that constitutes the charm of the professions which they call liberal? is it not that, in opposition to the mechanical professions, they permit and encourage the simultaneous development of all the faculties? A painter, for example, can very easily and very usefully employ himself in sculpture, architecture, music; he can devote a portion of his time to the sciences, to literature; all this is necessary to elevate his genius, and quicken and direct his inspiration. But if you shut up the artist from morning till evening in your workshops of mechanic arts, how can you help extinguishing his genius? and yet this goldsmith was perhaps a Benvenuto Cellini, this watchmaker a Breguet, this metal-weigher a Watt.

Labour in short sittings then puts an end to this vicious circle from which modern economist cannot escape. At present, the progress of industry demands the division of labour, but as the division of labour specializes more and more the employment of the workman, it leads him to brutishness, so that the progress of industry becomes incompatible with that of the industrious. I insist upon this expression of vicious circle (*cercle vicieux*), by which M. Fourier characterises all the progress of civilization, since, in fact, in the most of cases, as well as in the preceding example, civilization turns the most happy discoveries inevitably to the detriment of the working classes. Civilization, says he, creates the *elements* of happiness, but not the *happiness*.

Short sittings have not only the advantage of insuring the full development of individual faculties, but they multiply the affectionate relationships of all the associates, since the composition of the numerous groups, in which a single individual will take part, will be very different. In a word, they destroy every thing that is exclusive in collective interests. The greatest difficulty in the problem of association, namely, the due distribution of benefits, or retribution to every one, according to his works, to the mutual satisfaction of all parties, is thus solved:—If the series were not amalgamated one with the other, if all the affections and interests of an associate were connected solely with one order of labour, every one would seek the predominance of his own corporation. Hence would arise collisions without number, and equilibrium would be destroyed. I will return by and bye to the important problem of proportional distribution. Let it suffice for the moment to have pointed out the importance of the social system, which consists in the employment of different series in *contrast*, *rivalry*, and *copartnership*—(*engrenées*). These three properties of series are equally necessary to the mechanism of association, they demand the distribution of functions according to a compact scale (*en echelle compacte*), the minute division of labour and employment in short periods.

From what precedes, it appears to me that the reader must begin to perceive that the promise of making the passions of use, and of giving a free development to *passionate* attraction; that this promise, I say, is by no means presumptuous in the mouth of M. Fourier, for the employment of the series puts into play the three distributive (or neuter) passions; and these, again, each according to its individual nature, only manifest themselves by the development of the animic (or active), and

the sensitive (or passive) passions. In respect to the transformation of labour into pleasure, by a passage from unsocial and repugnant, to social and attractive industry, we will have to point out many of the secondary and very efficacious means of insuring this result; but we may already recognize the solution of this problem given in the following table, which I have borrowed from M. Fourier, and which sums up, in respect to industry, all that has now been read:—

| <i>Social Industry operates.</i> | <i>Disunited Industry operates.</i> |
|---|---|
| 1st, By the largest possible unions in every department. | 1st, By the smallest unions in works of culture and domestic economy. |
| 2d, By periods (sittings) of the shortest duration and greatest variety. | 2d, By periods of the largest duration and the greatest monotony. |
| 3d, By subdivisions the most minute, affecting a group of individuals in every shade of employment. | 3d, By the greatest complicity affecting in one individual all the shades of an employment. |
| <i>By attraction, charm.</i> | <i>By constraint, want.</i> |

One property of the series, not less valued than those which we have considered, and to which I ought henceforth to invite the particular attention of the reader, is, that by embracing in one mechanism the pleasures of consumption with the labour of production, they will immediately destroy the purely unproductive character of consumption, which has with reason been appropriated to it in modern times. This is important. It does not attempt, as is commonly said, to make commerce and industry move by the *luxury of riches*. Understand here that the more the whole association is refined in its taste, the more will its productive faculties be active and powerful. We have seen, in fact, that to produce the charm of industry, one of the first conditions to fulfil is the subdivision of every employment, on a scale of shades of close resemblance. "This is, as we have seen, the sure means of giving active development to the *cabalistic passion*, of raising every production to high perfection, of exciting an extreme ardour in labour, and a great intimacy amongst the members of each group. But this brilliant result would fail, did we not also produce a refinement of tastes amongst consumers as well as amongst producers. In this case the general perfection of art would fail for want of appreciators. The cabalistic spirit would lose its activity amongst the groups of producers and preparers (*preparateurs*), &c. To obviate this evil the social state will train children to the cabalistic spirit in three employments—consumption, preparation, and production. It will accustom them from an early age to exert their skill upon every species of food, every savour, and every accommodation. This variety of tastes, which would be very ruinous in civilization, would be economical and productive in association. It would then procure the double advantage, 1st, of exciting industrial attraction, and 2nd, of consuming and producing by means of series."—(*The New World, Nouveau Monde*, p. 35.)

LETTER FROM "A STUDENT."

SIR,—The following letter has reached me from a deep thinking friend. If you see the propriety of giving it to the public, as the offspring of a sincere mind, I should like the observation to go with it, that if the churches were given us to occupy, I cannot see the men fit to be trusted with the work of education. I can find employment for almost any number of persons of either sex who are prepared to carry into practice the principles I have endeavoured to set forth, in large buildings, obtainable at moderate rents. From actual experience now making, it is proved there is no want of discrimination on the part of parents, even the poorest. The harvest is exceeding great, but the labourers are few. This is the point where we are wanting. All the churches in the world would never give us the power to use them rightly. With the right-ended design, we should never be deficient in communicative means.

* Large masses.

You will not conclude, then, that I agree with the general bearing of the letter; quite the contrary, I would combat, if called on, almost every position. None the less I wish the writer to be heard, and think it a pity the letter should be buried in my drawer.

If indeed my friend means the real true "Church," that is indeed where we ought to be.

C. L.

To "C. L.," the writer of the articles on Education, inserted in the Shepherd.

DEAR SIR,—I like your idea of "Camp Schools," only that in this our climate, and our present state of comfort (great even for the "starving," as compared with the savage life in deserts), they could not have the effect that in time of old the self-denial of a prophet, bare-foot, stick, and sackcloth, had over wandering tribes.

You say rightly, "the lowest part of the mass is the thing to be moved." The Church, the Church is the place we want. The crown is now favourable to general and useful education.

The thing now to petition for, or rather to demand, in the name of *intellectual education*, is the free use of all churches on Sundays, which have now no congregations, and I believe there are many in the city where no mystic service is performed on Sundays. Also, the use of all other churches on the weekdays, for evening lectures, and mental training, by laymen! The Church to be had gratis. The Crown, as the head of the Church, has power to enforce the grant free of any charge; the lighting and cleaning to be defrayed by subscription of 1d. per week; many, I hope, would pay more with pleasure; for in winter the place must be made comfortable and warm for the poorest of the poor—those now stigmatised by the exclusive as the vile unwashed rabble (monsters! and they tax soap); for, as you say very truly, they are now the human beings to be moved. The rest will feel shame and remorse, and follow in the new conviction; but, in my humble opinion, should the churches be granted, and filled by the very poor and middling (who would come at first in winter merely to warm themselves), I assert that nothing but real knowledge should be spoken of, the word "God" never mentioned, or even alluded to—the priest never abused, nor praised, nor mentioned at all. Lectures on MAN, and on the UNIVERSE, as known to reason by the revelation of scientific observation and research.

The people themselves will soon find out that you speak to them of the very same things (man and the universe) as all religions do, and ever did. The people will soon make the difference also between the mystic lessons they cannot understand, and the scientific demonstrations which have the new power of awakening the intellectual faculties, while the church language by priests never addresses itself but to our instincts.

I suggest no difference of seats like friend Owen had at his meeting. Convinced am I that the fewer rich came the better for the feelings of the poor unwashed, whom we want to raise in their own estimation. Let all come in free, and seat themselves where they please. Let science and useful knowledge, and the arts, and the science of life and human wants, human feelings, human understanding and health, temperance, peace, order, and good-will, be the only subjects. No politics, no allusion to the past and present, but plain reasonings (from the facts of human nature, and of the knowledge now possessed) on what future society will be when all brains are purged of superstition.

The repeated bloody revolutions of past centuries have given us (the people) liberty of meeting to discuss, liberty of speech everywhere, and liberty of the press to diffuse. With these to start from as a basis, more bloody revolutions can only destroy the freedom already conquered from absolutism. Knowledge alone can move the people onwards. Take for motto—

IGNORANCE, the only ORIGINAL SIN from which mankind can be redeemed.

REAL KNOWLEDGE, the only means of redemption in the power of human society.

CHURCHES, the only places where all the people can be instructed, and really informed and educated together.

LAY TEACHERS (scientific lecturers), the only priests to be trusted.

Religious forms pass away.

The religious feeling progresses.

MEDIATIONS change with time, and our mystic temples are now Sanctuaries of thought and science, no more to mystify our instincts, but to convince our understandings.

What is, is what must be, because of what has been! Abuse not the aristocracy nor the clergy of the world: they have done much for mankind.

Kings have beaten down Popes.

Nobles have beaten down Kings.

Real knowledge will beat down both Kings and Nobles, unless they seat philosophy on the throne. At this very moment the crowns of England, and France, and Spain, are abandoning the churches to the people, in order to march with public feelings and opinions, and to secure themselves longer against mental progressiveness, which tolerates nothing now but what may prove of general utility. War and conquest have marked, throughout, the reign of ignorance in power. Order and peace must mark the reign of intellectual progress, by which to redeem the people from the original sin of ignorance. But for this, lay disinterested teachers, devoted to science, must have the use of all your churches.

Robert Owen has done as much as any man can do. But after his success in Manchester and the north, when persecution begins in Liverpool, he starts off to convert monarchs!! This is beyond my comprehension.

The *Shepherd* I have always said was an excellent publication, but it should be smaller in size, larger in type, much less matter in each number, price one penny or a halfpenny, and distributed as the publisher does the *Satirist*.

It is no longer the time to "lay down one's life for the sheep." Full liberty is now allowed to diffuse real knowledge, temples and teachers are the things most wanted to create, as you say, an atmosphere of thought or mind.

As there are churches in every parish, lay teachers might be appointed to move over the land, and a board of real education should appoint and pay them to do by authority what Owen, Carlyle, and Buckingham, do of their own accord, and at their own expence. This would soon be followed by Mechanics' institutions in every village, but, far greater crowds would follow and attend to education in the Church itself, than would go to other places, which a narrow and mistaken priesthood will always deery as receptacles of infidelity. (See the absurdities now published by the *Church of England Quarterly Review*.

A STUDENT.

[This letter is another specimen of the confusion of language; for though we believe that "a student's" mind is in discord with our own upon some important points, yet he has not fully expressed his own meaning, when he speaks of knowledge and science being the summum bonum. What sort of knowledge does he mean? Does he mean to affirm that a philosopher in a laboratory or a scientific meeting, is happier than a school-boy sitting on his heels in a country farmer's shed, before a blazing fire of dried branches and old pales, which he and his school fellows have collected, and round which the spell-bound party have religiously seated themselves, to listen to the tales of genii and fairies, goblins and kelpies, and other creatures of the mind, whose ideal image is as awfully enchanting to the charmed fancy as the reality could be to the bodily vision? Then we deny the assertion. We deny the possibility of creating high enjoyment without giving considerable scope to the imagination. Reason and knowledge may be the solid earth, but imagination is the atmosphere in which we live, move, and have our being. Man is essentially an imaginative being. Even the materialists themselves, without knowing it, are obliged to give indulgence to this interesting and creative faculty, from which alone true knowledge in man actively proceeds. The attempt to suppress it is exceedingly fanatical—nothing more so. The laws of Nature are not to be altered to please the whim of a section. Nature has given calculation and scepticism to some, ardour, hope, and fancy to others. That the former should try to put down the latter may be natural enough, but it would be very unnatural if they should succeed. We are firmly of opinion that God has made man well, and there is no occasion

for preaching a crusade against any generic feature of human nature, but merely against a form of society, which prevents the proper development of the human being. To try to make a romp rational, is absurd—she is happier as she is; but the establishment of a system of association in which the active, the ardent, and the affectionate disposition of the romp might be used to advantage, is an object worthy of pursuit. We want a system that will develop human nature freely, as God has made it; not a system that will make artificial beings!—mere rationalists—according to the beau ideal of some mortal man, who *imagines* that judgment is better than imagination. Judgment is certainly requisite to lay a sure foundation; but the superstructure, the dwelling place is fancy,—fancy—where all the fine arts, all that is ornamental and exquisite in human nature, resides. What is the social feeling but fancy? What is affection but fancy? The genius of language has already determined this by the use of such expressions as these, "the dog has taken a fancy for the child," or "the child for the dog," or "the man for the woman, &c;" but who ever heard of knowledge being indetified with affection? It is as dry as a peat.

And, pray, why should our student have such an antipathy to clergy, and not to laymen, and yet advise us not to abuse the clergy, for they have done much good? It sounds droll to say, "We will not abuse you, gentlemen, nor call you unqualified, but we will not employ you, gentlemen, for laymen *only* are qualified." We regard this as a refinement of abuse. We think very differently. We believe laymen are unqualified, but we certainly think them entitled to a share in the government of the Church, and in this respect we cordially agree with a Student. The Church is at present a one-sided affair, a sort of trade or corporation, like the honourable company of fishmongers, or goldsmiths, or merchant tailors. We regard it in no other light at present. But the idea of intrusting the education of the people to men solely devoted to the *materialism* of thought, is to us defective. It is enough to subject the Church to the law of mutation or progression to which every other department of society is subject. This can only be done by amalgamating the laymen and the clergymen into one, making the Church consist of the universal people, and calling any man to the office of a clerical teacher who is deemed to be endowed by Nature with the requisite abilities. The clergy of God and Nature are the men for us, not the clergy of Oxford and Cambridge only, who, by virtue of a usurped power, exclude from the prosecution of the apostolical profession many highly gifted men, who would have been an honour to society, by being called to the chair of Moses and Christ.

Much of this, we believe, a Student agrees with; but the different meanings of language in individual minds lead to many seeming differences where there are none.

But we must say a word about his abandonment of the term "God!" He may just as well tell us to abandon the use of the word 'sun' or 'moon.' Moreover, it is absolutely unscientific to talk thus; not to speak of the utter explosion of Atheism from all philosophical discourse (and pray, what book was ever written which employed science to advocate an Atheistic faith?) We say, that considering the now universally acknowledged fact of the bipolar aspect of every department of Nature—it seems to us impossible to express the ideas of the mind on universal being without having *two terms*, one to express the external or objective aspect, and another the internal or subjective aspect. Every thing is so beautifully arranged upon this double principle, that we run involuntarily into double forms of expression, and cannot avoid it. God, in our idea, is the subjective Nature. Nature is the objective God. They may, for illustration, be represented thus:—Let the line represent

Universal Being.

God Nature
P. or Nature subjective. ——— or God objective, N.

What would "A Student" do with the two ideas? How would he express them? If he would abandon one of the terms, how would he supply its place? Would he confound the two ideas? If so, then where is his philosophy, his science, and his knowledge? Echo answers, "where?"

THE BLIND MAN, AND THE PARALYTIC.

A FABLE BY FLORIAN.

(Translated from the French, by V.)

If we would but mutually assist each other, the weight of our individual misfortunes would be considerably lightened; the good we do to our brothers and sisters, invariably diminishes the evils we suffer from ourselves. Confucius, in accordance with his whole doctrine, anxious to impress this truth upon the people of China, related to them the following anecdote:—

In one of the principal towns of Asia, there lived two very unfortunate men; the one was a cripple and the other blind; both were extremely poor besides; they constantly implored heaven to determine their wretched existence, but their prayer was ineffectual, they could not die. Our Paralytic stretched himself upon a miserable truckle-bed in the marketplace, he suffered, but received no commiseration, and this caused him to suffer the more.

The blind man, liable at every movement to be hurt, was without support or guide, he had not even a poor dog to love or lead him.

It happened one day that the blind man felt his way round the street where the sick man lay, for he heard his groans at a distance, and his soul was moved to compassion. Addressing himself to the unhappy man, he said "it is only the unfortunate can feel for the unfortunate; I have my sorrows, and you have yours; let us *unite* them, brother, and they will be less *insupportable* to both; alas! said the cripple, do you not know, that I can hardly put one leg before another; what benefit to either could result from *uniting* our misfortunes? What benefit, replied the blind man! listen to what I would say. Both of us together possess all the good that each of us individually is in need of; I have my legs, and you have your eyes, I can carry you, and you can be my guide; your eyes shall direct my insecure steps, and my legs in return will go where ever you please. Thus, without ever suffering our friendship to decide which of us *two* shall perform the most useful services for the other, I shall walk for you and you shall see for me.

[This fable is not a picture of society as it is, but as it should be. Nature has distributed her own gifts amongst us; she has broken her body, she has divided her mind, and given each of us a portion. No man is universally gifted. The strongest mind has a weakness, and the weakest mind has some element of strength in its constitution. The brave are sometimes timid, the timid are sometimes brave.

It is vain to attempt an enumeration of the gifts of mankind; but it is not vain to attempt to show that each man is dependent upon his own fortune or gifts, and derives little assistance from the gifts of others. The gifted man, who is poor and friendless, remains poor and friendless, and his gifts are buried in his own head, or expended in the meriment of gossip, or the chit-chat of a village ale-house. The inspiration of genius is dissipated in the wilderness of society. It is often ridiculed as madness by the ignorant, and too often leads to madness by the neglect which it experiences. How much mental power, how much happiness is destroyed by the solitariness of the individual, amid the vast assemblies of his fellow men! The blind man finds his own staff, and the lame man his own crutches, and the weak man takes to his heels, and the strong man fights for himself; and the fine man manoeuvres for his own interest; and the eloquent man enhances his own merits; and the feeble man slanders to sooth his own envy; and the rich man spends on his own fancies; and the poor man schemes and works for his own private support; and the powerful man collects the labours of all for his own private aggrandizement. Were the blind man in the fable, to carry the lame man where he wishes not to go, and the lame man with his eye sight to direct the blind man wrong, and, having gained his own *private* object, leave the blind man to find his own way alone, the picture of present society would be complete. We all help one another, the master helps the servant, and the spinner the weaver, and the weaver the spinner, the printer the bookbinder, and the writer the printer; but when the one has wrought hard for little, and the other has merely thrown his net into the sea

of popular trouble, and brought large gains into his own coffers, whilst the fishermen, who did the laborious work, are merely fed and clothed for the occasion, where is the friendly co-operation? The blind and the lame of the fable are one, and their interests are one, and their gains are equal; but here the interests are two, and the gain is on one side; the poor labourer is used for his strength, and when that fails him, he must then, like a blind or lame man alone, find his own way home.

What is the cure for this evil? The union of interests, mutual confidence, mutual dependence, social industry, accumulation for masses, and not for individuals, property for all, and not for one or a few.—minute division of labour, and universal employment, short hours of labour, long hours of recreation for the pleasures of imagination and the suppression of sensualism, annihilation of poverty, the eternal destruction of filthy streets, and dirty habitations, of bad clothes, and unclean persons, of ignorance and bad taste, of drunken habits, arising from idleness, and want of suitable amusements, &c. These are the cures.

We only want the power of externally modelling society, to effect the moral change. It is an outward act for the purpose of begetting an inward grace.]

THE SOCIETY OF FRIENDS.

THE Quakers are an interesting people. Their elementary view of religion is of a purer and more perfect kind than that of the surrounding sects of Christianity. They have in embryo the doctrine of a spiritual worship, "in the upright heart and pure." They have in embryo the idea of a social community, in the friendly aids with which they administer to each other's necessities. They have in embryo the idea of a religion of peace, in their decided reprobation of all violent species of offensive or defensive warfare. And they have in embryo the idea of a pure morality, founded upon veracity, independence, liberty, innocence, and domestic happiness. They have many exceedingly beautiful features of character; and yet there is something peculiarly deficient in their social capacity, as members of general society. They carry out the system of individualism in religion farther than any other Christian sect. They are gatherers of this world's goods—they are self-appropriators, and, according to William Howitt's own acknowledgment, they devote their whole time and attention to business, and money-making. They discourage the fine arts. They have banished music, and dancing, and painting, and sculpture, from their dwellings; they have interdicted the fancy from interfering with the arts of tailoring and dressmaking. They have introduced monotony into speech, and customs, and manners, and even into the drawl of their peculiar oratory, the sing-song of which (their only music) they have religiously preserved since the days of George Fox. They have banished novels and romances from their drawing-rooms, and give but small countenance to poetry, and that of a peculiar sectarian species. What can such people do? They engage in trade, and gather money. That's all. According to the notions of degenerate Christianity, this money-making is all right; and in the present state of society it is not wrong. But where is the spirit of Reform manifested in Quakerism? Does it teach social union, or does it teach men, each to gather for himself, and, like the Israelites, when the manna came down from heaven in the wilderness, collect more than he can make use of, so that it becomes a stink in his nostrils? The very attempt to approximate Christian community, without fairly entering it, has been injurious to Quakerism. Their numbers are still very limited, notwithstanding the inducements to join them, and they are exceedingly cautious of admitting any poor man, who might ultimately prove a burden to the society. Wealth is really a virtue amongst them, and poverty a sin, and the greatest of all pretenders to a spiritual religion are the most indefatigable gather-

* This is another beautiful type of community. The Israelites were forbidden to take more than they could make use of. If they disobeyed it stank. We have, therefore, a type of the social system at the institution of both law and gospel—Where is the antitype?

ers of material riches. There is a consistency in Jewish money hoarding, but how does it accord with a Quaker's spirituality?

The following quotations from a clever article by William Howitt, a Quaker, in the last number of *Tait's Magazine*, will confirm the above observations:—

"The friends have separated themselves from the public on many points of religious principle, and have renounced, on that ground, many of its pursuits and pleasures. They are thus become a simple and domestic people; for, having abandoned almost all the expensive habits and recreations by which their neighbours spend their time and their money, they are thrown, in a great degree, *upon business, as a mode of filling up their time*. Thence they derive as tradesmen another great advantage: they not only devote to their business a greater proportion of their time than many others, but they give it an *almost undivided attention*.

Well, then, the friends have an education that gives them activity, application, and an attachment to business; which gives confidence in their integrity, and takes out of their track of accumulation rival propensities and seductions. They must, of necessity, under these circumstances, get money; and, having got, how are they to spend it? Is it on splendid houses and equipages—on liveries and armoinal bearings—on numerous establishments—on attendance at the theatre, the opera—at races, clubs, balls, assemblies, routes—by magnificent entertainments to the titled and fashionable? Or is it on fine clothes, jewels, or the accomplishments of music, dancing, or painting—by field sports, or games of hazard? From all these they abstain on religious conviction. These could not divert them from the acquisition of wealth—these could not retard or lessen that acquisition in its course; and, wealth being once acquired, the only difficulty is to say how it shall be prevented from becoming enormous. Friends live in good houses, and have them well and even elegantly furnished; but then they indulge in none of those articles which absorb the greatest sums of money. Their dresses are simple: what can they spend on them compared to what fashionable people do? They keep no caskets of jewellery, to blaze in drawing-rooms and at levées. They have no costly pianos or harps, guitars or violins. They avoid as vanity carving and gilding, and the Baylonish glare of gaudy colours in curtains, hangings, and canopies. Seldom do satins and damasks, much less gold and silver tissues, flame on their chairs, couches, and ottomans; and, as for those glorious ornaments of walls, paintings, by masters old or new, in which lie often more capital than in the houses which hold them, or even the estates on which those houses stand—why, they have none of them—no, not even a framed engraving, in nine out of ten cases, except the West family, Penn's Treaty with the Indians, and the portrait of Thomas Clarkson. What sums do they save in what are called accomplishments—in teaching children music, singing, dancing, fencing, drawing, painting, languages, and a dozen other things, which are now drilled into the young, without the slightest regard to capacity, taste, or future requirement! What sums do they keep out of the hands of operadancers and singers, actors, musicians, drill-masters, keepers of taverns and clubs! They have one member in Parliament; but there is no chance of their being brought to spend their ten or twenty thousand pounds at an election; for they have a conscience against bribery and drunkenness, and, moreover, are not fond of turning night into day.

"The greatest danger which attends this state of things, is that of fostering a worldly spirit, and of bringing upon the possessors some of the worst evils of wealth, without its splendour and elegancies. And this is, in fact, the besetting sin of the society. Many and repeated are and have been the warnings of the yearly meeting on this subject—and which may be found duly recorded in their Book of Extracts, or, as it is now called, the Book of Advice, or the Book of Discipline—that is, the book of the laws of the Society—for friends to be moderate in their desires; to withdraw from trade, *when they have got enough*! and make way for others. But it must be confessed, that this advice is the least attended to of any. The words of Paine, though severe, were not without a good deal of justice, when he said—"They pursue money with a step as steady as time, and an appetite as keen as death." The majority of friends go on

trading to the last; and in no society is the influence of wealth more felt, or more powerfully, though silently, exerted. Is this to be wondered at, after the education now described, when the acquisition of property is necessarily looked upon as a great duty? I once saw a wealthy grocer, who was capable, not merely of keeping his carriage, but of keeping three or four, if he pleased, and with no family to provide for, busy wrapping up pounds of sugar, as if his living depended upon it. A person came in and related some foolish action of a retired tradesman. "Ah!" said the friend, "when men go out of business, they are almost sure to do some foolish thing or other." His fingers moved more nimbly, his eyes glistened with satisfaction, and the weighing of pounds of sugar evidently seemed a more meritorious deed than before."

TO CORRESPONDENTS.

We have neglected for several weeks past to do justice to the Watchman Newspaper, which is the organ of the Wesleyan Methodists, and glories in the name of Christian, to the exclusion of all Catholics, Calvinists, Lutherans, Whitfieldians, Socinians, Unitarians, Sandemanians, Glassites, Swedenborgians, Southcottians, &c. About four or five weeks ago we sent an advertisement to the Watchman office, containing the following words:—"The Shepherd, now publishing, weekly, price 1½d. The pages of the Shepherd are devoted to the demonstration of the social aspect of Christianity, the general apostacy of the Christian Church, and its reunion upon social principles." This is the advertisement. It was received by the clerk, and 5s. paid for it, but a council having sat upon it in the inner court, it was resolved to reject it; and, accordingly, when we sent to ascertain the fate of our advertisement, we were informed that it was rejected "because it was ANTICHRISTIAN!"

We merely put this little fact on record without any comment Mayhap, in a century hence, some public writer, turning over the pages of the Shepherd in the British Museum, to trace the rise and progress of a regenerated gospel, will light upon this centennarian anecdote, and reprint it, with some striking observations, for a generation yet unborn, who will regard us in the light of heralds of the coming morn, and rejoice in the sunbeams of that light which falls upon us merely by refraction from the yet unborn sun. To that generation we appeal. To Christ, the founder of Christianity, we appeal. To his judgment seat we appeal, before which we shall be happy to meet the editor of the Watchman, and the council who rejected the advertisement, along with the conductors of the Evangelical Review, of the same pious fraternity. Till then we bid them adieu. We shall never denounce them; but, for the sake of the generation yet unborn, we shall by and bye pick out a few more specimens of the trade from the Evangelical advertisements.

In No. 6, of Vol. II., we promised to treat soon of miracles, that volume having closed suddenly and unexpectedly, we could not redeem our promise as we intended; but, in the interval of time between the 2nd and 3d volumes, we collected a number of interesting particulars, under the name of "Legends and Miracles," which we recommend to the perusal of our readers. They contain a specimen of almost every kind of miraculous phenomenon which has been recorded in the history of man, and form a very important key to the study of Psychology. The collection was not made for amusement only; although there is a sufficient fund of amusement to make it attractive to the simple mind, there is food for tough digestion, even by the most experienced adept in the occult sciences—something to puzzle the brains of the wise, as well as to arouse the attention of the foolish.

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 18, VOL. III.]

SATURDAY, OCTOBER 28, 1837.

[PRICE 1½d.]

LIKINGS AND DISLIKINGS,

OR THE

POWER OF PREJUDICE WITH REFERENCE TO ASSOCIATION.

Nor.—Be advised ;

Hent not a furnace for your foe, so hot
That it do singe yourself; we may outrun
By violent swiftness that which we run at,
And lose by over-running. Know ye not
The fire that mounts the liquor till it run o'er,
In seeming to augment it, wastes it? Be advised.
I say again there is no English soul
More stronger to direct you, than yourself;
If, with the sap of reason, you would quench,
Or but allay, the fire of passion.

Shakspeare, Henry VIII.

HATRED is most commonly used in a vicious sense, as expressive of some unjustifiable passion, and love is used in the opposite sense, as expressive of something meritorious. The reason of this is manifest; love has a tendency to tranquillize, hatred to agitate the mind. But there are many species of love which are evil, and, *vice versa*, hatreds which are truly virtuous. A man who is never angry, is a man without moral feeling; and a man who never hates is devoid of sensibility. We cannot conceive a state of being without hatred. It belongs to creation—it is a necessary ingredient in the composition of a moral being. It is one of the primitive sources of activity. Love tends to repose—hatred to active exertion. Love tends to permanency—hatred to change of condition. Hatred of evil is the primary cause of moral and intellectual progression.

It is good to hate evil.

No man, consciously or knowingly, hates good.

We hate that which we think evil to ourselves. But we are often mistaken; and here it is where the evil lies—in hating that which is really not evil, but only supposed to be evil.

The prepossessions and prejudices of party spirit are singularly strong, and as far as our own experience goes, particularly so in early life. We well remember the aversions with which we were accustomed to look upon certain religious and political parties. The detestation was mingled with a kind of religious awe and commiseration, but it was a hatred, and that so powerful as to absorb our feelings. This feeling we have entirely lost; it is only by taxing our memory that we can speak of it; but the remembrance of it enables us to judge of the acuteness of that dislike which is experienced by many towards ourselves and our readers—dislike which almost chokes utterance in some, raises the curl-of-lip contempt in others, and the pompous majesty of Pharisaic silence in many.

This passion is not confined to persons, it extends to places and things. We remember certain roads which we detested, certain parts of a road which we peculiarly longed to pass, from a sort of ill-defined antipathy. We remember an old lime tree which always occasioned sad and disagreeable recollections.

It was a solitary thing, in the midst of a barren track of rocky land, with a solitary sheep or cow occasionally grazing beside it, and a solitary cottage, and a solitary dog, and perhaps a solitary farmer, looking out upon the bleak waste, from which he dug out his yearly subsistence. It makes us sad, even now, to recall it to our remembrance. All this we once hated, and we are afraid, from the feeling even at this very moment upon us, that we hate it still.

There are certain colours in dress which we dislike, certain forms in statuary, painting, or architecture, which we abhor; certain modes of behaviour, which we cannot endure; certain vain and affected airs, which are peculiarly displeasing; and certain presumptive acts of assurance, which we abominate. We have, therefore, abundance of the thing called hatred. We hate sounds, smells, sights, tastes, and feelings—five species of sensitive hates have we, with an infinitude of variations, all combining with the moral sense, and producing moral aversion of corresponding intensity.

Is there any one of our readers who can say that he is differently constituted, that he loves every sound alike, every sight, smell, taste, and feeling alike? then we say he is the most extraordinary animal in existence. Is there a man who hates nothing, and loves every thing? No; it is an absurdity. The very being of life is bipolar. An attraction to one pole always creates a corresponding aversion to the other. Why, then, oppose hatred? Why strive to destroy it? Why not encourage it? Reader! Dost thou not know that the earth of itself is barren, or bringeth forth weeds and confusion, but when cultivated, it produceth rich and luxuriant crops, delicious fruits, and beautiful flowers? The principle of barrenness, or weed-production, therefore, is an evil, because we strive to destroy it, but yet it is the source of agricultural art, and all the pleasures derived therefrom. Agriculture, as an art, could have no existence, were it not for this fundamental vice in our mother earth. The object of agriculture is to destroy this barrenness, and tendency to confusion of produce. But agriculture never can destroy it; for even supposing it possible to cultivate every acre of dry land, the labour must be incessantly repeated from year to year, nay, almost from day to day, to prevent the fundamental vice from rearing its head too high. But with all our labour, that vice will appear, for the principle of viciousness is not destroyed, it is only kept down by the power of art, and the skill of science.

Nay, what is still more remarkable, the fundamental vice is actually increased; the power of the earth to bring forth weeds is increased by cultivation, as any farmer will speedily perceive, by suffering Mother Nature to have her own way for a year or two in his well plowed acres.

This, perhaps, will enable the reader to understand how the elementary principle of hatred in man increases in the same proportion as love.

"As much as I do Cressid love,

"So much by weight hate I her Diomed."

A civilian has many more aversions than a savage. A civilian is offended with a small musical discord which would delight the rude untilld mind of a barbarian; he is offended

with an error in grammar or pronunciation, with awkwardness of manner, with impropriety of colour in dress, with harshness of light and shade, or unchasteness of colour in painting—species of offence which a savage cannot feel because he has not been refined sufficiently to relish the corresponding opposite virtues. For the man who cannot feel the offence of want of keeping, of delicacy of tint, and of accuracy of drawing, in a picture, has not a soul to enjoy the luxury of those beauties when they are really present. It is the power of enjoyment in the one case, which gives the sensitiveness and keenness of dislike in the other. The civilian, therefore, hates more than the savage; that is, he has a greater variety of hates, and by that variety we measure the amount of his moral and intellectual refinement.

Does not this seem strange, and yet undeniably true, that as we go on towards perfection we increase the elementary principle of hatred indefinitely, and that in that increase consists our happiness? For happiness is merely a game in which we play at *bo-peep* with pain, and derive all our enjoyment from giving it the go-by. And, as a man who throws balls, and catches them successively as they fall, tossing them up in a continuous circle of motion, augments his own satisfaction, and the satisfaction of the spectators, by increasing the number of the balls, and the areas of the circles of motion; so also do men make additions to the amount of social happiness by a multiplication of the chances of receiving painful sensations, since the object of all human skill is to present those chances, and at the same time to avoid them.

So much for elementary hatred. Now let us say a little of sectarian hatred.

Although we have determined that the happiness of man is increased in proportion to the amount of his liability to hate; we have, at the same time, shown that it also consists in the suppression of that hatred; the susceptibility of offence, without the fact of offence, is the condition of a happy being. That this is not the state of sectarianism is well known. The fact of offence is unfortunately very frequent in sectarianism. It is a concert of discords. The susceptibility of offence is not great enough. Were sectarians more sensitive than they are (notwithstanding all their proneness to ignite by the slightest friction), it would be highly advantageous to their moral well-being. Their susceptibility is all developed on one side; they are not sufficiently susceptible of self-offence. We would not find fault with their tendency to feel offended with others, if they were sharp-sighted enough to perceive their own deformities. They would thus immediately commence the work of reconciliation, and as they removed offence from themselves, they would gradually see it removed in their neighbours. Let the susceptibility alone. Let it grow to infinity. It is a taste, it is refinement; but when a man is peculiarly sensible of discords in other men's music, whilst he cannot detect a single discord in his own, he has only one polar aspect of his being developed, and is a sectarian, giving offence to all, and receiving offence from all but his own sweet self.

The application of this to individual sects and parties is very easy. Their most prominent defect is a blindness to the offence of their own natures. They require a certain delicacy of treatment. They are somewhat nervous. They have their likings and dislikings, hopes and fears, and holy awe, &c. These must be indulged, and in indulging these *idiosyncracies*, they are offending other minds, who are equally entitled to respect in their likings and dislikings—and thus we stand.

How to get out of this position is the most difficult problem of life and progress. To reason each other out of it is impossible, to laugh each other out of it is equally impossible. To persecute is vain, and to wait with patience is hopeless. To attempt to associate under such circumstances is ridiculous, and

any one small party to abandon society, and endeavour to form an *imperium in imperio*, is, in our modest opinion, a bad speculation. A nation only can successfully institute a social system. If so, there is no alternative left but the propagation of the principle by individual proselytism, until some all-absorbing event in the course of Providence takes place to afford an opportunity for the realization of the idea. It is our firm conviction, built upon historical evidence, that when a social idea

has taken firm root in the mind, especially in the public mind, opportunities are speedily afforded it of receiving a material embodiment. It cannot fail of being brought to the birth when once it has been conceived and quickened into vital being.

But of all countries in the world, a Protestant country, in some respects, presents the most insuperable obstacles to a first attempt. Protestantism is a stage behind Catholicism in social feeling. The infinite number of sectarian parties in Protestant countries has created a sea of trouble and spiritual confusion. The antipathies are excessive, self-righteousness is very high, and the parties are very small. In Catholic countries it is different—there is only one Church—a Catholic feeling pervades it, a mimic sort of brotherhood is already provided, and held up to respect, in the monastic institutions, which are in this country represented to the people in the most impious light; and thus the Catholics really are so far in advance of all other parties, that in Paris, at this very day, a large community of Catholic Christian men and women is in being, formed upon a social model, and as successful as any institution of the kind can expect to be under the malefic influence of civilization.

It must, however, be small. If it be religious, it must be sectarian, and if it be irreligious, it must be sectarian, and if it be indifferent, it must be offensive.

No party can grow to nationality, and no apparent success in temporal affairs would have any persuasive effect upon religious conviction, for *old religion* is so thoroughly prepared for, and has so often succeeded in, regarding poverty and misery as virtues, that if once the torch of zeal were fairly rekindled, it is hard to divine what it might effect. One thing it might attempt, and that is rival communities; thus introducing a spirit of opposition and hatred in constitutional organization, which would be prevented by a national movement.

But how could a national movement reconcile sects, without enforcing (which is impossible) a compromise of principles?

There seems to be only one method, and that is a fundamental basis, upon which every variety of opinion might manifest itself, viz., neither an affirmative nor a negative basis, but a neutral basis, upon the principle that society has nothing to do with individual faith.

This, moreover, is not a mere expedient, but a fact. Individual religion has reference to another world. Society, as a body, has nothing to do with another world; society belongs to this world, and this world only. The individual who dies, and leaves this world, he only can have to do with another. Let him, therefore, determine his own faith; let him act upon the Protestant principle of private authority. But the Church visible, or society which dies not, let it determine what social conduct ought to be; and let it, therefore, act upon the Catholic principle of public or social authority. Thus, we may have the two churches in one, with their characteristic features; the Catholic church (the church of works) determining moral and social behaviour, and the Protestant church, each man apart, cultivating private faith, and other parties, believing or not believing, as they saw reason. A very great variety of forms, and modes of opinion, and conduct, might thus be included in a system organized upon the two fundamental pillars, formerly specified in the *Shepherd*. If ever such a system be successfully established, we know no country better circumstanced, geographically and commercially, than this, for the experiment; but, the attempt must first be made in France, before an English people can have courage to think of it. We are not presuming to stir up any enthusiasm upon the subject; we are merely analysing the prospects of futurity. And to show that we are not without the most respectable authority, in indulging in the hope above expressed, we will conclude by quoting a sentence from one of the most distinguished philosophers of Europe, M. de Forussac, in the "*Bulletin Universel des Sciences, and de l'Industrie*" (7th section, Feb., 1834):—"Unless some retrograde movement takes place in civilization we may boldly predict that if the development of the human mind and population be not arrested, the force of events must lead to the application of the idea of M. Fourier."

But all the systems are one in substance. Association is the idea, and when the time comes for its serious application, we

doubt not, that the genius of man will give a variety, and an interest to its different modes, of which, at present, we can scarcely form a phantasm.

ANALOGIES.—GEOLOGY, ASTRONOMY, AND HISTORY.

In the wood-cut which accompanies this article, we have attempted a rude outline of the analogy which exists between three sciences. We might have taken more, but we consider it necessary to avoid complexity and prolixity, both for our own sake, and the sake of our readers. The square figure represents geology—the semicircular, astronomy. The lower geological stratum is the material or mineral formation, the second is the vegetable, the third is the animal, and the fourth is the moral. This division corresponds to that in the astronomical figure—the outward circle represents the sphere of the three great planets, Uranus, Saturn, and Jupiter. The second is the sphere of the four asteroids, which, crossing each other in their orbits, are well represented in symbol by a cross. The third is the sphere of the remaining four planets, and the fourth is the Sun.

By this figure we do not mean to affirm any thing absolute respecting the priority of the vegetable to the animal creation, which, so far as geological observation has yet gone, seem to have begun together, like the branch of a tree, dividing into two; but only to assert relatively, that the vegetable is more nearly allied to the mineral, and being a lower species of organization, and necessary for the support of animal life, it seems to be the elder of the twins, by a sort of physical necessity, which we have no doubt will be more and more confirmed by future observations and discoveries.

Before the creation of vegetables, progress was wholly confined to the superposition of the different strata, one above another; when the vegetable and animal arose into being, the progress went from lower to higher species, until man was created, and then the progress commenced in a new department altogether. Man being a moral and progressive being, the progress is continued in his moral and intellectual nature. We are, therefore, not such traitors to our species, or to sound reason, as to suppose that a new race of animals superior to man* may be created, to supplant us, as we have supplanted the megatheria, and the monstrous saurians, who flourished in the days of the Titans, when father Jove himself was alarmed for the safety of his own authority. We are somewhat wiser than this, for now we see that creation is finished—finished in man, and that the work of *regeneration*, or moral and intellectual education of the rational being man, has superseded the work of primitive creation.

You may trace the progress of society in these two figures, and if you compare them with history in general, or with ecclesiastical history in particular, you will find a strict analogy. Thus the first stage of man is material, or sensual; second, mystic, or fanciful, being a feeble attempt at satisfactory knowledge. Finding this to fail, he afterwards attempts (thirdly) science; finding this still defective, he cultivates (fourthly) morality, where lies all his enjoyment.

In the history of revelation you perceive, *first*, the law; second, the cross, or the state of transition, when the Church had no political existence; third, the gospel in apostacy, or controversy, or state religion; and fourth, the grand climacteric of all religious progress, the moral realization of the promises of law and gospel. This is the Sun. Hence in the beautiful and luxuriant imagery of primitive mysticism, the millennial age is called the Sun of Righteousness, which arises on the mind with *healing* on his wings.

A sun and a planet are two extreme opposites, or poles, and belong to two ends of a magnetic line, thus,

P. Sun ————— Planet. N.

A planet is by nature opaque, it has no light in itself; it is always one half in darkness, and light and darkness, or good and evil, alternate on all parts of its surface. A sun is the opposite. It is in the system the emblem of moral and intellectual perfection. It is unity, and light, and power. So also is a moral government in the history of society. God's government is called a moral government, to denote its perfection; and what else is a social system, in which full scope is given to the development of human nature, by the suppression of all private appropriation and physical oppression? It is the opposite pole of that species of government which has hitherto prevailed, and may with great propriety be called Solar, in opposition to that planetary or wandering form, which now blights the happiness of mankind. The progress of man in moral intelligence is therefore figuratively depicted before us in the mystic emblems of Nature; and as Nature prophecies in all her other works—as, for instance, when she makes eyes, ears, and mouth for a child, long before it has the slightest occasion for them—so also in the great system of which we form a part, do we see our destiny distinctly pointed out in the two polar characters of animal and moral being.

Were we inclined to carry out this analogy still farther, we would say, that the large division, containing the three planets, is male, and the small division, with the four planets, is female. Thus man is, by nature, and revelation, and generation, prior to woman; he, in botanical language, represents the stock, and as a tree divides itself into seven parts, three permanent and four deciduous, so man is permanently a generator, but woman not. Hence the life of man divides itself into three stages, birth, puberty, and death; but the life of woman into four, birth, puberty, loss of puberty, and death. Thus the figure corresponds with the idea of the old theologians, that the law is the male church, and the Gospel the female. Now the law consisted of seventeen precepts—the gospel of one.† These are distinctly represented in the satellites. The cross that separates them is the emblem of that discord which necessarily belongs to the planetary aspect of human society.

Should any one say that this is imaginative, we reply, that it is as clear as phrenology, or any single department of metaphysical, or even political science. Still it is imaginary, and so is moral science itself.

But the science of geology runs into this three and fourfold division in another manner than that above alluded to. It divides the formations into four, the fourth being the sphere of man and civilization. We have no animals in the first, a few inferior animals in the second, a higher order in the third, and perfection in the fourth. This division may be arbitrary, but it has certain appearances like partition walls, which commend it to the scientific world. Fourier has fixed upon the same number in his theory of the *four* movements, the fourth being the final or social movement, and even Moses, in the 4th Commandment, has conveyed the idea into the Christian world by informing us that God visits the sins of the fathers on the children unto the *third and fourth* generation. This does not imply a generation in the vulgar sense, but in the great symbolical sense which the wood-cut points out. The *four movements* are the four generations. That Moses did not mean the vulgar sense, is evident from other parts of the law, which punish offences even to the tenth generation.

* This has been hinted at by some of our metropolitan philosophers.

† Seven heads and ten horns (with the odd one)—seven precepts of Noah, and ten of Moses.

Vico, the father of modern historical analysis, has followed the same numeric order; his three periods of history being succeeded by a fourth, which is merely a revival of the first under an improved form, thus forming a continued chain like the Grecian monochord, called diatessaron, consisting of four notes, the fourth being the first of a new series; and, therefore, both fourth and first.

We are none of those who admit of the stupid idea of *chance* as a basis of philosophy. We do not know what it means. Every thing in Nature is systematic, and the organization of the whole is perfect. The Harmonicon also is perfect, which unites the parts by their respective relationships. When we discover small or obscure analogies, we attach little importance to them, merely because they are little; but when they are large and clear, we think them deserving of attention, because it is by analogies only that the universal science can be organized.

These analogies, in fine, are a higher or more interior order of facts. The mere facts of the number and size of the planets, the area of their orbits, and other isolated phenomena, are of little importance until they are collated with other facts in Nature, in order that a new species of facts not yet known may be thereby discovered. In this reproduction of a new generation of facts, we perceive the approaching era of the moralization of science, when the external facts having been sufficiently demonstrated, the genius of man will be chiefly directed to the comparison of the different departments of Nature, for the purpose of discovering the *one* law of universal harmony upon which the magnificent fabric is constructed.

The scientific movement is preparatory to the moral and spiritual movements. Science provides the material; but the material of science, as at present arranged, is, in our estimation, as inadequate to effect the regeneration of man as a huge and disorderly heap of stones, brick, mortar, and wood, for the domestic comfort of an unhoused family. The architect is yet awaiting. The arrangement of the materials is yet to be made before the heap of rubbish be entitled to the name of "sweet home."

The attempt at this universal harmony is being made in Germany, France, and Italy; but especially the two former, are eagerly engaged in the effort. In Germany it assumes the character of a mental philosophy, trying to harmonize and swallow up all philosophies. In France it assumes the character of a science, endeavouring to embrace all sciences. The St. Simonians, though now defunct as a sect, have given very general circulation to the idea and the hope. And even the new Catholic party, now forming in France, of which the Abbe de la Menais is an accomplished and eloquent representative, proceeds upon the same principle.

Science, as now cultivated, creates as much evil as it removes; there is not a new discovery of importance in mechanics which does not slay its thousands. What is the cause of this? *The sciences are not yet socialized.*

THE TRANSCENDENTALIST'S DIALOGUES.

No. XIV.

ON QUANTITY CONTINUOUS AND DISCRETE.

(Continued from p. 126.)

Transcendentalist.—Idealist.

Trans.—The idea that I said struck me at the end of our last dialogue, was Zeno's view with respect to motion. Do you remember the principle of his argument against motion?

Ideal.—No.

Trans.—The whole principle rests on the assumption that space is infinitely divisible. Let A B be a straight line, along which a body is in motion.

A ————— B

Now on the assumption that A B is infinitely divisible, it is clear that the body will successively touch an infinite number of points. To pass through an infinite number of points, will occupy an infinite time; hence, Zeno concludes, that, as an infinite number of points lies in every line, it will take an

infinite time for any body to move for ever so short a distance; in other words, that motion, notwithstanding its existence, is manifest to experience, and may, by reasoning, be proved to be impossible.

Ideal.—I see the difficulty clearly, but I do not see how it is to be removed. I move the pebble from one end of the table to the other, and see plainly enough that it is in motion, but still the argument, that there is an infinite number of points in the time of motion, proves that it does not move at all. Stay, though, I remember in one of your dialogues with the Materialist, you said that the parts of a body might only exist in *potentialia*, but not actually, until a division had really taken place.

Trans.—True, but that remark would be of no avail here; a body moving straight forwards, not only moves in a straight line, but *begets* a straight line, which is gradually increased a point at a time. Take a button, hang it on a string, and whirl it rapidly round, you will find that it begets a circle; that it actually, to your very view, begets the circle. Here the part precedes the whole, evidently passes through an infinite number of points, and therefore performs an infinite journey in a finite time. This is a contradiction in terms, and yet it is evidently and indubitably true.

Ideal.—I see before me an important matter for consideration; when I shoot this marble across the table I see a straight line produced, or rather a cylinder, the circumference of which is the same as the circumference* of the marble. But I am not sure that it does pass through an infinite number of points. Does it not rather appear that the points are but the ball itself in different positions, and that, supposing the line is six times the length of the diameter of the wall, the wall will have been only in six different situations; consequently, that the points passed through, will not only be finite but few in number.

Trans.—Yours is a natural mistake, and one that will finish on a slight investigation. Let us suppose, as you say, a ball of one inch in diameter, shot through a distance of six inches, of course the cylinder will likewise be six inches in length; but as you say that the ball will only occupy six several situations, it follows that the same effect will be produced by six balls placed in a line.

AB
○○○○○○

This figure is no solid, but a succession of solids; on the contrary, the solid produced by the motion of a ball is really a continuous solid; dim, indeed, but still cylindrical in the strict geometrical sense; thus:—

In the upper figure there are interstices between the balls, in the latter there are no interstices, every thing is filled up; and hence it follows that the cylinder produced by the motion of a ball in a line six times its own diameter is of larger dimensions than that ball multiplied by six. The images of the ball, as it were, melt into one another, so as to produce a continuity, and hence if we conceive the upper figure, instead of being six balls, to be one in six positions, there is an infinite number of positions between that at A and that at B, which are requisite, that the external points of the balls may, by their motion, fill up the interstices.

Ideal.—I see my mistake clearly enough, and that the size of body has nothing to do with the number of positions required in the generation of a continuity.

Trans.—And now we come to the great gulf between quantities continuous and discrete. A quantity discrete is that whose division is supposed to be finite, a quantity continuous that whose division is supposed to be infinite. Then twelve halfpence are a quantity discrete; assuming the halfpenny to be an unity, you can only perform division eleven times. Observe, also, your division proceeds at stated intervals, and not continuously; if you take off five halfpence, the nearest divi-

* The experiment is the same as that of spinning a halfpenny when a sphere is produced.—T.

sion you can make is by taking six halfpence; there is no medium between five and six. But let us take a line, however short it may be, and we shall find that we can divide it an infinite number of ways, and that there are no two such points to be taken that we cannot perform an act of division between them. The same may be said of superficies and solids. While we call a small portion of extension unity, of course we treat quantity continuous in the same manner as quantity discrete. Thus, if we consider the foot as twelve inches, and do not allow ourselves to divide any one inch, of course our division will be finite. But then the inch itself is a continuous quantity, and to say that a foot is made up of twelve inches, is no more than to say that a number of continuous quantities will make a large one. When, however, we talk of infinite division, we mean that in dividing an extension, we shall never come to a quantity that is merely discrete and not continuous. Every part of a superficies is a superficies, and consequently divisible, as we talked about in our dialogues on the "One," and I merely revive the subject as necessary to our consideration of "motion."

Geometricians consider a point to be without magnitude, that is, having no quantity at all; but, at the same time, they assert that a point in motion will produce a line, i. e., a quantity. Now, the quantity of a point being = 0, it follows, that by a mere addition $0 + 0 + 0$, nothing can be produced but 0, hence something must be communicated by motion more than by mere addition. This will be of the greatest use in our consideration of the production of time and space by the imaging-power.

SPECIMEN OF YANKEE CHRISTIANITY.

But Horace, Sir, was delicate, was nice;
Bubo observes, he lashed no sort of vice:
Horace would say, see, Billy served the crown;
Blunt could do business—Higgins knew the town.
In Sappho, touch the failings of her sex;
In Reverend Bishops, note some small neglects;
And own the Spaniard did a waggish thing,
Who cropped our ears, and sent them to the King.

Some of our tender-hearted friends have got a notion that a Christian spirit is a soft, delicate, inoffensive spirit, and advise us, and all who seek the good of mankind, to cultivate this spirit in the meekness of wisdom. Catholics are not to be abused, Protestants not, Infidels not; and men are not to be called hypocrites. If Jesus Christ were alive, they would, no doubt, administer the same pious admonition to him; and when he exclaimed "Scribes and Pharisees, hypocrites, generation of vipers," &c., would probably gently whisper in his ear, that it were vain for him to expect his gospel to succeed until he abandoned the use of such terms, which betrayed anything but a Christian spirit. We certainly think that a lavish use of such language is very feeble and inefficient, and have so far adhered to this maxim, that we do not remember a single occasion on which we have applied the names, hypocrite, liar, scoundrel, villain, or any other abusive term, to an individual or class. Our indignation must be roused to a most towering height when we suffer the appellation to appear in type, although, now and then it may, perhaps once in three months, escape from our lips; but, there are publications in London of pious pretensions, and repute, who lavish such epithets with the utmost profusion; set themselves up as judges of individual character, and, as if they had a commission from heaven as God's vicegerents and assessors, open the gates of heaven and hell to whomsoever they esteem best qualified for admission, and push them in *in solens volens* by their own special authority. Such publications are esteemed more Christian than ours. Why, reader? Because they occasionally give vent to such beautiful exclamations as these, "Blessed Jesus, how precious is thy blood! how rich the consolations of thy grace! oh, my redeemer, thou possessor of my heart, how shall I express the debt of gratitude that I owe to that unsearchable love, which has bought me, and saved me from everlasting wrath by the sufferings of the heir of the eternal God?" In the following page or column, perhaps,

you see individuals vilified and misrepresented, accused of being actuated by unchristian feelings (formerly devils, but Christianity is changing), and distinguished by the appropriate names which are employed vulgarly as appellatives to the false profession of religion. Such writers and characters have a special authority to abuse, because they make atonement, and show their commission, by the melodious song and puritanic phraseology of the evangelical profession. We, of course, not using such language, are not permitted to vilify; nay, even a harsh word, frequently employed even in the pulpit, and by all religious and controversial writers, sounds doubly fierce in a page of the *Shepherd*, on account of that deficiency in the unction of cant, to which we have alluded.

This is a longer introduction to our article on American slavery than we intended; but as we do not intend to abuse the slave holders, we thought it right to give our readers a hint, that there is no occasion for us to abuse them, as they have taken that office from us, and amply abused themselves, as the following extracts, taken chiefly from the Reports of the American Colonization Society, and "Cox's Slavery in America," will satisfactorily demonstrate:—

"In South Carolina, if a free negro 'entertains' a runaway slave, he forfeits ten pounds, and if unable to pay the fine, which must be the case ninety-nine times in a hundred, he is to be sold as a slave for life. In 1827 a *free woman and her three children* were thus sold, for harbouring two slave children.

"In Mississippi every negro or mulatto, not being able to prove himself free, may be sold as a slave. Should the certificate of his manumission, or the evidence of his parent's freedom, be lost or stolen, he is reduced to hopeless bondage. This provision extends to most of the Slave States, and is in full operation in the district of Columbia.

"In South Carolina, any assembly of free negroes, even in the presence of white persons, 'in a confined or secret place, for the purpose of *mental instruction*,' is an unlawful assembly, and may be dispersed by a magistrate, who is authorized to inflict twenty lashes on each free negro attending the meeting.

"In the city of Savannah, *any person* who teaches a free negro to read or write incurs a penalty of thirty dollars. Of course a father may not instruct his own children.

"In Maryland, a Justice of the Peace may order a free negro's ears to be cut off for striking a *white man*. In Kentucky, for the same offence, he is to receive thirty lashes, 'well laid on.' The law of Louisiana declares 'free people of colour ought never to insult or strike *white people*, nor presume to conceive themselves equal to the whites; but, on the contrary, *they ought to yield to them on every occasion*, and never speak or answer them but with respect, under the penalty of imprisonment according to the nature of the case.'

"The corporation of Georgetown, in the district of Columbia, passed an ordinance, making it penal for any free negro to receive from the post-office, *have in his possession*, or circulate any publication or writing whatsoever of a *sedition* character.

"In North Carolina, the law prohibits a free coloured man, whatever may be his attainments or ecclesiastical authority, to preach the Gospel!

"In Georgia, a white man is liable to a fine of *five hundred dollars*, for teaching a free negro to read or write. If one free negro teach another, he is to be *fin*ed and *whipped* at the discretion of the court! Should a free negro presume to preach to, or exhort, his companions, he may be seized without warrant, and whipped thirty-nine lashes, and the same number of lashes may be applied to each one of his congregation.

"In Virginia, should free negroes or their children assemble at a school to learn reading and writing, any Justice of the Peace may dismiss the school with twenty stripes on the back of each pupil.

"In some States, free negroes may not assemble together for any purpose, to a greater number than *seven*. In North Carolina, free negroes may not trade, buy, or sell, out of the cities or towns in which they reside, under the penalty of forfeiting their goods, and receiving in lieu thereof thirty-nine lashes.

"The laws of Ohio against the free blacks are peculiarly detestable, because not originating from the fears and prejudices of slave-holders. Not only are the blacks excluded in that State from the benefit of public schools, but with a refinement of cruelty unparalleled, they are doomed to idleness and poverty, by a law which renders a white man, who employs a coloured one to labour for him one hour, liable for his support through life!

"By a late law of Maryland, a free negro coming into the State, is liable to a fine of fifty dollars for every week he remains in it. If he cannot pay the fine he is sold.

"In Louisiana, the penalty for instructing a free black in a Sunday School, is, for the first offence, five hundred dollars; for the second offence, DEATH!

"Such, in a greater or less degree, is the situation of three hundred thousand of our fellow-citizens; and the only comfort, the only consolation, the only mitigation of their sufferings, which a Society, said to be "full of benevolence and the hallowed impulses of Heaven's own mercy," proposes, or even wishes for them, is their transportation to Africa!

"Is this a harsh assertion? Let us attend to the proofs that THE SOCIETY DISCOURAGES ALL ATTEMPTS TO IMPROVE THE CONDITION OF THE FREE BLACKS.

"We have already seen, that the managers of the American Colonization Society officially declare, that, in their opinion, no human power can remove the causes which prevent the improvement and elevation of the free negroes to any considerable extent in this country; and that the New York Society, in addressing the Legislature, express their desire, that the provisions in the constitution and statute book of that State relative to the blacks, may "stand in all their rigour." The provision in the constitution here alluded to, is that recent one, which virtually deprived the blacks of the right of suffrage which the fathers of the Revolution had given them, by requiring a freehold qualification. In the Convention by which the new constitution was formed, many of the most distinguished citizens and able lawyers, including Rufus King and Chancellor Kent, had protested against this proscription as unjust and anti-republican; but the Colonization Society are free from scruples of this sort in relation to men with black skins, and they declare to the Legislature, without whose consent this provision in the constitution cannot be changed, that they wish it to stand in all its rigour. But not contented with giving their sanction to past acts of injustice, the Society use their influence with the Legislature to prevent its benevolent operation in future. Their Memorial proceeds:—"Persuaded that their condition here is not susceptible of a radical and permanent improvement, we would deprecate any legislation that should encourage the vain and injurious hope of it."

"The Connecticut Colonization Society, in their address already quoted, denies that even "religion itself" can subdue the prejudices existing against these people. The same address authoritatively decides, that the free blacks "constitute a class by themselves, a class out of which no individual can be elevated."

"The Kentucky State Colonization Society, in their official address, say, "It is against this increase of coloured persons, who take but a nominal freedom, and cannot rise from their degraded condition, that this Society attempts to provide." *Af. Rep.* VI. 82.

"The people of colour must in this country remain for ages, probably for ever, a separate and distinct caste, weighed down by causes powerful, universal, inscissible, which neither legislation nor Christianity can remove."—*Af. Rep., Edit. Art.*, VII. 196.

"We have endeavoured, but in vain, to restore them (the free negroes) either to self-respect or to the respect of others. It is not our fault that we have failed. It is not theirs. It has resulted from a cause over which neither we nor they can have control."—*Speech of Rev. Dr. Nott before New York Col. Soc.*

We say that it is needless to abuse the perpetrators of such wickedness,—men who enact severe laws against the improvement of the black population, and then revile them as the very outcasts of humanity, irredeemable even by Christ himself. They

abuse themselves more effectually than we can. The last quotation is from the speech of a celebrated American clergyman! And, moreover, the Colonization Society is established upon such inoffensive principles, that, in 1834, when the Rev. Mr. Breckenridge, in a speech, insisted on the sinfulness of slavery, a lay member who was present, complained of Mr. B.'s unconstitutional conduct, and said he was strongly tempted to call him to order! How very Christian is all this meekness of wisdom!

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon, late Pupil of the Polytechnic School, and Engineer of Mines.

(Continued from page 133.)

Thus in the theory of M. Fourier, the well-being of the people is not only the result, but the first condition, of association. It cannot associate men, but by procuring them riches and happiness.

One word more on the employment of the series. M. Fourier frequently insists upon this, that the process of association has in it nothing arbitrary. It is the alliance of humanity with Nature; since in Nature all beings of one kind are arranged in series, graduated and contrasted. The musical gamut presents a scale of sounds so disposed, that there is a discord between sounds that are proximate to each other, but concord between those placed at certain intervals. The analysis of light, also, presents a scale of graduated shades. In fine, the classification by series of genus, species, and varieties, is the uniform method of Naturalists. Indeed, the scientific world wants a standard for this classification, this formation of series. Thus, for example, a celebrated physician has given a remarkable classification of the elementary bodies of chemistry, but this classification does not correspond in strict analogy with other natural classifications.

M. Fourier regards *universal analogy* as the absolute standard; but, according to him, the first movement to study is the *social movement*. As soon, in fact, as humanity is organised according to providential views,* as soon as it has entered into harmony, the mechanism of human association will become a faithful mirror of universal mechanism. The theory of association, considered in a philosophical point of view, is then the *supreme science*, opening the way to all other sciences. When we thoroughly understand the combinations of all the elementary groups of human association, their harmonies, their numbers, we will then be able also to explain combinations, harmonies, and numbers, in every kind of phenomena. Then science, as well as industry, will have lost its repugnant character. It will be full of charms and attractions for persons who, in the present state, appear to have the least appetite for it, (such as women and children), because they will see in all the productions of Nature symbolical images of life, and of all human passions. Then, in fine, will be raised that majestic edifice of science, that *organic encyclopedia*, for which the famous motto, "*tantum series juncturaque pollet*!"† will not be a bitter derision.

It is thus that M. Fourier views the scientific question. The title of his first publication (1806) sufficiently indicates the height of his pretensions in this respect. When he announces the theory of the *social movement*, he announces also the theory of other movements (such as the *material*, or *planetary*, that is to say, the distribution of satellites, the order and number of planets, &c., the *organic*, or the law of the distribution of organs to vegetables and animals; the *instinctual*, or the law of the distribution of instincts and passions.) The work of 1822 gives, upon all these subjects, brilliant information. Unfortunately, M. Fourier, not having made known his rules of analogy, the value of his conclusions cannot be appreciated. That which appears at least well established, and beyond a doubt, is the truth of what I have just said, that with

* According to the final design of Providence—*Providus* for all.

† A motto taken from Horace, meaning, "Combination and union only can prevail."

him the social process, the employment of series, has nothing arbitrary. It is not a simple production of the imagination—it is a genuine discovery.

I have endeavoured in this first article to give an outline of the social science of M. Fourier. In the following I will address myself to its principal applications. Permit me, in the meanwhile, to add some useful reflections upon that which precedes.

The principal work of M. Fourier (the *Treatise of Domestic Agricultural Association*) is arranged after a method altogether unusual; since this method is itself an application of the discovery, an example of arrangement by series. This circumstance, added to the abundance and variety, truly marvellous, of its practical details, renders the study of it rather difficult; and, in a first reading, causes one to lose sight of the chain of ideas, and the unity of system. It is impossible, however, when once we have made a serious examination of this theory not to recognize an order strictly logical.

Since, in every investigation, it is admitted as a principle that we ought to proceed from the simple to the compound, is it not evident, that after having proclaimed impassioned attraction as the permanent revelation of social and individual destiny, after having completely renewed the basis of morality, politics, and religion, the first thing to do in the science, which has for its object the association of men, is to unveil the nature of the individual, to analyse his passions, and, above all, to determine, with care, the relationship which ought to subsist between them, lest, in the free scope which will be afforded them, those which particularly characterize humanity, be not subdued by those which are common to animality?

After this first step, would it not be necessary to study the properties and laws of formation, of the first elements of association, that is to say, of groups which tend to form *animic* passions, then to learn to combine, to classify, these first elements, to form the series or elements of the second order?

And, as a series embraces all the labours or pleasures of one kind; as by the nature of its formation, above all, by labour in short sittings, it is susceptible of co-operation (*engrenage*) with every other series; we have here the integral element, by means of which we may form the first degree of association, the domestic association, the social household, or, to employ another expression of M. Fourier, the "*Phalange*."

And, when all the conditions of the formation of the social household have been established, when we have determined the number of individuals of which it must be composed, the surface of land which it ought to occupy, the form of its habitation, and all the mechanism of its functions of production, distribution, and consumption, we will pass to the association of *social households*, or communities of the same district, and then rise progressively to the most compound political association, the unique organization of the whole globe.

Such is the method that M. Fourier has followed. It is assuredly the most natural, and the only one which can conduct to truth. We feel that this method leaves nothing arbitrary in the disposal of power, and in the formation of the social hierarchy, since every sphere of association will be overruled by the necessity of including all the spheres of an inferior degree. If, on the contrary, we would, in the first place, and *a priori*, define the nature, the forms, the limits of power, and all the laws of political association, to descend afterwards successively through all the degrees of the social scale, even to domestic association, and the individual, it is more than probable, that in place of a doctrine of association, we would build up a doctrine of despotism and oppression—(*exploitation*).

Domestic association (or the household) and *general political association*—such are the two extreme terms which this great problem of human association presents—the solution of which was a work reserved for the nineteenth century. With which of the two terms must we approach this problem? It seems as if simple logic and all analogy pointed out the *domestic association* as the true point of departure. However, all those who, in these latter times, have proposed any new social system, appear

to have followed the contrary method.* Even those who have perceived and proclaimed the emptiness and feebleness of political theories proposed for half a century, those who acknowledge for example the necessity of substituting doctrines of order and harmony for doctrines of antagonism, have not abandoned the method of writers who preceded them. They confine themselves always to social superstructures, instead of considering the base of the edifice. All, or almost all, are more occupied with the constitutions to be given to empires, than in determining whether the present domestic system, the isolation of families, and the dissociation of industry, ought to continue.

Without doubt this prepossession of the best minds is explained by the political agitations in which we live.

We must confess, also, that in commencing, like M. Fourier, with the *household*, we find, at the beginning, questions of a character, which appear trivial to many; but those who are aware that the first wants of the people are better clothing, food, and lodging, will not forget that the highest faculty of genius, is to pass with facility from the greatest generalities to the most minute details.

* We must except Owen, in England, who has the merit of having first attempted the practical realization of association, by the formation of co-operative societies. But he had no *new social theory*.—[The above note and italics are A. T., the author's own.—Ed.]

ERRATUM.—For "determent," in page 132, middle of second column, read "detrimment."

BARON DU POTET'S LECTURES.

Is justice to the Baron Du Potet, and the subject of Animal Magnetism, we must add our own little testimony to that of others who have witnessed the operation and its interesting effects. The lectures are merely a compilation of facts and opinions, with which we have long been familiar. We expected nothing new, for nothing new can easily be adduced; and as that which is old and familiar to us, is still doubted or discredited by many loud pretenders to science, we consider it as of more importance to establish old facts than to bring forward novelties, which are sure to be treated with ridicule by those whose curiosity they stimulate.

After the lecture, the Baron magnetised three patients, a young man in good health, who volunteered himself as a subject for experiment, and two young women, who were in an unhealthy condition of body. The Baron magnetized them all at once. The ladies were speedily put to sleep, and the young man finally nodded his head, and seemed in a state of entire forgetfulness. The females, however, alone gave undeniable proofs of being asleep. We were invited to put them to the test. We and some other gentlemen accordingly rose and examined the eyes of the patients. One of the ladies kept her eyes wide open; but they were evidently not waking eyes—they were motionless; moreover, the eyelids never moved. For fully more than half an hour the eyelids remained immovable, not even a single wink was indulged in, to moisten the surface of the eye. We watched for motion till our own eyes were sore with the exertion, but we might as well have looked for animation in a carved or painted image of Madonna. This, we are certain, is more than any human effort could imitate. The Baron then showed us the influence of his manipulations; first, by agitating his patients at the distance of several paces, and then speedily restoring their tranquillity by a few gentle passes. The sobs and throes of one of the patients were sometimes very vehement, but not repulsive to the feelings; those of the other were of a less sudden and convulsive nature, and indicated no symptom of internal uneasiness, but merely a heaving, which the magnetizer created or suppressed at will, without ever touching the patient. We opened the eyelids of the girl whose eyes were closed. The eyes stared and the pupil was about double its ordinary size. This we attributed to the shutting of the eyelid, and the darkness occasioned by it; but the same effect was perceptible in the eyes of the other patient, which were incessantly exposed to light

* Phalanx, or community.

The eyes having closed, the patient complained that some one had opened her eyes. "What impudence! what right has he to open my eyes?" "What harm does it do to you?"—"It does harm to my eyes." "Do you think you are any better for the Baron's operations?"—"To be sure I am." "Will he cure you?"—"Yes!" "When?"—"A month after Christmas I shall be well." "When will you have another fit?" (epileptic)—"I don't know." "Try if you can ascertain."—"I think it will be Wednesday or Thursday week, one or other of those days; but why do you talk so? You are so inquisitive. Why don't you let me alone? I don't want to talk." "Then why do you talk; why not sit silent?"—"Because you talk to me," &c. Such is a specimen of the conversation which we and two other gentlemen promiscuously held with this young woman, who was very lively and pert; and, although half reproaching us the while, seemed very willing to prolong the conversation. After the forcible opening of the eyes, however, she cried, but a few passes of the Baron's hand within a few inches of her person restored her composure.

This is all that we ourselves witnessed at one lecture. What we heard we say nothing of; but we did not perceive in the company any one who doubted the reality of the magnetic influence. Indeed, we consider the man who could doubt, who could suspect any thing like collusion or imposture, to be more knave than fool; he must be a man of bad heart, who, rather than give credence to a singular visible phenomenon, will entertain suspicions of dishonesty in circumstances where no human power could act a deceitful part, and where, after all, nothing is to be gained by attempting an impossibility. Let any of our readers endeavour, for two minutes, to keep their eyelids motionless, with open eyes, and they may have an idea of what we consider a practical impossibility. The Baron said he could keep the eyes of his patient in that state for hours, and the difficulty he found in awakening her, confirmed the truth of his words, for, after the company had begun to disperse, and the lady was moved towards the window for cool air, the eyes remained fixed as before, and it was not till after repeated passes and blowing with his mouth, that motion was communicated to the eyelids, and then the patient awoke.

We have given a plain and unvarnished account, because we do not wish to decorate a subject of this nature. We seek plain facts ourselves, and desire to give nothing more. We are mere learners. We are not so wise as to prejudice, or refuse to go and see and determine by the evidence of the senses. We do not regard scepticism as philosophy, but as one of the obstacles to the progress of truth, and agree with Sir Thomas Brown in his book of Errors, that incredulity is as great a source of error among the learned, as credulity among the vulgar. They are two opposite species of folly, of which the world was, and still is, full. The phrenologists sadly complain of the neglect of their facts. Do they treat other facts not included in their philosophy of mind with that respect which they claim for their own? Perhaps, when they do justice, they will receive it. Till then do they deserve it? Animal Magnetism is a branch of phrenology, the neurological branch. And its facts are even more obvious to the senses than those of the formation of brains within an untransparent skull.*

[Since writing the above, we have attended another lecture, and seen the girl, Lucy Clerk, in a state of magnetic sleep. She is a mad, frolicsome creature, and would play some pretty pranks if she were let alone. She talks and laughs immoderately, but not till the Baron has opened her mouth, and magnetized her ears. She had an operation performed upon her neck, during sleep, by a surgeon, who also pricked her with a lancet on the back of the hand, to test her sensibility, but she exhibited no symptom of feeling. We did not see these operations, but several respectable and intelligent individuals, who were eye-witnesses, and with whom we conversed at the lecture, assured us of her total insensibility. We gave her one smart pinch on the fore finger, but it was as immovable as the finger of a corpse. We tried the same pinch on a stout man afterwards, who winced immediately, and declared he could not bear it.]

* It is asserted by phrenologists that the brain gives shape to

the skull; but we would ask, does the marrow give its shape to the bone? There can be no doubt that phrenology has many powerful facts to uphold it, but it is rather *too* bony.

OLD REFORMERS.

WHEN one peruses not the history of early Protestant times, but the writings of early Reformers, we discover almost all the political doctrines which now prevail amongst the populace of Europe, insisted upon with all the energy of religious zeal, and identified with Christianity itself. Popular government was once a favourite topic, even with the clergy themselves, but the fury with which party spirit manifested itself, was met with a corresponding fury on the opposite side, and the burning of heretics, slitting their noses, and cropping their ears, were regarded as criminal acts by the sufferers only, who longed to have an opportunity of retaliating in kind. Were John Knox alive in these days, he would, most probably, be engaged in writing another blast of the trumpet against female government, which he detested as unscriptural, resolved to co-operate with the curse of paradise in prolonging the subjection of woman; but John would also boldly engage with his friend Buchanan in defending the doctrine of the sovereignty of the people, for which these two worthies, amid some huge paradoxes of doctrine, fought manfully. An old writer on the vagaries of those days, whose name we know not, nor yet the date of his works, says that Buchanan "was hired to write his damned and rebellious dialogue concerning the original and rights of the Scotch monarchy, wherein he passionately, and with force of eloquence, endeavours to prove that the people may give the crown to whom they please; that, if princes do not excel in virtue they are not to be deemed kings, but should want the benefit of all human society, and if they walk not according to the laws made by the people, they are enemies to God and man, should be reckoned among wolves and other destructive beasts, deposed, judged, and executed, as other malefactors." This the writer calls a diabolical dialogue. He also calls the doctrine of popular government a monkish doctrine, because the monks were free, and might rise to the papal chair itself, which was open for all aspirants. Yet, though the germ of Universalism seems to exist in these writers, as practical men they were as tyrannical as their opponents, and they never suggested any possible mode of ruling society by a social suffrage. The people were themselves and their party, and had their own views been condemned by the majority, they would have changed their popular principles immediately.

We believe that truth may long flicker theoretically in the mind, in a phantastic or ideal character, before it assume a positive form. When it has acquired a positive form, it is practical, but till then it merely vents itself in popular clamour. It is for this reason we think our present public can never enforce any positive practical, and final good, either in Church or State. The people's principles are not positively formed; they are merely negative in their character as reformers, very good complainers and detectors of evil, but most bungling architects of a better order of external condition. In this respect, they may be said to be their own tyrants, for whenever their principles of Church and State politics are well fixed and intelligible, there can be no doubt of their success. Nothing is better calculated to fix their opinions on *externals* than to study well the social systems.

SATURDAY, NOVEMBER 4, 1837.

[PRICE 1½d.]

WHAT MIGHT RELIGION DO FOR MANKIND?

The seeds are sleeping in the soil; meanwhile
The tyrant peoples dungeons with his prey;
Pale victims on the guarded scaffold smile,
Because they cannot speak; and, day by day,
The moon of wasting science wanes away
Among her stars; and in that darkness vast
The sons of earth to their foul idols pray,
And grey priests triumph; and, like blight or blast,
A shade of selfish care o'er human looks is cast.

This is the winter of the world; and here
We die, even as the winds of autumn fade,
Expiring in the frore and foggy air.
Behold! Spring comes, tho' we must pass, who made
The promise of its birth, even as the shade,
Which from our death, as from a mountain, flings
The future, a broad sun rise; thus arrayed,
As with the plumes of over-shadowing wings,
From its dark gulph of chains, earth like an eagle springs.
—*Revolt of Islam.*

The power of religion is very great; would it were only properly directed! It raises a tribute of half a million per annum, merely to preach the gospel, and distribute tracts and Bibles amongst the heathen. It could do the same for the redemption of the poor, if the ministers of religion were so disposed.

Unfortunately, it is the tendency of preaching to spend money in an unproductive manner. The ministers and the printers receive all the money, and the people only receive the words and the paper.

We do not want a will in the people; we want only a directing power in their leaders. The people are under bad management; and just because all who have made any profession of religion have adopted the same unsocial policy, it seems now settled down into a vulgar fact, that religion is altogether spiritual, and that the teacher of religion must not employ any other means but the *pure word*. People, therefore, who acquire a little sense, and begin to think for themselves, make a laughing-stock of the priesthood, and regard it only as a discipline for children and weak-minded individuals, who are incapable of asserting their mental independence. With such views, many men of little religious feeling encourage religious missions to the very ignorant, although they would treat with sovereign contempt the proffered advice of a missionary to themselves or their families.

Many, however, are already beginning to think that external circumstances are of more avail, in a moral sense, than the moralists have hitherto preached. Several noblemen have already tried, and now powerfully recommend, the land allotment system, as a remedy for moral depravity. According to the reports of the British Association, Lord Sandon and Lord Nugent are both at present making the experiment with success; and Lord Headley, many years ago, succeeded in civilizing a race of barbarians in Glenbegh, county of Kerry,

Ireland, who have reclaimed upwards of two thousand acres of land, and raised a surplus of food, with which, in times of scarcity, they can assist their needy countrymen.

Such plans, however, we do not approve of. We think them exceedingly defective. What a waste of labour it is to employ a single individual, in an isolated condition, upon a few acres of land, without capital, without instruments, with nothing but a rude spade, a pair of brawny arms, and an inexperienced head, when agricultural science is already advanced to such a degree of perfection, that, by means of the accumulated experience of ages, the soil is improved, the crops doubled and trebled, and the labour of cultivation almost proportionably curtailed! What is the use of experience to the individual, if the experience of the species is thus to be thrown away, and men are to be sent back, like savages, to the mere guidance of instinct and brute labour in the cultivation of the ground?

What a vast difference would it make in an estate like Lord Headley's, consisting of several thousand acres, sufficient to form one of Fourier's or Owen's phalansteries, to concentrate the labours of four or five hundred men, and divide the produce according to the merits of each individual in the various departments of his employment? One hundred men might easily cultivate the whole, which is now laboured and bungled by four hundred. Each of these might have the use of half a dozen comfortable well-furnished apartments for his family, who now live stowed and huddled up in a smoky and dirty cabin. Moreover, they might, within their own family circle, provide every species of domestic convenience; they might work as carpenters, smiths, potters, tailors, shoemakers; their wives and children might be employed as cooks and housekeepers, with every comfort of domestic life, and abundance of leisure time to spare for social intercourse. The landlord might receive his present rent, the labourer more than his present reward, and a surplus of production, either in agriculture or the arts, be left to exchange for the productions of other parts of the country. All this might be done without religion; but if the spirit of religion did exist in its professed stewards and ministers, it would have been done long ago, and been now rapidly spreading over the country with success. But *well* did Christ foresee the spirit of his ministers, when he compared himself to a nobleman going into a far country, promising to return again; but after having been long absent, the servants became riotous and faithless, and did eat and drink with the drunken, thus neglecting the interest of their master's household, and studying merely their present vicious inclinations.

Christ, in mystical language, informs us how his kingdom on earth is to begin by calling his religion the gospel of glad tidings to the poor, and excluding the rich. We always consider the mystic sense of this great teacher as the safest guide for us to follow in our prospective inquiries into the future destiny of mankind. And here we have no hesitation in saying, that it is with the poor, and with the poor alone, that such a social regeneration as the one above hinted at, can commence. It is unreasonable to suppose that such large cities as London and

Glasgow, can be remodelled in one, or even two or three generations. They were last in formation, and they will be last in regeneration. It is the same with the rich, they are the last formation of the social strata, and they must be the last to receive the spirit that reintegrates the social condition.

We refer the reader to this week's portion of Fourier's social system for a clearer outline of our meaning. The phalanstere is there sufficiently described to be intelligible, and in it the possibility may be discerned of at least remodelling all our villages and hamlets, and thus saving an immense loss of labour and happiness now foolishly thrown away by the stupid system of divided industry.

We are not proposing the adoption of such a system simultaneously throughout the country, nor the substitution of such domestic establishments for the streets and squares of our overgrown metropolis. Let the rich and the metropolitans pursue their present career, but let the poor have, at least, an eligible opportunity of *benefiting one another*, by uniting their labour after the manner proposed. Surely there is nothing unreasonable in this, nothing at all calculated to alarm the wealthy, who, on the contrary, would reap additional security, and an increase of revenue.*

But where is such a system to stop, would it not finally encroach upon city life, and effect a reformation therein? assuredly it would.

Such a system would improve the morals of the country people by association, cleanliness, and variety of employment, and the effect would be a thorough cleansing of the filth of the cities and towns, where grow the seeds of every species of crime which disfigures the annals of our criminal courts. External filth is the cause of internal abomination, and *vice versa*. One half of this huge metropolis is a moral fistula. The very atmosphere of some square miles of it is fatal to virtue. Send even a philanthropist from St. James's to live for twelve months in some infested court of the eastern hamlets, and the very change of condition would cause a revolution in his moral sentiments; it would rouse his passions, irritate his temper, make him more burdensome to himself, and more intolerant to others. It would be no loss to the community if one half of London were burned, provided it were resolved that the new buildings be subjected to a strict Hygeian discipline, not of pills, but of general and regular purification, and decided cleanliness. This is a subject on which the law can with propriety exercise the severity of authority, banishing all from the city with unrelenting rigour who refused to conform to the sanitary regulations.

In this great emporium of filth and crime, the liberty of wallowing is enjoyed in full perfection. You may walk the street in any sort of attire, with a skin inch thick with mud, with clothes barked with filth, and no one has a right to say "what dost thou?" You may live in a pig-stye, if it seemeth good unto your moral and physical inclinations, or you may take bears into your parlour, and civilize them by the society of yourselves and your children. It is perfectly lawful. The police will not interfere; but if you are found drunk in the street, you are fined five shillings, or imprisoned for a day. If you want to

get drunk in a legal way, go to your pig-stye, where you are absolute master.

There is no necessity for destroying cities. But, we believe, there is a limited extent, beyond which the size of a city should not go, and that that may easily be made a matter of calculation, determined by the amount of territory under its jurisdiction, with the quantity of produce, and number of rural population. We do not admire Mr. Owen's system of uniform and everlasting parallelograms. Mr. Owen adopts this system upon economical principles. That his calculations are correct we believe. They correspond with Fourier's, and also with the calculations in Edmonds' interesting work on Practical and Political Economy. But economy, or mere saving of labour, is a miserably low standard of value. What is man, that his condition is to be estimated by the greater or less amount of labour required, to bring a cart-load of grain, or of coals, from one place to another? What, although the expense were increased ten-fold, if by that ten-fold expense, a higher moral end were to be accomplished? Cheapness and dearness are only worthy of notice when they do not enter into competition with a moral object. Neither do we consider it material, that a country should contain as many inhabitants as can possibly find support within it. There is no occasion for extremes of any kind; a dense population is as great an evil as a small population. The principal object to be pursued, is, *first*, systematic employment, and, *second*, such outward arrangements as will develop all the genius and faculties with which God has gifted the human being.

Large cities are indispensably necessary. There only can we enjoy combination in the most universal sense of the word. There only can the highest department of art be cultivated. There only can the sciences be pursued with advantage. There only can a congress of superior minds take place for intellectual and moral co-operation. There only can a centre be found, whence shall radiate, as from the sun to the planets, the highest order of intelligence. Nature itself has given us the type. The sun wheels the planets around it as the metropolis of the system. The planets wheel their satellites around them as provincial towns. This graduated scale is a law of Nature. Morality demands it. Intellect demands it. Man's love of variety demands it. The very gamut foreshows it. Every musician practises it; the orator studies it in his climax; the painter in his chiaroscuro. There must be a centre of attraction; and in that centre must be combined every species of power—to wit, size, variety, and combination, beyond that of any other place.

Now, is there anything that we have uttered contrary to religion? Is it not all in conformity with Christ's doctrine? But instead of urging the adoption of such moral means of regeneration, the religious world are merely preaching in the filthy parts of the city, and telling the people to pray, and go to church, and distributing tracts, telling them what great sinners they are, through Adam, *primarily*, and themselves *secondarily*. Moreover, their zeal has induced them to send missionaries to all parts of the world to save the heathen; while even at home in Ireland, millions of half savages, speaking the Irish language, are entirely neglected; and, although paying tithes for the support of the English hierarchy, have no Irish mission sent to enlighten them; and but a very few books, about one to every twenty families, sent to instruct them. And what is the worth of their individual proselytes, when they have found them? nervous fools. Read the *Missionary Magazine*, and see what pitiful, fearful, Devil-dreading wretches they are. "Woe! unto you, scribes and pharisees, hypocrites, for ye compass sea and land, to make one proselyte, and when ye have found him, ye make him tenfold more the child of hell than yourselves." We can expect little moral benefit from the ministers of religion; the publicans and the harlots are nearer the kingdom of God than they. They might do much good, but they will not. It is their destiny to be shunned; as it was with the reformation from Catholicism, so it must be in the reformation from Protestantism. The clergy must be convicted of religious apostacy, and enmity to the gospel of Christ.

* In recommending this mode of association, encouraged and supported by the wealth and power of the country, we must not be understood as giving encouragement to small experiments on a few acres of land, undertaken by a few zealous, but poor individuals, which must necessarily fail for want of scope and means for attaining the full stature of an industrial establishment. The first experiment must be under the control of men of capital, and of scientific skill; five hundred steady, sober, and robust men, might, we think, if intent upon such an experiment, easily procure the soil and the capital from some of the great landed proprietors, by making a few necessary concessions indispensable in the incipient state of every species of reformation. With such patronage, and under such superintendence, success is probable, and one successful experiment would in rapid succession be imitated by others. With feebleness aid than this it would be a forlorn hope. One of those concessions, we think, must be *reward according to desert*, upon Fourier's system. Equality is not a fact.

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon, late *Pupil of the Polytechnic School, and Engineer of Mines.*

(Continued from page 143.)

SECOND ARTICLE.

APPLICATION OF THE THEORY.

In concluding the preceding article, I insisted on the necessity of approaching the problem of association by the most simple term—the domestic establishment, persuaded that every other way would be at once illogical, and fatal to liberty. Moreover, M. Fourier is well aware, that, when once the destiny of humanity is clearly defined, we might advance to it, not only by the realization of a model association, which would be a proof and a guarantee of the discovery, but we might also proceed towards it slowly, and by degrees, in provoking measures of administration and general policy, proper for transforming successively, and without danger, the institutions of present society.* Under this aspect, that is to say, in respect to modes of transition, the theory of M. Fourier is not less precise, nor less fruitful in resources, than in respect to views of definite association. But M. Fourier rightly considers the possibility of a local experiment, as a proof of the superiority of his theory of universal unity. M. Fourier esteems himself a greater reformer than those who have taken that name. He thinks that the adoption of his ideas will rapidly change the face of the globe, but he does not require that people merely take him on his word. His discovery is supported by proofs extremely numerous, and much detailed, and his doctrine has no need, for its verification, of the conquest of an empire, or even of a province. It is sufficient merely to make a *district experiment*, (of about a square league, i. e. nine square miles,) which would be cultivated merely by a social domestic establishment, or industrial phalanx (community), of from 1,600 to 1,800 persons.†

The social mechanism of M. Fourier has properties so striking, so opposed to all that is known (industrial attraction, useful employment of all characters, fusion of extreme classes, passionnal equilibrium in the distribution of benefits, &c.), that its realization in an experimental district would be the most effectual method to convince the masses of the advantages of association. Moreover, such an attempt, an agricultural experiment,‡ would wound no interest, and give umbrage to nobody. The very worst of the enterprise would even be a considerable benefit for the founders, whose capital will have been employed in a work which, by the simple advantage of economy, will be eminently productive. In case of success, even though partial, the founders will have the glory of having accomplished a social work of the most excellent description. They will have demonstrated the means of extirpating universal misery, and destroyed at once every chance of a social revolution.

These considerations are powerful. M. Fourier reproduces

* M. Fourier concludes the first volume of the treatise on association by an observation, of which he thus explains the object—"In giving, during the course of this volume, outlines of the happiness of association, every one might have replied to me, that, after having acquired the habits of civilization, they could not think of such speculations, that they would rather place the free mind in circumstances the most beneficial to the mass of the people, organized as separate families and cottage agriculture, such as we have at present.

"I have, therefore, abandoned the social base, to speculate upon establishments not associate, and to examine the resources which this incoherent system can furnish for liberal truths."—(Vol. 1, p. 542.)

† There is a long note here, which will interrupt the train of thought in the text. We will reserve it for the conclusion, about two weeks hence.

‡ *Exploitation agricole*.—We are not aware that these two words can be translated into English. *Exploitation* is here used in a good sense; it is very expressive in French; it means a digging the virtue out of the earth, without injuring it. "Experiment" is very tame, but we have chosen it because it forms a synonym with "attempt."

them under all forms, and being persuaded that it is by the realization of a model association that the general movement which he foresees ought to commence, he has given, in his books, details of the estimate of expenses in preparations, buildings, purchases, &c. With the same motives I have addressed myself to the task of making known the organization and mechanism of the Social Domestic Establishment.

THE SOCIAL DOMESTIC ESTABLISHMENT.

M. Fourier explains, first, the material arrangements which will procure, to all, riches and health. We must, above all, satisfy the first want of attraction, by the creation of compound luxury, internal and external; that is to say, that he who wishes to form an association of men must know, in the first place, how to lodge, feed, and clothe them, &c. This is the natural mode. In fact, it is in the development and harmony of the passions, in an especial manner, that the wonders of association will appear to advantage. It is by this course that humanity will demonstrate the superiority of its nature, and it is in this, also, that M. Fourier perceives the object he has ultimately in view. "Our principal object in this work," he says, "is the balance of the passions. Up to the present time, the curious have been able to admire only the material excellencies of human productions. For the first time, they will behold the passionnal beauties, and declare that they have seen God in person, and in all his wisdom; for what is the spirit, the wisdom of God, unless it be the harmony of the passions, their full development, without any collision, and in perfect concord also, like that of an excellent orchestra? This beautiful result is the only one which can give to mankind an idea of the glory and the wisdom of the Deity. We now know the celestial wisdom which displays itself in the harmony of the celestial spheres, and in the mechanism of created objects, but we have no idea of political and social wisdom."—(*Treatise of Association*, vol. ii.)

This simple quotation will suffice to remove the prejudices of those who, judging hastily of a book by its title, do not feel disposed to believe that that of M. Fourier can contain any thing else than some ingenious plans of industrial organization. At all events, to restore the order of Nature, it is necessary to place humanity in circumstances the most favourable to its physical existence. In the first place, therefore, we shall occupy ourselves with its habitation.

THE PHALANSTÈRE*—the social domestic establishment—the industrial phalanx of from 1,600 to 1,800 persons, cultivating about nine square miles, occupy an edifice whose construction is not at all arbitrary—"Since there are for edifices methods adapted to each social period. Dwellings, plantations, established by a society which operates by a series of groups, ought to differ prodigiously from our villages and towns, which are adapted for families which have no social relationship, and which work in contradiction."

It would be difficult, in a simple analysis, to give a complete idea of the distribution of the *phalanstère*. What this distribution presents as most striking and original, is the establishment of a street gallery, heated or cooled according to the difference of seasons and climates. The floor of this covered street is on a level with the first story; on each side are rows of dwellings of three stories, looking on one side towards the gallery, and on the other to the country, or interior courts, laid out with agreeable plantations.

Each has his own private dwelling, proportioned to his fortune,† but all labours, interior as well as exterior, being exercised by groups, and series of groups, the edifice includes a great number of public halls, called *serietères* (for series).

The centre of the *phalanstère* is adapted for peaceable employments, for halls of repast, exchange, council, library, studios, &c. In the centre are placed the temple, the watch-

* This word corresponds to what the Owenites call a parallelogram, and residence of a community.

† Here, again, Owen and Fourier are at variance—Owen proceeding upon the doctrine of natural equality, which is a notion—Fourier upon natural inequality, which is a fact.—Ed.]

tower, the telegraph, the carrier-pigeons, the chime-bells, the observatory, &c.

One of the wings contains all the noisy workshops, as carpentry, forging, and smith work. It contains, also, all the industrial assemblages of children, who are commonly very noisy, in industry as well as in music. By this simple arrangement, we avoid a troublesome inconvenience of civilized cities, where we see, in every street, some workman with his hammer, some ironmonger, or apprentice of the clarionet, breaking the eardrums of fifty families of the neighbourhood.

The other wing contains the caravansera, with ball-rooms, halls for the reception of strangers, &c.

All the children, rich or poor, lodge in the *entresol*,* to enjoy the benefit of the services of the night guards, and because they ought, in many respects, to be separated from adults. The patriarchs lodge in the ground floor.

"The common halls do not resemble the public halls with us, where the intercourse is confused, without graduation. A hall, or repast, with us, forms only an assembly without subdivisions. The social state does not admit of this disorder. A series has always three, four, or five divisions, which occupy as many contiguous halls. Each *seristère* has apartments and cabinets attached to it for the groups and committees of each division," &c.

This detail is much more important than at first appears. It follows from this, that not only are the parties not united in series, in every exercise of labour, pleasure, or repast, &c., (except with a company of their own choice), but also that one may circumscribe his relationships as much as he pleases. You see, then, that already, that is to say, under this first view of the material arrangements, the social order respects, in the midst of association, the rights of the individual. Here the pleasures of intimacy are never compromised by the inconveniences of a crowd, any more than they are stifled by the monotony of rule. Here every one is free. Every one, in every kind of relationship, creates his own circle. You are always *passionately* attracted to take part in the labours and pleasures of some group; but if you prefer to-day to remain at home, and dine by yourself, you will find no one to rebuke you. The life of the phalanstère is, in every respect, opposed to that of a monastery; and so it ought to be, humanity having a decided aversion to monastic institutions.

Let us descend now these great stairs. Now we are within the enclosed porch. "Here is a precious luxury of which even kings are deprived, in civilization. On entering their palaces they are exposed to rain and cold; on entering the *Phalanstère*, the smallest carriage passes from covered porches to enclosed porches, heated also like the vestibules and staircases.

"A harmonian of the lowest order mounts his car, in a porch well heated and enclosed. He communicates between the palace and the stable, by a subterranean passage well ornamented and gravelled. He goes from his dwelling to the public halls and work-shops by street galleries, which are heated in winter and ventilated in summer. They can in *harmony* go through the workshops, stables, magazines, ball-rooms, refectories, assembly rooms, &c., without knowing whether it rains or blows, whether it is cold or hot; "and the details which I give on this subject," continues M. Fourier, "authorize me to say, that if the *civilised*, after three thousand years of study, have not yet learned how to lodge themselves, it is not at all surprising that they have not learned to control and harmonize their passions. When they fail in the smallest calculations of the *material*, they may well fail in the great calculation of the *passional*."

We have scarcely had a glimpse of one of the most simple marvels of the new world, and I fear that my reader is already alarmed, and wags his head with signs of incredulity, especially if he belongs to the number of those honest folks who cry out "Utopia" as soon as one announces anything new, and wishes to come out of the circle of common life. What Utopia, in fact, is greater? It treats of nothing less, than the

* Corresponding to our first floor, but raised only a little, so as to represent a floor, or apartment, between the ground floor and first floor. We have nothing like it in England.

immediate suppression of all the causes of rheums, catarrhs, inflammations of lungs &c. It treats of the means of making humanity *naturally* exempt from malady; and in this respect, surely, we are at least not inferior to the brute creation. Certainly, this is a project very cold, considering the condition in which we now are.

But this Phalanstère, it is then a palace!

Yes, I tell you, a true palace. But if this palace, which contains from three to four hundred houses, be more economical than three or four hundred houses, which now form some hideous village! or count with M. Fourier the immense saving of materials of land and hand-work, that you gain by the suppression of the inclosure walls, quick hedges, and ditches of little properties! Think, also, of the immense economy of construction, administration, and management obtained by the substitution of a single cellar, magazine, granary, and kitchen, for four hundred of each. Think that the simple fact of association would reduce to nearly one-tenth the number of individuals employed in domestic functions, and would permit the application of the surplus to other labours. Consider, also, the extreme simplification of every external relationship, such as selling and buying. After all this, you will begin to think that Fourier might have good reason for wishing to construct a palace for a domestic association.* And then, think you, seriously that the huts of Lower Brittany, or the cellars of the street of Mortellerie, in Paris, are fit habitations for men? No! it is not possible that one party can remain thus scattered in dirty cabins, isolated from all support, strangers to every social movement, as uncultivated in person as they are in intelligence; and the others have not, more than they, been made to be stowed up in infectious streets without air or light, not knowing the water and the earth, but by the dirt of their gutters. Let us, therefore, be more faithful to Providence, or rather let us be more just in our demands upon it; for the evils of humanity having been without measure, it is necessary that upon it shall at length arise the sun of brilliant prosperity. Thus, let us not repel these fine promises; let us not repel them, at least, before we have seriously examined them.

* We were informed by an intimate friend of Fourier's, that about two months ago, or more, an unknown friend had sent into Fourier's institute, in Paris, ten thousand francs, for the purpose of drawing up and publishing a perfect model of the Phalanstère.

MORALS OF THE PEOPLE.

ACCORDING to the Rev. David Ruell, the chaplain of Clerkenwell-prison, there are seven thousand prisoners annually passing under his care, and his enumeration of the original causes of the moral delinquency is as follows:—"The usual process has been impatience of parental restraint, violation of the Sabbath, and the neglect of religious ordinances; evil association, especially with abandoned females; drunkenness, arising from attending public houses, tea-gardens, &c.; petty theft, the want of character on leaving prison after the first conviction, and then a reckless course of confirmed guilt. I do not recollect a single case of capital offence, where the party has not been a Sabbath-breaker, and in many cases they have assured me, that Sabbath-breaking was the first step in the course of crime."

Now, with all due deference to Mr. Ruell, and his flock, whose opinion, however, we do not deem infallible, even when it respects their own affairs, we may remark that the above *causes* are not causes at all, but merely effects of something else. In the first place, parental restraint in itself is, we believe, very seldom the cause of moral degeneracy in the children of the poor, whose parents are notoriously lax in the moral sense of restraint; but a small house, and impatience of living stowed up in a cellar or a garret, with a drunken father and mother, and half a dozen dirty children, we believe, very frequently, drive a poor youth from home, to fill the ranks of those who are *doomed* by birth, and the unsocial system of political life, to prey upon their fellow-creatures. It is contrary

to Nature to suppose that fine moral feelings can be trained in bodily filth and want, and comfortless dwellings. There may be individual exceptions, in which the love of character, combined with other favourable circumstances, may elevate the child of extreme wretchedness above the level of his birth, and save him from the fate of his caste; but these exceptions are so very rare, that they are published as miracles when they do occur, and thus they only serve to confirm the rule above given.

The violation of the Sabbath, can never of itself be considered a cause of moral delinquency, such as that referred to; otherwise, it would produce the same effects amongst the middle and higher classes, who regard the Sabbath merely as a holiday, and spend it in what Mr. Ruell would call a profanation. The same may be said of religious ordinances, which are certainly neglected by the poor; but as frequently neglected by respectable tradespeople, by magistrates and State ministers, and other exemplary characters. These, with both rich and poor, are not causes, but effects—effects of domestic circumstances; poverty, want of education, or surplus education; want of proper clothing; want of mental tranquillity, which is necessary to indulge in religious exercises; and, moreover, want of clerical efficiency in public instruction. These are the original causes, which the poor, in most instances, have no power to remove, but are merely passive instruments of a barbarous system of the social or rather selfish policy supported by bigotry.

Why does not the State look after its own children? why not produce entertainment and tuition for the mind, and tasks for the employment of industry? Some of the finest minds in the country are, by the mere accident of birth, doomed to the lowest and most degenerate employments. State orphans, deprived of parental care, left to mere accident for support, and to the streets for a home, and to street wanderers like themselves for companions, what can they do but live like dogs, by picking up a bone or a bit of lights, when they can find an opportunity? Society has abandoned them, and they really have a *moral right*,* under such circumstances, to prey upon society. It is a dead game with them; but it is a game which is not more hazardous than one of military glory, in which the highest ranks of society rejoice to expose their valuable lives.

Providence provides for thieves as well as for *honest* tradesmen and landed gentlemen. There is an unseen hand that feeds the little orphan thief, who has no home, no father nor mother to call him son, and to supply the daily wants of that appetite which is stronger than death. He wanders about from morning till eve, craving food, and food alone. The young lions do the same; "they roar after their prey, and seek their meat from God. That thou givest them they gather; thou openest thy hand, they are filled with good. Thou hidest thy face, they are troubled; thou takest away their breath, they die, and return to their dust." But who is responsible for the little orphan's deeds? No one takes charge of him, no one provides for him, no one educates him, or trains him to honourable industry. He may be employed gathering bones, or scraping pots, for a season, kicked about and abused, for eighteen hours out of the twenty-four, for a bare subsistence, and damned as a lazy vagabond, if not always in attendance to answer the calls of an imperious master; but human nature was not born to submit tamely to such a state of being, and rather than endure

it, the best minds will boldly rebel against that society, which thus insults the spirit of industry with which every man is partially gifted by Nature, and which may be developed in all, by generous usage. We doubt not that that Divine Justice, which readily acquitted the dying thief on the cross, acquits these unfortunate plunderers of our private property, and secretly employs them as scourges of political crime, and the instruments of enforcing a more equitable system of social policy.

Drunkenness has more of the character of causality in it than any of the other causes alluded to. It is the fruitful source of innumerable crimes. It is a vice peculiarly human; no brute would ever be guilty of it. Murder is common to man and brutes—but drunkenness is exclusively human, and is, in our opinion, a more pernicious crime than murder itself. The drunkard is a slow murderer, not only of himself, but of his wife and children, and of the happiness of society, which suffers materially from every intemperate member. We do not excuse the drunkard. Every man addicted to this species of intemperance ought to be treated with the utmost severity, when other means of a more moral character have failed to reform him. But have the moral means been tried? Have the moralists clamoured against the *physical* causes of immorality, and used their influence to remove them? We have never wanted abundance of moral preachers, clerical and lay; eloquent men, who have painted vice in the most revolting colours, and have rendered her an object of abhorrence to all who listened to their impassioned homilies; but no practical means have ever been employed or recommended to remove it. We do not consider hospitals, free schools, and other charitable institutions, as practical means. These are merely monopolies in the hands of the middle classes. You may see, almost weekly, the blue-coat boys walking with their relations—the former in their antique, vulgar, and beggarly habit as paupers, the latter dressed in all the finery of fashion, and presuming to rank themselves as gentlemen and ladies! Neither do we consider workhouses as practical means, nor tread-mills, nor Sunday schools; schools of industry would be more suitable institutions, but of these we know none, and for want of these the population perisheth. Learning is but of modern growth; but industry is as old as mankind, and has always been the most effectual teacher of morality. Moreover, innocent recreation is necessary. Neither of these two necessary things are provided by the State. These are the positive preventives of crime, which are entirely neglected, and instead of them we have negative preventives—magistrates, constables, gaolers, and gaol chaplains, who cost more money to the country than the schools of industry would cost, which, being productive institutions, would more than refund their own expenditure.

The Honourable and Reverend Gerard Noel, after making a declaration similar to that of Mr. Ruell, his clerical brother, respecting the violation of the Sabbath, says, that he cannot suggest any remedy for the evil at Richmond, his residence, except that of preventing the London people from coming to Richmond on Sunday! There is no proposal made by any one to provide rational amusement for the people—to control, in a kind and indulgent manner, their inclinations, and thus direct their natural propensities into a proper channel. The sole aim of all moralists hitherto has been to do violence to Nature, and, for this very reason, Nature has wisely and justly done violence to them—and God is with Nature, and against the moralists. The fact is, that the intercourses of society are rapidly increasing, by means of mechanical inventions, and the moralists are not prepared for the new circumstances. They are employing methods which only were adapted for the infancy of society, when Richmond was a retired and sequestered little village, which cost a day's journey to visit from London, and an incalculable amount of trouble and danger; besides, no London citizen would then think of visiting it for health or pleasure, and the priest-ridden inhabitants, well worked up with the fear of God, and his sable counterpart, the opposite pole of the god-head, had nothing else to do but go to church. These were the palmy days of the clergy. They want to restore them; to put their interdicts upon steam-boats and coaches, and other inventions, for social intercourse, and thus to leave no other alternative for the poor prisoners but prayer alone! And this is mora-

* It is a state of warfare, and we do not consider thieves *en masse* as the aggressors, but merely the retaliators. It would be a most unfortunate thing for the world if all men were rendered passive and submissive to such a state of grasping and appropriation as the property system of worldly-mindedness presents. God in mercy has sent the spirit of theft to prevent the diabolical system from taking deep root in the affections of men, and for urging us all to think of a better mode of social intercourse. It is said in Scripture, that when Samson wanted thirty changes of raiment, to pay a debt of honour, the spirit of God came upon him, and he slew thirty men, and stripped them, and paid his forfeit with their old garments. The Philistines stripped Israel, and Israel stripped the Philistines. If the rich strip the poor, may not the spirit of God take revenge by giving ingenuity and protection to the plunderers of property?

lity! It is enough to cause a national rebellion against every thing that takes the name of morals and religion, and perpetrates such an act of wickedness and folly, when, by the aid of a little judicious management, and paternal care and outlay by the State, this very intercourse, so much dreaded and complained of, may be rendered instrumental in purifying the morals, and refining the manners of the population, and of working into the hands of the Church itself, if the Church really delights in the moral improvement of the people.

THE TRANSCENDENTALIST'S DIALOGUES.

No. XV.

ON MOTION.

(Continued from p. 126.)

Transcendentalist.—*Idealist.*

Trans.—Let us begin from the subject which terminated our last dialogue; namely, the generation of a line by the motion of a point. A point is supposed by geometricians to have no magnitude, and is yet supposed, by its motion, to generate a magnitude. If you doubt the existence of a point without magnitude, you may take as a subject for consideration the ball which generates the cylinder, as displayed in our last dialogue. While, however, I refer to that dialogue, I would mention, that at page 140, column 2, line 29, "ball" should be read for "wall," in two instances.

We will now inquire into motion, and the contradictions it involves.

Ideal.—I have reflected on the subject, and see clearly the difficulty; at the same time, any solution seems all but impossible. Yet, I think, I can put the difficulty in a more obvious light. Let A, B,

A ————— B

be the straight line, along which a body moving will pass an infinite number of points. Let the first of these be called *a*, the second *b*, the third *c*, and so on. Now, to pass from *a* to *b* will take one portion of time, from *b* to *c* another, from *c* to *d* a third, and so on. As the points are infinite, so also will the portions of time be infinite, and as any portion infinitely multiplied, will be an infinite quantity, so will the time occupied in passing from A to B be an infinite time.

Trans.—All this we arrived at in our last; but yet I am glad that you have set forth the matter in so full a light, as now I suspect we may be enabled to gather a profitable result. First of all, what is motion? How can a body be said to be in motion from A to B? Is a body continuing at the point A in motion?

Ideal.—Certainly not, but at rest.

Trans.—Neither is a body at the point B in motion, nor indeed at any point between the two, but at rest. When we say that a body at A can move from A to B, we imply, that although at A, it has a capacity of being at B.

Ideal.—Exactly.

Trans.—But a mere capacity of being at C does not constitute motion, for the body may, notwithstanding such capacity, remain motionless at A. Neither, if it were actually at B, would it be in motion, as we have seen. The body in a state of motion from A to B, has more than a mere capacity of being at B, and yet is not actually there. Motion, therefore, is derived from capacity and actuality,* and yet is neither. We now come to Aristotle's definition of motion:—*He ton dunamei ontois entelecheia, he toionton, kinesis estin.* "The energy of what exists in power, considered as so existing, is motion." Observe this, motion is an *energy*, and this is the medium between mere capacity and actuality. As "energy" is not a very common word, we will illustrate its meaning. Take a cake of ice, and apply heat to it, it will gradually thaw, and finally become liquid. Thus we have exhibited capacity, energy, and actuality.

* I here profess myself greatly indebted to that excellent but forgotten work, Harris's Philosophical Arrangements.

I.
The cake of ice at first has merely a *capacity* of becoming liquid.

II.
The cake of ice, while thawing, has more than a mere capacity, but is not yet actually liquid. It is *energizing* towards liquidity.

III.
When the process of thawing is over, the cake of ice is *actually* in a state of liquidity.

And now to consider the body in motion from A to B. At first, while it is at A, it has a mere *capacity* of being at B; when it is in motion it is *energizing* towards B, and at last it is actually at B. Energy means a pure state of *becoming* to be and not a state of *being* any thing. Hence, when there is any motion short of the perpetual, there must be a state of rest, a state of energy, and a second state of rest. The body, while in motion, is at no point, it has left a point, and will arrive at a point, but during the transition it is merely in the state of tending to a point.

Ideal.—Still I do not see how Zeno's contradiction is to be solved.

Trans.—Then I think I can now throw some light on the subject. Let us draw another line A, B, on which we will mark several points, C, D, E.

A C D E B
O —————

Now, let the ball at A move on to towards B, and there stop; in the whole course of its transition it is merely in a state of energy, and is not anywhere. Now observe Zeno's fallacy. He would say that a body in moving from A to B, must successively *be* at the intermediate points C, D, E, thus assuming that the body energizes first from A to C, then from C to D, and so on. But we need not admit anything of the kind; we assume that there is but one energy from A to B, and not a compound of an infinity of energies. The fact is, that the body, in moving from A to B, never is at any one of the intermediate points; these points merely seem to mark the direction of its energy. This was the way in which Aristotle would have answered Zeno. You try to prove the impossibility of motion, by assuming that a body in motion must *be* successively at an infinite number of points, whereas, the body only passes through them, without ever *being* at one of them. Your whole argument rests on the assumption that the body must be in an infinite number of situations, while, in fact, it is in no situation at all till it is at rest.

Energy is the connecting link between *being* and non-being. Let non-X afterwards be X. In the transition from one state to the other, it is neither non-X, nor X, but partaking of the nature of both, and yet neither.

We can now throw a light on the generation of a line by the motion of a point. We showed that a mere addition of 0 (the magnitude of a point) could produce nothing. Motion, however, is the transition from non-being to being, and hence will express the energizing of non-magnitude towards magnitude. Here I merely mention the geometrical point as a symbol; I am not, on this occasion, disposed to attack or defend its actual being.

I hope we shall shortly return to time and space, and our very worthy friend, the imaging-power.

TO THE EDITOR OF THE SHEPHERD.

SIR,—The following is copied from the *Monthly Magazine*, printed some years ago. I shall be glad to see it in the *Shepherd*, if you think it of sufficient importance to grace its pages. Perhaps you will give us a few Pantheistical remarks on it, as its general tenor is absolute Materialism; however, an insertion of it in the *Shepherd* will oblige your constant reader,

CHS. DYER.

8, Newman-street, Edgeware-road.

INSANITY.

Is madness a disease of the mind or the body? Of the body, doubtless. But let us get into no metaphysics, much less into

the doubts and difficulties of theology. We know nothing physically of the mind but through the body. For anything we *actually* know, the mind is the sheer result of admirable mechanism. Of the union of an independent body, and an independent mind, we know nothing. We affirm nothing, certainly, of the mind, uninfluenced by the body. We enter not into the question of materialism, it is unconnected with the view we take of the subject. We must, however, speak popularly—the mind and the body, mental disease, uncaused by external impression, is scarcely intelligible; sensations are excited from without and within, and in both may, in excess, become the cause of insanity. The process is shortly this: external impressions—in proportion, of course, to constitutional susceptibility—act, through the senses and nerves, upon the feelings, and the feelings react upon the brain. The impression is, in fact, double; first, upon the senses, next, upon the heart; almost, perhaps, quite simultaneously. The nerves and the circulation are thus both implicated; and thus, by excess of action, moral impressions, of all kinds, may become causes of insanity. But the moral is not the immediate cause—it is productive of a physical one, which is in reality the immediate—the proximate cause of derangement; and to the physical effects must we direct our main attention.

Now, these moral causes are within every body's observation, and every body can estimate the first effects. Some, without weighing the force of their expressions, have denied the influence of mind on matter; but the fact of effects upon the body—of even diseases, both of structure and function, produced by mental emotions—is established by a thousand proofs. The heart, stomach, liver, intestines, kidneys, &c., are often violently affected by the consequences of passion. The ancients referred particular passions to particular viscera—courage to the heart, anger to the liver, joy to the spleen, &c., and even modern physicians of great eminence have done nearly the same. But we have nothing to do but with recognizable facts.

Sensations, emotions, passions, are all accompanied by bodily changes; yet these are all excited by impressions from without—that is, are all instances of mind acting upon matter, before matter acts upon mind—are all moral causes.

Modesty betrays itself by a simple blush, which vanishes with the exciting cause, and scarcely produces any further perceptible effect; but shame shows a deeper suffusion—a more permanent one; the blood is, in a peculiar manner, retained in the vessels nearest the surface, as if the veins had suffered some sudden constriction, and refused to return it; this sensation, in its excesses, is known to have produced other physical effects of an extraordinary kind—suppressions, insanity, death. Esquirol, a French physician, records his attendance upon a "lady who became insane on the wedding night, from shame, on sleeping with a man; and also another, who, though she loved her husband to excess, was deranged at the nuptial approach."

Diffidence is another modification of modesty, which has brought on mental derangement. Cowper, the poet, is quoted by Dr. Burrows as an instance of *melancholy* from apprehension of inability to execute with propriety a very simple and honourable, but public duty.

Terror and horror produce similar effects; but here the face is pale—the blood is driven from the extreme vessels back upon the heart—the motions of the heart become thus embarrassed—a violent struggle ensues—and the organ may suddenly cease to beat, or may burst. In the re-action, too, the functions of the brain may be overwhelmed by the force of the blood rushing back into the vessels, and then insanity ensues.

In anger, again, the blood flies to the capillaries, and reddens the surface; but sometimes the effect is just the contrary, and the cheek is perfectly blanched; in the latter case, it is of a more deadly, though less impetuous, character, coupled, perhaps, with the chilling checks of hatred and revenge—a sudden and forcible control effected partly, perhaps, by the promise of future and more effective vent; but madness may follow, in the one case, the accelerated movement of the blood; and apoplexy, in the other, the violent reaction upon the exhausted vessels.

The effects of fear, and terror, and anger, even upon the muscular powers, are equally obvious; anger augments them prodigiously; fear, on the contrary, paralyzes; sudden alarms,

—as we learn from physicians of respectability, and we may safely trust to such facts—by their chilling effects, have removed the symptoms of incipient fever. Fear, again, may check as well as cause insanity. A pail of cold water, dashed on the patient by surprise, has been known to cure mania; but there must always be danger of the reaction destroying the equilibrium between the nerves and the circulation, and thus producing fatuity or apoplexy. Terror, again, may stimulate as well as paralyse. It will rouse to extraordinary efforts of self-preservation; but the ultimate effect may work the subversion of the mind. Dr. Burrows records the effects of terror upon a British naval officer, who had an intrigue with the wife of a native of Monte Video. Returning from an interview, in the night, he was attacked by assassins; the sudden fright and peril acting as a powerful stimulant, he defended himself so vigorously that he escaped unhurt, and took refuge in a place of safety; but scarcely had he reached it, when he was seized with furious mania; the reaction destroyed the equilibrium—the circulation had been too much quickened to calm quietly down to the point of steadiness.

The tendency of excessive grief to force blood to the brain, and, consequently, to bring on madness, is familiar to every one—tears give relief, sudden joy, again, and more likely, apparently, than grief—it has no natural vent like grief. Transitions from joy to grief occasion the greatest shocks, and produce the most durable effects. Yet actual losses, or disappointments in pecuniary speculations, do not appear, observes Dr. Burrows, to occasion insanity so frequently as unexpected or immense wealth. In the six months succeeding the numerous failures of the winter of 1825-6, there were fewer returns to the commissioners for licensing mad-houses of insane persons in the London district, than in any corresponding period for many years before.

Distinct effects, again, are produced on particular organs, by particular passions. To give an instance or two—the smell, or even the expectation of food, excites the saliva—maternal feelings the secretion of milk—dislike, both in the woman and the brute, prevents the flow of it—fear excites the intestines, kidneys, and skin, producing diarrhoea, incontinence of urine, and sweat—grief affects the stomach and lachrymal ducts—compassion, the bowels—anger, the liver—terror, the nerves, sometimes even to paralysis—extreme hope, the respiration.

And, generally, whenever strong emotion and passion stimulate the brain to extraordinary exertion, the action of the heart is responsive, and varies with the force of the impression. Joy, anger, desire, &c., accelerate the circulation, and bring on, in its excesses, mania, palsy, &c. Fear, horror, &c., on the other hand, by retarding, or rather, by reflecting back the current of the blood upon the larger vessels, produce fainting, and even absolute suspension of the action of the heart, and on the recovery of its force, so violent a reaction, that life is often extinguished in the conflict, or the intellect deranged.

Intense thought, or abstraction, has a powerful influence on the circulation. Mathematicians have been known, says Dr. Burrows, to pass days and nights without sleep, from being too deeply engaged in some intricate calculations. This absence of sleep is obviously the result of excessive action of the brain, which, if not relieved, must soon run on to delirium. Extraordinary wakefulness is the signal of Nature, therefore, for suspending such pursuits.

Other effects in abundance may be collected, not usually assigned among the results of the action of the mind upon the body, and yet as indisputably such as any that have already been noticed. Dr. Burrows marks the *charming* of warts as an instance; the rapid change of the hair to white is plainly another; the very temperature of the body is changed—lust heats—fear and aversion cools—the *mal de pays* arises from a moral source—producing, on the evidence of physicians, positive organic effects—the lungs are found adhering to the pleura, &c.

The moral causes hitherto enumerated originate in the individual; but there are others which seem to spring from the existing condition and circumstances of society. The more artificial is the state of society, the more active are such causes—the more extensively they multiply and operate. Indul-

gence, indolence, the vices of refinement, make men more susceptible and irritable—more sensitive to impressions, and, of course, more liable to insanity. Intense pursuits, of any kind, high cultivation, morals, religion, politics, produce intellectual disorders. The lower classes, too, though exempt from these concomitants of habitual luxury, and intense cultivation, provoke diseases by excesses; drunkenness and intemperance producing thus the very effect which extreme refinement and fastidiousness do among the higher—that is, greater susceptibility.

[The above quotation from the *Monthly Magazine*, we very willingly insert, at the request of our Correspondent. But we can scarcely agree with him, that the tenor of the article is absolute Materialism. We see little in it which even a disciple of Berkeley, or Malebranche, may not safely admit. Materialism denies the primary existence of mind, by asserting the primary existence of matter, and regards mind as merely a production of material combinations, not as a distinct elementary being. Spiritualism asserts the primary existence of mind, and regards matter as merely a creation of the positive mental agent which rules the universe. The article above quoted takes neither side, and it speaks so clearly of action and reaction between spiritual feelings and material instruments of feelings, that one cannot read it without thinking all the while of two polar beings, spiritual and material. Does our Correspondent imagine that the intimate connexion between mind and matter is an argument in favour of Materialism? Surely, he cannot think so. Why should it prove the being of the one pole, and not of the other? It merely proves the union. But why should the mind be injured, when the body is injured? The mind is not injured, that we know of. When the glass of a telescope is injured, we cannot see the solar spots, but our eyes are not injured: our opportunities of observation are injured. So, if a man lose his eye-sight, or hearing, his opportunities of external intercourse with the material world are curtailed. When his nerves are weakened, when his blood is overheated, the same effect follows, and the world seems to whirl round, and all its contents are presented in confusion. His instrument is destroyed; and, as a warrior, whose sword is broken, or shield is lost, must either submit, or provide himself with another, so the mind, as long as it uses the destroyed instrument, is inefficient, but inefficient only in the instrument. We can prove no more. But how can we prove, or make it appear probable, that the mind procures another instrument? In the first place, we prove that mind is positive, and matter negative. Mind, or consciousness, is unity—matter a compound. Mind is lord of matter, not matter of mind. The dissolution of elementary mind, therefore, cannot be proved; for nothing but a compound substance can dissolve. A Materialist may believe in the dissolution of mind, but that is merely a matter of faith. But mere science, that is, the anatomy or physics of the question, can never prove the immortality of the mind. It is a moral question, because it treats of a moral subject; and a well-ordered mind, who sees Nature as the magnificent fabric of an infinite wisdom and power, can have little difficulty in perceiving the almost moral certainty of an eternal prolongation of being to the creature in whom the idea and the hope of immortality has been planted. Our minds are actually made for it; and when did Nature ever commit such a blunder as to make generic provision for a condition of being which was never to be realized? Search all the animal and vegetable creation, and you find the providential and prophetic mind of the Creator anticipating the future being of the work of his admirable skill. It seems to us a pity that *liberals* should be so prone to Materialism and annihilation, &c. It has materially injured their cause hitherto; but no doubt a material good will result from it in the end; but as for their philosophy and science, they are very shallow, and are now gradually going out of repute by the tail or lower extremities of society.—Ed.]

The following sentence we quote from a work called *Church Reform*, of which we shall speak more fully hereafter:—

“These two facts—the subjugation of ignorance by religious faith, and the reluctance of that faith to take any cognizance of human progressivity, constitutes for us a most SACRED WARRANT AGAINST THE ETERNITY OF MYSTERIOUS DOGMAS,

OR SYMBOLICAL WORSHIPS. They are all by nature essentially temporary, and it is in that positive character of *real* but *evanescent* utility, that we regard them as most sublime and most admirably consistent with the natural circumstances, in which they were not only useful, but actually indispensable as a beginning.”

TO CORRESPONDENTS.

J. G—or, W. B.—We felt very much interested in the prospectus which our correspondent sent us, and think it the nearest approach to Catholicism (not Roman) in religion that we have before witnessed, under such a form as the model of an association; and nothing pleases us more in the prospectus than the subjection of the individual to the universal opinion. This is indispensable. It is the basis of Christianity. The members (not the clergy) are the Church, and the Church is the highest court of appeal. The spirit of Christ is in the whole, and by this summatism of opinion in the Church, and by this alone, can the spirit of Christ become practically useful, and reign in the world. This is what we call Universalism. Notwithstanding, we have our objections to the prospectus—objections arising from the conviction that the defects complained of will mar the success of the measure. In the first place, there is a confusion of authority. The Scriptures are called one authority, and the universal sense of the Church is another. Now, we ask the reason why the Church is not permitted, at this day, to consecrate Scriptures, as well as in the days of Constantine the Great. It is the office of the Church to declare what is, and what is not Scriptural. Why should our Church history not be a part of the Bible as well as the Church history of the Jews? If the Church cannot make holy Scriptures of equal authority with the Old and New Testament, then the spirit of God is not in the Church, and it is mere quackery to talk of it. We insist upon a plenary inspiration of the Church, for without this plenary inspiration of the Church, the plenary inspiration of the Bible is a mere fiddlestick, and you may play any tune you like with it. This, then, is our first objection.

Our second objection is, that the plan of the Association is not sufficiently defined, or, in fact, there is no plan of operation. There is an ideal good aimed at—a desirable object in view; but the method to be pursued is so imperfectly outlined, that no practical effect can follow. We do not wish to propose a plan of our own at present; we are more disposed to collate the plans of others, and give ourselves and our readers time for reflection, and to spread abroad, in our little circle, the possible idea of association. But we recommend our correspondent to read carefully the leading article of this week, and the portion of Abel Transon's exposition of Fourier's system. Perhaps he may find some hints which may be serviceable. Depend upon it that nothing but the clearest and most arithmetical mode of going to work can succeed in these scientific times.

TRANSCENDENTALIST.—Might not the Transcendentalist have refuted Zeno's fallacy by another fallacy, showing that there was no space between A and B, for, if a mathematical point is without breadth or length, an infinite number of such points is also without breadth or length? Hence the body passes from A to B in no time. Two opposite fallacies neutralizing each other, thus show the method of reasoning to be inconclusive. It is the inconclusiveness respecting Nature's mysteries that forms the basis of faith in the creature.

COMMUNITY OF PROPERTY: TO WHAT EXTENT IS IT POSSIBLE?

"And all that believed were together and had all things common. And sold their possessions and goods, and parted them to all, as every man had need. And they continuing daily with one accord in the temple, and breaking bread from house to house, did eat their meat with gladness and singleness of heart."—*Acts of the Apostles*, ii. 44.

ATTEMPTS have been made to revive the primitive Christian practice of common property, but they have always proved remarkable failures. In modern times, these attempts have generally originated with stern fanatics, destitute of common prudence, and trusting blindly to the extraordinary manifestation of the spirit, and they have always been connected with the idea, that political institutions, and magisterial authorities, were unnecessary to preserve the order and subordination of society. From the naked Anabaptist, who raved, with a drawn sword, in the streets, and proclaimed the reign of King Jesus, down to the coolest and most infidelized materialist, this notion of a system of political peace, and pure moral government, has been evidently either the cause or the effect of the doctrine of community.

The subject, however, has one very towering difficulty, viz., the marriage question. This stops all arguing with some, and thoroughly perplexes others.

Had it not been for the marriage question, community would have been established in the world long ago. The Roman Catholic Church was deeply impregnated with the idea. According to Thomas Campanella, even some of the early fathers went so far as to teach a community of wives, like Lycurgus, Socrates, Cato, and Antoninus. Others limited this community *ad obsequia*, to kind offices of friendship, maintaining the exclusive individuality of the couple in one solitary respect—this one solitary respect made a family party of the couple and their offspring—a private circle, having an interest of its own, supplying its own means, and regulating its own expenditure.

The Church, finding it impossible to adhere to its original maxims, was naturally very much excited upon this question. There was always a large amount of pious feeling, and sincere faith, in her bosom. Fear prompted some; spiritual ferour, and ambition of higher attainments in virtue, stimulated others; and no sacrifice was considered too great, for attaining the desired end of our being, a pure and a happy state of mind. The most unnatural austerities were practised—every species of social pleasure was abandoned. Mysticism embraced every species of self-denial, from the isolated hermit, up to the cloistered monk—from the naked Adamites, whose sexes associated in perfect nudity, without the common feelings of human nature, to the well-clothed and comfortable Abelites and Shakers, who refuse to reproduce their own likenesses in flesh and blood. Community, in all its aspects, has been experimentally tried, with the exception of love alone. Chastity has, to the credit of the Church, been most universally esteemed a virtue; but it is rather unfortunate for that credit, that her idea of chastity has so far

overshot the mark, that the virtue has, in all ages, degenerated into a vice, and proved the source of innumerable evils. The feelings of mankind have always revolted against a promiscuous intercourse of the sexes, even more so than against their violent separation; and the latter system being the collection of solitary individuals, who were merely received, one by one, as they became disgusted with the world, and not the simultaneous act of a society or a people, was more likely to arise in an age of confusion and fanaticism, than any domestic arrangements, which require an enlightened system of procedure, and a large social band, of both sexes, to make even a first experiment. A disordered and an unsocial state of society is very favourable for monachism, and each cloister preserves its own population check, in its conditions of admission. There is no danger of a failure, except through luxury and excess, which alone contribute to the downfall of monastic institutions. As to promiscuous intercourse of sexes, we do not believe it possible; not because it is incompatible with the existence of any civic institution, but because it is contrary to the nature of the human being, and reveals itself in none of his social, or even animal propensities. Love is an individualist. But it is questionable how far there is a necessity for magisterial or political law interfering to enforce a union between two beings, who hate one another; or how far the education of children should be entrusted to parents, to spoil or improve their native dispositions, according to their own whims and fancies.

In these latter questions are contained our ideas respecting community, in so far as the sexes are concerned. Promiscuous intercourse is a vice of such enormous magnitude, that we believe it to be impossible in practice, and we have so good an opinion of the moral stamina of our species, that, in a well-organized moral system, we believe that the conscience would be so powerfully developed, that no species of conduct would be persisted in by any individual, that was calculated to give offence to his fellows, or to the common sense of society. We must not compare the feelings of an unsocial state, in which every man is at war with his neighbour, in almost all his relationships, with a state of associate interest, in which individual happiness is intimately bound up with the private and public happiness of the whole society. The moral law is the law of God. It is the last law which is to be established. It is a law which acts by conscience. There is a sphere of action peculiarly adapted for it; that sphere is the social state, which as necessarily produces the moral sense, as the light of the Sun causes the convolvulus to blow, and the darkness closes its petals for ever.

Community, in this respect, must be subject to the moral sense, and may be safely limited by the rule of Christ,—*"Whom God hath put together, let no man put asunder."*

The same rule may be applied to other departments of this great question of common property,—*"What God hath given to the people, let no man take from them."*

Now, what hath God given to the people? Common nature, air, earth, and water. In these great elemental portions of our mother earth, we have all a right to claim an interest and a share. Moreover, the moral sense of mankind admits this. The public feeling will permit a man to give away his estate to

another man, when it will not permit him to give away his wife. The estate does not necessarily belong to him. It requires mutual love to constitute a moral right to property. Two lovers belong to one another by the bipolar law of attraction; and the earth and the species belong to one another in the same sense; but this rule will not apply to a man and a plot of ground. The love is all on one side, and this is not a binding love. The relationship is not necessary.

But, perhaps, it may be expedient? We do not consider that it is expedient, except under certain circumstances. In an unsocial state, property in land is indispensable for its cultivation. What is every body's property, belongs to nobody, unless every body acts in a social capacity, and cultivates the soil for the general benefit. But as this is the very highest state of social being, it cannot be attained in the infancy of society. Society, therefore, must go through the necessary ordeal of private property in land, to cultivate the soil, which, otherwise, would lie as Nature has produced it, in unspeakable confusion. Social organization puts an end to this necessity. All, therefore, that political economists say of the advantages arising from the personal appropriation of land, we admit to be correct. Appropriation is indispensable for its proper cultivation; but social appropriation would produce more bountiful results than individual appropriation.

But here our idea of common property begins to undergo a little modification. Property does not consist in land alone, but in moveables also, in manufactures, in works of art and imagination, &c. Some of these are individualities, others not. Manufactures, in the general sense of the word, are social productions. Cloth is the production of many different individuals, and requires a combination of skill and labour to produce it. Numerous other productions resemble it in this respect. But painting is an individuality—sculpture is an individuality—so is engraving—so is scientific skill, and ability of various denominations, and each denomination produces a species of wealth or property peculiar to itself, and which, by a necessary law of Nature, must belong to itself. The picture belongs to the painter—the sculpture, to the sculptor—the invention, to the inventor—the skill, to the skillful—the industry, to the industrious—the strength, to the strong. The strong man will do more than the weak, therefore, more belongs to him—the industrious will do more than the indolent, therefore, more belongs to him—the skillful man will do better work than the unskillful, therefore, better belongs to him. These are the distinctions of Nature, of God, and of Providence. Man cannot alter them. Man cannot do violence to them, without rebellion against God and his own nature.

It follows, then, from the above rules, that one may, according to the moral law of Nature, possess more property, and better property than another man; even, as by a similar law of Nature, one man, by superiority of talent, is entitled to more power than another man. But that property must be of his own creation—mediate or immediate—not usurped property, which naturally belongs to the species, and which the moral law forbids any individual to appropriate to himself.

Our idea of community, therefore, is not *absolute*. Absolute community would produce tameness and monotony, and destroy the spirit of society. But agricultural community would preserve the individual rights of all, be an ample security against the fear of want, and be a most successful instrument of moral regeneration for the people, whilst moveable property would afford ample scope for the exercise of ingenuity, the stimulus of emulation, and all its energetic and kindred impulses. According to the present system of grasping, the very inheritance, the birth-right of the people, is stolen from them. An individual may possess a province, he may sow tares, or wheat, as he pleases, and feed dogs or men with the produce. This is the result of the appropriation of land. Were this evil destroyed, the greatest evils of society—poverty, and the fears and moral depravity connected with it, would cease—common food would be common to all, a better food would be purchasable by those whom Nature had raised above the common level, and the best would be procured by those whose natures corresponded with the object desired. Many of these would refuse the best, and willingly distribute it amongst others; the kindly relation-

ships of morality would thus be preserved; no virtue would be lost, whilst many vices would entirely disappear and all would be shorn of their locks.

Here, however, the ghost of Malthus presents itself—a writer whom we very much admire, and a character whom we much esteem, although, in some respects, we think it necessary to oppose him *ad ultimas orbes terrarum*, to the very utmost limits of his meaning. Malthus is abused, *first*, by the poor, who have not read him; and, *second*, by the religious fanatics, who are afraid of the facts which he so powerfully adduces. The delusions which pervade society respecting this insinuating writer, are marvellous; but of these we have no occasion at present to speak, except by way of compliment to the spirit we have conjured up. Malthus says that population has a tendency to become too numerous, and that Nature checks the amount by poverty, pestilence, war, &c. Malthus is right. It has hitherto been so; but Malthus does not say that there is no possibility of mankind taking Nature under their own management, and, by the judicious control of their passions, moderating the supply of human beings, according to the dictates of prudence. Were men to do this, Providence would not require to send epidemics, pestilence, war, famine; and man would then become the son of God, acting in council with God in the moral government of society. But if man, like a mere fish, or brute, merely give vent to his animal feelings without restraint, and bring forth, with as much rapidity as Nature will permit, Nature will indulge him, and bring forth accordingly; but she will apply the rod of chastisement to his back, and remind him by the stripes, that if he wants to be happy, if he wants to be free, he must take the reins of government into his own hand, and learn, by the calculations of wisdom, how to make use of the passions which God has given him to use, but not to serve.*

With this little bit of wisdom, such a community as that we have hinted at, would make a paradise of earth; without this wisdom, any state of social being would prove a curse to the majority of the people.

* Were the question put to us,—“Is there any danger of the world ever becoming overpopulated?” we would reply, “No.” But we can only see two preventives—wisdom, on the part of man, which meets its reward in comfort and abundance; and folly, on the part of man, which meets its reward in social confusion, banishment, warfare, poverty, celibacy, prostitution, and premature death.

“THE PHILOSOPHY OF MARRIAGE.”

A WORK, under the above title, written by Dr. Ryan, physician to the Metropolitan Free Hospital, has just appeared; and which professes to unfold the important subject treated of in all its “social, moral, and physical relations.” No class of persons can be better fitted to enlighten the public mind, in these respects, than medical men, as the wide field of observation which is open to them, and the unreserved manner in which they are admitted into domestic life, in all its phases, furnishes them with data for the most comprehensive and correct opinions on those subjects relating to the basis of all national good—the domestic happiness of individuals. A vast amount of evil unquestionably results to mankind from the ignorance which prevails in society on the subject before us; and this ignorance has been perpetuated by the morbid delicacy attached by most people to its investigation. We trust, however, that a change is coming over the public mind; and that the publication of reputable works on the philosophy, pathology, and physiology of marriage, will meet with deserved encouragement, and be productive of much good, both to public health, and public morals. It is only requisite, that authors should treat the subject in a serious and becoming way, to reconcile the most fastidious modesty to its elucidation. We regret to observe, that Dr. Ryan has not been so scrupulous in this respect as we could have wished, for, adopting the axiom of Haller, that “there are no secrets in physiology,” he has expounded the subjects on which he treats, with a degree of free-

dom bordering, we think, on coarseness and bad taste; for while he deprecates the circulation of licentious books, in relation to the most influential of all human passions, written merely to gratify a meretricious curiosity, he introduces into his own work cases and anecdotes, the relation of which must come under the same censure; and can be of no use, except to illustrate the depravity of our common nature, when under the influence of debasing circumstances. We agree with him, that the physiology and pathology of reproduction are as much legitimate objects of study, as nutrition and respiration; but there certainly can be no need, in order to the due understanding of the subject, to enter into minute details of depraved exceptions to the ordinary laws of Nature, or disgusting instances of their violation, in the one case more than the other. But in our notice of the work before us, we shall not follow the author in his *delicate* paths; but confine ourselves, principally, to the *morale* of the question.

There is much matter of anxious interest in the following extracts:—

"The evidence, and other information collected by the Assistant Commissioners upon the state of the Poor of Ireland, fully confirm the truth of the important principle, which has been the same in all ages and countries, namely, that the only effectual check to surplus population (that is, to the progress of population outstripping that of employment, and comfortable subsistence), is the attachment of the working classes to the comforts and decencies of civilized life. That barrier once removed, and the hopes and ambition of the labourer confined, as in Ireland, to the mere absence of hunger and cold, the labouring population will be found marrying when little more than children, although without a blanket to cover them, or a potato for their next day's meal; reckless improvidence, and callous despair, thus filling the land with hopeless destitution."

"In short, it appears quite certain, that in every part of Ireland, the more destitute the labouring population are, the more recklessly, nay, the more eagerly, and at a much earlier age, do they marry. In the district of Ballintemple, in Sligo, where the continual drifting of blowing sands has buried the land, and all but the roofs of the cabins, the inhabitants have now no access to their dwellings but by a ladder, through the roof or chimney, and subsist upon shell-fish and sea-weed; notwithstanding which, they are marrying, and increasing their numbers, as fast as in other places! It must, however, be mentioned, that the labourers themselves give other reasons for their desire to marry, and that these reasons would really seem to be well founded, in the present lamentable state of Irish society. They say, that their only means of support in old age, or in illness, and under infirmities, are their children; and that they, therefore, marry young, in order that their children may be old enough to maintain them, before their own strength begins to fail, which, in consequence of insufficient food, clothing, and other hardships, takes place at a much earlier age than in Great Britain. Their wives and children can also beg for them, when they cannot procure employment, and their potato crop is consumed, which the pride of the men would prevent them from doing, besides the 'small luck' which would attend an able-bodied man as a mendicant."

One of the witnesses said, that, in Kerry, "a woman had an illegitimate child, with a view (as she herself stated) of having somebody to look after her, when she was too old to take care of herself." Another witness (the Rev. Mr. Yates, county of Sligo), observed, "that he has often thought that the more destitute a man was, the more likely he was to get married; sometimes it looked as if he had taken a wife in desperation, feeling that he could not possibly be worse off."

Bos's inimitable Sam Weller remarks, that people in London, when poverty stares them in the face, are unusually prone to ease their despair, by devouring oysters; and, in this manner, he accounts for the fact, that, the poorer the neighbourhood, the more oyster-shops will be found in it. Not having this resource, it appears, that the poor Irish, in the like predicament, set about marrying; so that, in that country, the accompaniment to poverty is children, not oysters—we wish it were.

But, seriously,—could not the legislature interfere, and prevent a portion of this reckless propensity of the Irish labour-

ers? In Germany, no individual can contract a marriage unless he can show the police, and the priest of the commune, where he resides, that he is able, and has the prospect, to provide for a wife and family. If a poor law be introduced into Ireland, we hope a similar restriction will accompany it. Malthus considered, that one of the greatest evils of the poor law system, in England, was the encouragement it gave to the labouring population to form improvident marriages; and it must be allowed, that the objection will apply, with much greater force, to the population of Ireland.

Dr. Ryan is a staunch advocate of the advice contained in the orthodox text, "Increase and multiply;" and ridicules the hypothesis of Malthus, that *population, unrestrained, will advance beyond the means of subsistence*. In support of the opposite conclusion, he brings forward a somewhat inconclusive argument, namely, that, as the incalculably large reproduction of fishes has not yet filled up the ocean, the doctrine of limiting human population is based upon an unwarrantable and presumptuous doubt in the conservative power of the Creator, to provide for the subsistence of his creatures. Did it never occur to the Doctor, we would ask him, that fishes are kept within limit, by one kind *eating* another, almost invariably; so that, unless we followed the sarcastic advice of Dean Swift,—that is, stew the children of the poor into soup for the rich, his analogy must fail altogether.

On the subject of premature and late marriages, morally and pathologically considered, Dr. Ryan has made some valuable observations. We are not advocates for the interference of government in every matter of social economy; but we do not see how any reasonable objections can be adduced against some legal regulations on this head. It is well-known by medical men, that marriage unions, at too late, or too early a period of life, induce weak and sickly offspring, which is highly prejudicial to the general interests of humanity, and should, therefore, be discouraged by every possible means; as, also, should those between parties who are likely to infect their children with grievous hereditary diseases or idiocy. Parents, too, should be under some compulsory enactment to provide a school education, at least, for their children. Why do not the clergy make these subjects matter for their sermons more than they do, instead of wasting their time in discoursing on mere doctrinal points?

The author quotes medical writers, who estimate the proportion of sterile to fecund women, respectively, at ten to a thousand; one to ten; and six or seven, to three hundred or four hundred. We, ourselves, have formed an opinion that the number of barren women in this country must be greater, and think it probably may be as one to six. This is a subject of much interest in medical statistics. It might be discovered that Nature has reserved to herself a conservative power of gradually decreasing the number of fruitful women as the world increases in age. That some check or other is in operation, is plain, from the fact, that the average rate of increase of the population of Great Britain was much lower during the ten years from 1821 to 1831, than during the preceding ten years; in some counties the decrease on the former average was as much as eighteen, and even nineteen per cent. Some of this diminution may be attributed to the spread of luxury and expensive habits among the people, which, by engendering selfishness and ostentatious vanity, render men averse to the encumbering themselves with matrimony, for fear of its reducing their own comforts, and lowering their station in society. But this kind of check on population is almost sure to merge into vice and misery, as is evident, by the number of abandoned females to be found in London, and all large towns.

Dr. Ryan tells us, that the chief end of marriage, according to all Christian moralists, is the continuation of the species; and, therefore, it is extremely sinful in married persons to wish not to have a family; as it is contrary to the divine and primitive command, "go forth and multiply." In another part of his work, however, he admits that marriages are seldom influenced by any such motive; and adds,—it is useless for us to deny that the majority of marriages, which are apparently based on real love, are almost always the result of our servile and involuntary obedience to the imperious voice of animal passion.

We think this is true. Nature *cheats* us a little in all these things. We no more marry for the mere motive of perpetuating the race, than we eat and drink solely with a view to the nourishment of our bodies, without reference to the pleasures of the palate.

"The passion of love," says Dr. Ryan, "is as inherent in mankind as the function of digestion or respiration, and must be gratified as well as other wants."

"*Omnia vincit amor, et nos cedamus amori*;" love conquers all, and all must yield to it. How desirable, then, that it should be well and wisely directed! "Marriage is a fairy land—the land of promise; but what constitutes its felicity, is to many, if not to most, an indistinct and undefinable question: the universal consent of mankind has pronounced it good and salutary; it is the hope of many who can assign no definite reason or motive for its indulgence." "Most persons," says our author, "expect happiness, pleasure, &c., &c., in the marriage state, but disappointment is the common result; for a good husband, or good wife, is rarely to be found in highly civilized countries, because few strictly follow or adopt the divine precepts of Christianity. (?) He also says, "A philosopher compared a man going to marry, to one who was about to put his hand into a sack, in which were ninety-nine serpents, and one eel;" the moral of which is, that there are ninety-nine chances to one against a fortunate selection. In these two latter deductions, we entirely disagree with our author; but, if those who believe him ever venture upon the hazardous chance of marriage, and should catch hold of a shrew, or a serpent, all we can say, is, that "it serves them right!"

Nevertheless, with all his fearful warnings, our author asks, "Is celibacy always a life of 'single blessedness'?" Have the unmarried no cares, no sickness, or no wants? and, if they can plead no prescriptive right of exemption from the common lot of man, upon what bosom can they pillow an aching heart, or into what ear whisper their many sorrows? what friend will sympathise, with cordial disinterestedness, in all their varied woes?"

We shall take our leave of the work, with a few select extracts:

Longevity.—"Medical practitioners are often consulted by individuals who are anxious to know whether marriage is, or is not, conducive to health and longevity. It is now universally admitted that an answer in the affirmative ought to be given to all healthful and well formed individuals from the adult age to the sixty-fifth year, and sometimes even later. [We have seen it stated, but we do not know upon what authority, that at the age of sixty-three, there are but twenty-two to forty-eight married; at seventy, eleven bachelors to twenty-seven married; at eighty, three single to nine married. Very nearly the same proportion holds good of the female sex, of whom, while seventy-two, who have been married, attain the age of forty-five, only fifty-two unmarried reach the same term of life.]

Fecundity.—"A friend of mine knew a lady of title, who is still a fine and youthful looking woman, who had twenty-seven children. A patient of mine at St. John's Hospital had thirty-two; and a woman, aged seventy, appeared at the police-office, Bow-street, in May, 1834, who stated that she was the mother of forty children; and that her daughters had had twins, three or four times." * * * "M. de Staël asked Napoleon who was the greatest woman in France? He answered: 'She who has had the most children.'"

Influence of marriage on the intellect.—"It has long been observed that men of great genius have fewest children. Experience has demonstrated that the pleasure of love extinguishes the fire of imagination, abates genius and courage, as innumerable proofs have repeatedly attested." "Minerva, and all the muses were virgins." * * * "Ruen observed that no one great genius of antiquity had been addicted to women; and he stated that among the moderns, the illustrious Newton had never enjoyed sexual intercourse." * * * "The sons of great men are generally inferior to their fathers. We seldom, if ever, see great men engender great men." * * * "It has long been observed, that men of genius were the first born."

Singular Cases.—"A man's first child was of sound mind; afterwards he had a fall from his horse, by which his head was

much injured. His next two children proved to be both idiots. After this he was trepanned and had other children, and they turned out to be of sound mind. A lady of considerable talent, wrote as follows, to a phrenological friend:—"From the age of two I foresaw, that my eldest son's restlessness would ruin him; and it has been even so. Yet he was kind, brave, and affectionate. I read the Iliad for six months before he saw the light, and have often wondered if that could have any influence on him. He was actually an Achilles." * * * X.

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon, late Pupil of the Polytechnic School, and Engineer of Mines.
(Continued from page 148.)

MOREOVER, this distribution of the Phalanstère, or abode of the Phalanstère, of which I have given a simple outline, is not only the most favourable for health, but it is a condition indispensable to the complete establishment of passional harmony, which is the principal object of social theory. We shall see, in fact, that this harmony reposes on a basis which is ONE, "The formation of passional series, and their exercise in short sittings." Now the formation of series supposes the concentration of individual habitations in a single edifice, in order that each one may be nigh the common halls; and employment in short sittings, occasioning frequent removals, demands also the luxury of communications, sheltered and tempered; since, without this precaution, the health of the workmen would be constantly endangered during the whole course of a bad season. There is, then, between the material and the passional, a perfect mutual relationship, which produces the *agreement of the good and the beautiful*. This agreement is one of the distinctive characters of the social order, in opposition to the subversive or unsocial order, in which the agreeable and the useful are always at variance. At present, when you see a house well furnished, elegant, and sumptuous, you may safely say, "this is the dwelling place of pleasure and of idleness, the habitation of the workmen being almost always below mediocrity." Modern luxury produces no effect more obvious than the separation of the different classes of society. In the harmonian order, luxury will have an entirely opposite effect.

The harmony of the material and the spiritual is not less remarkable in the law of agricultural employment, in the domestic establishment, than in the distribution of its edifices. I have shown, in the first article, that labour, in short periods, has the great advantage of permitting the same individual to take part in a great number of different groups, whence results, as an individual good, the full development of the faculties, and as a collective good, the absence of corporative selfishness. In the theory of M. Fourier, the law of culture corroborates the effect of labour in short sittings, by favouring numerous relations between the series during the continuation, even of their different occupations. "Every agricultural series endeavours to throw out branch parties upon different points. It thus undertakes the cultivation of detached plots, in all the different stations of series, whose centre of operation is at a distance from its own; and by means of this intermixture, the district is covered with groups, the scene is animated, and the general appearance varied and picturesque. But this intermixture of employments agreeable in its general aspect, is yet more useful in respect to its amalgamation of passions and complicated interests. These combinations have for their object, the bringing together divers groups upon a single spot, and leaving a group as little as possible alone in its labours, although limited to short periods, &c.

We must see, in the work itself, the brilliant description of the appearance which a country thus cultivated presents, and the charm which the mutual meetings of the groups of workmen will shed upon their labours. Under the economical point of view only, M. Fourier shows that at present, the piecemeal system forces the cultivator to crowd together twenty sorts of produce in a narrow enclosure, and prevents him from planting as orchards or kitchen-gardens, a number of exposures (*expositions*) which would be propitious, but being too far removed from his habitation, would not be pro-

teeted from robbery and devastation; whereas when every district shall be cultivated in unity, that is to say, as if it belonged to one individual, one might, without fear of robbery, intermix every species of produce, grasses, flowers, fruits, and vegetables, according to the virtues of the soil. Here, then, and it is upon this that I insist, there is a coincidence of arrangements the most favourable—whether in respect of economy, pleasure, or, in fine the strengthening of the social tie. It is by this constant property that the material arrangements of the social domestic establishment are really of very great importance.

Let us not forget, that, in agricultural employment, each group has its moveable tents, to protect it from the heat of the Sun. Each series has its booth placed in the centre of its labours, there to deposit its clothes and instruments; there to take refreshments, or collations, sent from the phalanstere, &c. In a word, every thing is foreseen, and arranged, in such a manner as to create emulation, charm, variety, attraction, in all the operations of agriculture. For, not to look but at the very smallest details of practice, the ardour of the groups will suffer them to forget nothing, such as the sheltering of young shoots and flowers against the morning frosts, or the too great heat of the day; and if showers of rain or hail should threaten, the devotion of all the phalanx, as when a vessel draws water, and heats both passengers and crew, would instantly arouse them to action. In fine, each phalanx has its botanic garden, its warm and cool green-houses, &c., every thing that, at present, the most wealthy proprietor can create and maintain only on a very small scale, and at great expense, which, by the benefit of association, will afford new sources of pleasure and advantage.

The care of the stables, of the poultry-yard, of the pigeon-house, &c., is not of less importance than that of vegetables. There, again, attraction is insured, by means of the elegance and cleanliness of the buildings, by the minute division of labour, which permits every one to occupy himself only with that portion of employment which pleases him; above all, by the co-operation of individuals attached to the same kind of exercise, for no group would ever admit an associate who is indifferent to the general success.

In fine, the social domestic establishment does not apply itself solely to agriculture. Independent of the labour of the forge, cartwright work, masonry, &c., which are immediately connected with this art, the phalanx has many other species of employment, which it keeps in activity, chiefly in bad weather. It is still the attraction of the associate which will determine the choice of these employments. It is of importance that they be of such a nature as to engage, passionately, men, women, and children; for if agriculture be an essential occupation, or, as M. Fourier says, the pivot of the social domestic establishment, it is, because, among other reasons, it offers, in the great variety of its labours, a powerful attraction for all ages.

When the social (*unitaire*) organization of the world shall have been established, every community will be employed upon certain exotic productions, which will have the advantage of uniting it particularly in interest, and putting it in direct correspondence, with other communities in remote countries. It will have, moreover, numerous relations with neighbouring communities, whether in respect to the exchange of commodities, or co-operation in urgent business, as in the formation of district cohorts, for the accomplishment of works of common interest, or which require, by their nature, an additional impulse of attraction. It is thus, that, for the most part of the operations of mining, each community of the same district will furnish, during the course of a campaign, some cohort, to which will be reserved great advantages. This, perhaps, would be the place for giving an idea of the organization of industrial armies, classed in different degrees, according as their labours have relation with the general interest of a district, a province, a kingdom, &c., or even with the entire cultivation of the globe. In his first work (1808), M. Fourier has given, on this subject, most minute details, but, under the necessity of being brief, I can only refer the reader to the treatise of 1822, in which he will find the most magnificent ideas, on the restoration of climates, the re-clothing of mountains with woods, the attack upon deserts, &c.

These operations, suppose the previous establishment of harmony, that is, of agricultural domestic association, to which I now return; and, now that we have given a *coup d'œil*, or bird's-eye view of the material arrangements, we will follow the author in the examination of the most important questions of the passional order.

[There is only one remaining chapter of Abel Transon's Summary of Fourierism, which we will divide into two, remarking, at the same time, that this summary is merely an outline of the practical department of Fourier's doctrine; for the ingenious Socialist has not confined himself to mere practical subjects, he has made a philosophy, as well as a science, of his system; extended his researches, through time and space, to the very skirts of the universe, and brought it into harmonious bearing with universal science, Nature, and revelation. These are the ornamental and atmospheric, or aerial departments of Fourierism, not necessarily connected with it as a practical system, but vastly entertaining to the imaginative mind, which loves, at times, to rise above the clouds of the valley, and shake off the dust it has gathered on its brogues.]

THE TRANSCENDENTALIST'S DIALOGUES.

No. XVI.

ON TIME AND SPACE.

(Continued from p. 156.)

Transcendentalist discovered writing a letter.

Trans.—Dear Shepherd,—The fact of an infinite number of points without magnitude being = 0, was stated in Dialogue XIV. In my last, I wished not merely to refute fallacies, but to give a *positive* definition of motion. Yours, very truly—T."

Enter Idealist.

Ideal.—Well, have you thought about motion, &c. since I last saw you?

Trans.—Alas, no! I have been dealing in the most worldly matters—have been altogether "immersed in sense," as poor Tom Taylor would have said, and utterly unable to attend to abstractions. Now, thank God, there is a short respite, I shall be happy to have a little metaphysical talk. Let us chalk up on our slate the results of our last dialogue.

I. The energy of what exists in power, considered as so existing, is motion.—Aristotle."

II. The line produced by a body in motion, while in the act of being generated, is a continuous quantity, incapable of resolution into a discrete one. The attempt to divide it into parts is the basis of Zeno's fallacy.

Ideal.—Is not your use of the words "resolution into a discrete quantity," rather singular? You mean by it to imply "division."

Trans.—And supposing I do, I think I am right. Let us turn to our Aristotle, and see what he gives as a specific character of quantity continuous. The parts of it, says he, have the property "*pros tina koinon horizon sunaptein*," i. e. they fit together with a common boundary. The absence of this property would convert a quantity continuous into a quantity discrete. Let the following figure,

represent a board with two marks upon it, dividing it into three portions, A, B, and C. The line between A and B is the common boundary of both, as likewise is the line between B and C. Hence, the whole is a quantity continuous. Let us put an end to this community of boundary, and separate A, B, and C,

The act of separation destroys the community of bound, and

* I assume that every reader of this dialogue is acquainted, at least, with the last two.—T.

we see that A, B, and C, have separate bounds of their own, independently of each other. The quantity is now discrete, though, of course, each of the parts is still continuous. Now observe, that a quantity continuous is not divided, but is merely divisible; directly the act of division takes place, it becomes discrete. The Materialist and I once talked of this matter, when we spoke of the "one of aggregation," (or quantity continuous,) and the "one of ultimate division," (or the unity of a discrete quantity, which unity was utterly without continuity, in other words = 0). Observe, further, that the quantity generated by a moving body is not only undivided, but absolutely indivisible. We may, therefore, enumerate three species of quantity:—

1st, Quantity discrete.

2d, Quantity continuous, or that which is resolvable into the discrete. *Actually* having no parts, but capable of being resolved into them.

3d, Quantity ultra-continuous, or that which is not resolvable into the discrete; which hath no parts, either actually, or potentially. This is the quantity produced by motion.

Ideal.—Methinks we are verging a little from the second result chalked on the slate; there we defined the line of motion as a "continuous quantity." Now, one of the characters of continuous quantity, is, that "the parts fit together with a common boundary." If, then, the line of motion has no parts at all, how can it possess this character?

Trans.—You see, when we wrote up those results, we only thought of the division of quantity into discrete and continuous; and, certainly, the line of motion had more of the characteristics of the second. Quantity continuous is "much," not "many," so is the line of motion; nay, the very character given by Aristotle to quantity continuous, was that which based a connexion between itself and quantity discrete, viz., the having of parts. Hence, I think we shall not be wrong in calling the lines of motion "quantities ultra-continuous."

Ideal.—In Dialogue XIV. we defined quantity continuous as that whose division is supposed to be infinite.

Trans.—We did, and though I doubt whether the definition was quite full enough, I do not think it bears against my calling the line of motion ultra-continuous. If you do begin attempting to divide a line of motion, you must consistently go on without stopping. What I deny is the power to begin. In dialogue XIV. we considered the line of motion as commonly continuous, and at once fell into Zeno's contradiction. To steer clear of this we have given the line of motion a characteristic with a new name, viz., that of being ultra-continuous. I am afraid we have not advanced very far in this dialogue; but, at the same time, I think it has been useful as exhibiting a collection of the results of some former dialogues; and that the new division of quantity into discrete, continuous, and ultra-continuous, will at any rate prevent several mistakes.

TRANSCENDENTALIST turns to his readers.

And now, my gentle readers, what do you think of this talk about quantity and motion? Do not those of you who are acquainted converse together, and say, "What is friend T. about? He promised to tell us about the imaging-power, and the generation of time and space, and all sorts of sublimities; and now we find him talking about rolling bodies, and cylinders, and lines of motion. And then he begins giving us scraps of Aristotle, and tastes of James Harris, who (honest men) knew as much of the imaging-power as a Methodist parson does of the Greek Testament. What, we should like to know, has all this to do with the imaging-power?" To which I answer, that all my dialogues have a connection, and that, when I began talking of the operations of the imaging-power, a difficulty started up in my own mind, which I thought a scientific investigation into "motion" would remove. I tell you again, I have no system cut-and-dried; you have all my doubts, conclusions, enquiries, &c., &c., hot from my own brain,—one grows out of another, and hence want of connection is impossible.

BLACKWOOD'S MAGAZINE, ON GEOLOGY AND EDUCATION.

"THE meeting of the Scientific Association at Liverpool has been among the most popular of those anniversaries. Things of this kind are easily turned into ridicule, and it must be acknowledged that some of the communications read at the meetings were remarkably trifling. We doubt whether the oratory of the professed haranguers was much above the commonplace rhetoric which usually figures in all assemblies, when self-sufficiency in the speaker is corresponded to by noisy ignorance in the hearers. And we think a much worse symptom, too, there is in all those meetings—a tendency to set Scripture and science at variance, and to assert a silly superiority over prejudice, on the silly ground of believing the nonsense of some rambling geologist, in preference to the declared and precise language of inspiration. But at Liverpool we certainly were spared the offensive folly of the hurrah of the rabble of cognoscenti, on a clergyman's giddily giving a date and origin to the world, wholly contradictory to that which is expressly given in the Bible. The point is of the very highest importance, for if the Bible is untrue in one solemn statement, what is to sustain its authority in others? And we are to observe, that the Mosaic origin of the world is stated as a *fact* in the most important and solemn document in the Old Testament. The ten commandments is the *only* fact stated there, and on the statement of that fact is founded the institution of that seventh day, which was appointed to be kept sacred to worship, and to human rest, through all ages, for the distinct emblem of the final happiness of mankind. "In six days, God made heaven and earth, the sea, and all that in them is, and rested the seventh day." Nothing can be more unequivocal than this language. It is not to be diluted away by any critical artifice, such as that which profanely toys with the general Mosaic narrative. If the sceptic shelters himself under the phrase, "in the *beginning*," as indefinite, and idly argues that it *may* mean a thousand or a million of years, there is no possibility of even the shadow of such subterfuge, trifling as it is at best, in the language of the Decalogue. There the six days comprehend the whole mighty operation; and we have only to decide between the direct words of the Deity, and the flippant conjectures of busy sciolists, dabbling in enquiries confessedly in their infancy, investigations which have not examined a millionth part even of the earth's surface, which know nothing whatever of its interior beyond a few lime-pits and coal-mines, which are, by their own acknowledgment, but beginning to have any conception of the great agencies—the magnetic, electrical, and ethereal influences—probably instrumental in all the phenomena of nature. This presumptuous philosophy is already forced to feel that there are other agencies at work, of which man knows nothing but by their necessity, and which may be as numerous as the sands of the sea, and as powerful and extensive as gravitation itself. Yet it is in the midst of this mass of immaturity and ignorance, that the pretended philosopher lifts up his pert physiognomy, and pronounces his impudent oracle. The heavens and earth were created within the term of *six days*, or the Decalogue is untrue. If the geologist puts his little authority against this most solemn and awful of all Divine documents, we say, let him beware of the contradiction that amounts to blasphemy. If the ten commandments can be false, nothing in religion can be true. Is this putting down reason by religion? No. It is giving the greatest weight to reason; for it is arguing from that reason which proves that the Deity cannot propagate a falsehood, to the fact, that what he has declared must be a truth; that it is infinitely easier for human inexperience to blunder through want of knowledge, and for human vanity to blunder through want of sense, than for the Divine Being to partake of human fallibility; and finally, that it is wise to distrust the conclusions of inadequate knowledge, and wiser still to take as the principle of all investigation, the maxim, that the Deity can no more deceive than he can be deceived.

As to the childish subterfuge, that the "Days of creation may have been incomparably longer than days at present," let the astronomer settle this question. He will tell the sciolist that the addition of a month in the year would have required a totally different bulk of the globe, or a vast change in its gravita-

tion—and that the lengthening of the day by even a single second, or its shortening by a single second, would have amounted, in our era, to an addition or diminution of no less than six hours in the day—a change which would totally subvert the length of the year, and with it the whole economy of vegetable and animal nature. In fact, the whole hypothesis is untenable.

It is to be observed, in the entire of this subject, that of all the sciences, geology is at present least worthy of the name of a science; that it is little more than fifty years old, owing its birth to Werner in the middle of the last century; that it must be, from its nature, the slowest of all sciences, it being wholly a matter of facts acquirable only by separate, slow, and extensive investigation of the surface of the globe. Yet of all the sciences it is already the most presuming, and every trivial gatherer of pebbles fancies himself master of a theory of the globe. It is also disingenuous, for it assumes as facts what it must know not to be true. It thus states, that the globe is covered by four distinct layers, the agricultural soil, a layer of the remains of animals, a layer of those remains mixed with the remains of rocks, and a layer of solid granite. All this is untrue. The inspection of any common section of a mine will show that the mixture of strata is of the most miscellaneous kind. Again, we ask, has any man ever seen the supposed granite crust which is supposed to envelope the interior of the globe? Certainly no man. If the remnants of animals are generally within a small distance of the surface, what other evidence does this give, than that they were deposited there by some action not descending far below the surface, a deluge, or sudden catastrophe on the face of the globe? Even the perfect state of these skeletons shows that the catastrophe must have been sudden. For slow decay dissolves the frame-work. Unless the geologist adds to his theory that they were regularly laid up in coffins, mammoths and all. But bodies of animals suddenly overwhelmed, wrapped in clay, and thus excluded from the air, might last in their skeletons for ages. All this is not said to discountenance the true pursuits of the geologist, but the arrogance of the impudent and giddy infidel who boasts that he has found out an argument against the Scriptures. It is also to remind those of the clergy who are silly enough to lend themselves to the propagation of such follies, that they know as little of true geology as they have respect for the supreme wisdom of inspiration. We say that inspiration and science cannot be contradictory. We say that true wisdom, where any seeming contradiction appears, will wait for more facts, and, above all things, abstain from the insolent absurdity of pretending that religion fetters the mind in the investigation of nature.

This is the true principle of all useful enquiry; on this principle Bacon proceeded, and on this alone true science will suffer man to approach its wonders—namely, to take it for granted that the Deity understands his own works better than man can understand them; and that what he has revealed of them in the Scriptures will be finally demonstrable even to the feeble comprehension of our limited capacities."

[We will make a few remarks on this disguised infidelity next week.]

THE CONVOCATION OF THE CHURCH.

This question is beginning to be agitated, and as upon every other political and ecclesiastical subject connected with the possession of power, wealth, and repose, extreme opinions are entertained by large and influential parties. The motion of Mr. Borthwick, last session of parliament, to re-assemble the convocation, did not even receive the complimentary reception of a discussion. It was cast out in a thin house, deserted by both parties. Whether this was owing to the individual or the question, we know not; but since that time, the subject has made considerable advance, and a large body of the clergy are favourable to the measure. We believe, also, that it is the most sincere and upright portion of the clergy, who are desirous of having this opportunity of publicly declaring their willingness to adopt some salutary changes in the ecclesiastical department of our national economy. The idle and content would rather have things remain as they are.

We are rather surprised at the fact of the liberals opposing this idea of arraignment the church before the court of public opinion. The effect must necessarily be favourable to progressive amelioration. The clergy would then appear bodily in a corporative capacity before the nation; their character would be subject to matter of fact observation and criticism. We should be able to determine what were their positive ideas of moral education; whether it consisted in merely endowing plenty of stalls, and filling the racks with the best fodder, and suffering the animal to chew the cud in luxurious ease; or whether the idea of yoking the oxen to the plough, and making them till the ground which furnished their plentiful subsistence, did not form part of the orthodoxy of the successors of the Apostles. We should then hear from them collectively, whether preaching to the rich and middle classes in warm comfortable churches, whilst the poor were wandering comfortless in the streets, or lying helpless in filthy and infested hovels, destitute of all that could minister comfort to their bodies, or hope to their souls, was all that was required of the steward of the mysteries of glad tidings to the poor. We should then batter the church effectually as a combined whole, we could then then embody all its component parts into one, and with official documents, which at present we cannot procure, we could convince the doubtful, that those very men to whose keeping the morals of the people are committed, either do not understand the philosophy of morality, or are personally interested in preserving a large portion of the people in vicious circumstances in order the more effectually to demonstrate to their associates in the upper circles, the necessity for keeping in pay a "Spiritual Legion," as the preservers of that species of "fearcraft," by which the rich are enabled to pursue a system of robbery, and the poor are induced to believe that cunning robbery is no theft, and that the crime consists only in doing it rudely.

We have little doubt that the convocation will be re-assembled, and form a new and interesting subject of public criticism.

SPIRITUALISM OF THE BRITISH ASSOCIATION.

In the first volume of the *Shepherd*, we more than once, in our controversy with materialists, had occasion to deny the existence of atoms, or at least the possibility of proving their existence. We are happy to quote the following scientific testimony in our favour from the last report of the British Association.—*Athenæum*, p. 747:—

"Mr. Whewell stated that he was opposed to the adoption of any rule of philosophizing, but that which is founded on a knowledge of the laws of phenomena, and took exception to certain expressions employed by Professor Johnson; such as speaking of atoms as if they had a real existence. Sir William Hamilton concurred with Mr. Whewell in objecting to the use of the term "atom" usually made, and conceived, with Newton, that Phenomena, being referred to the affections of atoms may be due solely to attractive and repulsive forces. As for his part, he rejected the existence of atoms altogether and would replace them by attractions and repulsions acting upon mathematical points. Dr. Kane conceived that the abuse of the term "atom," alluded to by Mr. Whewell, and Sir William Hamilton, could not with truth be charged upon any well informed chemist. Dr. Faraday also objected to the employment of the term "atom" in chemistry, as he conceived that atoms were not only hypothetical, but that their existence was *obviously disproved*, even by the report of Professor Johnston. Dr. Faraday emphatically stated that he was not an atomic chemist."

Now what is the ultimate meaning of all this? a scientific renunciation of materialism. If the very existence of atoms be doubted or disproved, what remains? nothing but Sir William Hamilton's attraction and repulsion, acting upon mathematical points! In other words science leads at present to the demonstration of *only the phenomenal* existence of matter, whilst it regards attraction and repulsion (pure spiritualities) as the positive substrata.

PROPHECY OF SETH DARWIN, QUAKER,

IN THE REIGN OF CHARLES I.

Author of many strange and wonderful Prophecies.

"THIS fair kingdom travaileth with sore travail; but as a woman bringeth forth with sore pain, so are kingdoms, regenerated with toil and trouble. There must be many births amongst us, before perfection cometh. For, lo! wisdom is tardy, and when she be fully come, she shall not be long tarrying; because, when you behold the tide at full, it pauseth but a short season, and neither Sun nor seasons stand still. And behold, man is the creature of folly, and the foe of truth. All things change; yea, men's minds change more than all things, and they who are now the most blind, and the greatest enemies of truth, shall, amongst our posterity, become the grand restorers of it. Our neighbour kingdom of France is now at peace, but before the death of the next hundred years, she shall be in travail, and bring forth such plagues, that the like has not been known in the latter ages of the world. In those days the life of man shall be valued as nought, and men shall see truth, and own it, but belie it in their deeds, and their hand shall be upon all the world, and all the world upon them; and their fashion shall prevail over all the west."

This was spoken before a magistrate, before whom he was taken, for going naked, up from the waist, into a church. It was committed to writing by the clerk, and a copy of it given to the publisher, by the Rev. John Wesley, in 1750. Being urged to speak of the Holy Scriptures, he said they were "smoke, dead embers, and rotten bones of dead men."

WRITTEN LAWS.—"Give me leave," says Anacharsis, the Scythian, to Solon, "to tell you, that these written laws are just like spider's webs. The weak and small may be caught and entangled in them, but the rich and powerful will break through and despise them."

[What sort of laws would the philosopher have but written laws? The laws promised by TRUE religion—laws written on the heart, living in the life—laws which form a part of one's self; so that one would as soon hurt the apple of his eye as break them. These are the laws. Book laws are not worth keeping, and God has sent the spirit of disobedience, to agitate, agitate, agitate, until book laws are superseded by heart laws.]

COLERIDGE'S IDEA OF EDUCATION.—Knowledge being power those attainments which give a man the power of doing what he wishes, in order to obtain what he desires, are alone to be considered as knowledge, or to be admitted into the scheme of National Education. Subjects to be taught in the National School:—Reading, writing, arithmetic, the mechanic arts, elements and results of physical science; but to be taught, as much as possible empirically, for all knowledge being derived from the senses, the closer men are kept to the fountain-head, the knowing they must become.—*Church and State.*

[But Coleridge laughs at the idea of popularizing science which will only effect its "plebification" or vulgarization.]

CURIOUS KIND OF REACTION.—The inundation of Bibles from Earl Street, over all parts of the civilized world, has not always met with the success which it anticipated. Curious to tell, it has produced a scarcity of Bibles in Norway, by underselling the booksellers, and making it an unprofitable speculation to lay in a stock of the "word of life." Mr. Laing, in his "*Residence in Norway*," says it is almost impossible to procure a Bible, and the booksellers lay the whole blame upon the British and Foreign Bible Society.

COPPER-COLOURED IRISH.—The Alganekine are the most influential and commanding people in the whole of North America. Their name in Irish indicates as much, viz., algan-kine, or kine-algan, a noble community, corresponding to the Phœnician words, algand-gens, which means the same thing. The

language of this people is the master language of the whole country, and what is truly remarkable, understood, as Baron Humboldt asserts, by all the nations except two. What, then, are we to infer from this obvious affinity? Why, undoubtedly, that a colony of that same people who first inhabited Ireland, and assigned to its several localities their characteristic names, had fixed themselves at an early date in what has been called the "new world."—*O'Brien's Notes to Villanueva's Phœnicia, Ireland.*—[Then the native American Indians are nothing but copper-coloured Irishmen.]

Why are inferior animals more weatherwise than man? Because instinct is stronger and wiser than reason; only it cannot move so freely in complicate circumstances.

KING CHARLES THE MARTYR.—I have seen his letter to the Pope (preserved to this day in Rome), wherein he intimates his readiness to barter the Protestant religion in England for temporal assistance from the Holy See.—*Dr. Wiseman's Letters to Poynder.*

[There's a noble specimen of Protestant martyrdom!]

TO CORRESPONDENTS.

We observed the 0 + 0 of the 14th letter, but thought, from the concluding sentence, that T. was going to change the subject. We do not wish to interrupt the current of his thoughts during the progress of any investigation, but we mean to require his opinion upon one or more subjects before we have done with him. By revolving our last notice in his mind for half an hour, he may discover one of them, and that regards the distinction between faith and knowledge, a question very much connected with his own letters. We meet with very intelligent men who abjure faith of every kind in the pursuit of knowledge, i. e., they profess to abjure it, and we should like (for our own benefit) such an acute metaphysician as T. to analyse these two words, and endeavour to determine whether or not there is a portion of faith in all human knowledge, and if any knowledge beyond mere consciousness can be possessed without faith. If T. does not find it convenient to link this question into the chain of his inquiries, a separate letter on the subject, when he can find leisure, will prove acceptable.

A reader of the Shepherd spoke privately to us of an expression which we used a week or two ago in our leading article, to the effect that we did not attempt to stir up any enthusiasm on the subject of association. We allow that it is not very satisfactory; but our meaning was, that we were afraid of enthusiasm until it was properly enlightened as to its objects, and means of attaining them. We consider that the principle cause of all failures in laudable attempts to ameliorate society, lies in a hot, and impatient, and feverish enthusiasm, without a clear conception of the various difficulties which are to be encountered, and the objects which are to be realized. Enthusiasm we do want, but it must be enlightened, in the leaders at least, who will take care to check any foolish excesses in those who pay respect to their authority. Moreover, it must be united. We have been musing on the form of a covenant for association; we will try a rude model, merely to see how it would be received.

[PRICE 1½d.]

WHO ARE THE FAITHFUL?—CHRISTIANS OR INFIDELS?

"Faith is the substance of things hoped for, the evidence of things not seen."—*Bible.*

THE universality of the belief in a general restoration of human society is one of the most remarkable features of the history of man. The various forms in which that faith has appeared, the infinite multiplicity of modes in which the great event is expected, are not subversive of the general assertion, that the faith exists, and has existed in all the successive ages of civilization. It belongs to all progressive nations, and assumes different forms and characters, in conformity with the religious peculiarities of individual sections of our species. It is interwoven with all religions, and forms the very base and pinnacle of many. It is incorporated with Paganism, Deism, Judaism, Christianity, and Atheism. It is the most universal species of faith that we know of, for it is compatible with every variety of opinion respecting the being and existence of God, whether affirmative or negative.

Would it not be accounted very strange to the world, if this faith, so very accommodating, so far removed from any species of sectarianism, were the living and the saving faith, so much talked of by divines? In our opinion, it is the highest species of faith, and we doubt not we shall be able, both from Scripture and reason, to demonstrate that it is so.

Abraham was called the father of the faithful—the founder of the house of faith. But Abraham's faith was merely the faith or hope of a golden age—the faith of redemption to mankind—the faith that in his seed all the nations of the earth should be blessed. He looked for a temporal deliverer, and believed in a temporal redemption; any thing beyond this temporal redemption is not even alluded to by his biographer, Moses. Moses treated the children of Abraham with the same worldly doctrine. Bishop Warburton denies that there is the slightest allusion to a future state, in the writings of Moses. The deliverer was a temporal deliverer; the hope and the faith were merely the foresight of a better system of society. The Jewish prophets kept up this original species of faith, by their luxurious and imaginative pictures of Messiah's reign. A new heaven and a new earth were promised—plenty, and peace, joy, and gladness, the dance and the song of a happy people, were the burden of the "word," as it came from the seers and bards of Israel. In the indulgence of that hope, this singular people were trained. The disciples of Christ entertained this hope, even to the very moment of his ascension, and the last question they put to their master was this, "Wilt thou at this time restore the kingdom to Israel?" that is to say, wilt thou at this time regenerate society, by establishing on earth the reign of peace? And even after his disappearance, this same faith continued in the Church. The expectation of Christ's immediate return, for the purpose of universal deliverance, continued for many generations, until repeated disappointments gave encouragement to the mystical and spiritualizing system of doctrine, which has sublimated the faith of the terrestrial kingdom of

heaven into a species of spiritual quackery, which lulls the senses of men, and forbids every active exertion to realize the hope which belongs by birthright to the Church.

Faith in the Christ, or deliverer, is the true faith. The Jews have this faith as much as the Christians. The Jews are Christians. Every Jew, who believes in the redemption of man is a true Christian, for faith is not a retrospective, but a prospective act. The redeemer of man is the Christ. "*Ho Christos,*" "Christ" was not the baptismal name of Jesus of Nazareth. Christ was a word as familiar to the Jews before the time of Jesus, as it is to us. It is a word like "sovereign," and belongs to a rank or station, the seat of the supreme authority of peace. It belongs to the first individual, by way of eminence, who establishes this peace, and to all his successors, as the co-inheritors of that authority which is peculiarly *divine-human*, partaking of the two natures, and combining all the attributes of excellence. It was given to Jesus because it was imagined that *he was the Christ*. He has not yet realized that character—the hope is not yet fulfilled. Abraham's faith is not yet justified. The Jew still holds it prospectively, and the Christian, who holds it retrospectively, cannot give a satisfactory reason for so doing—he cannot satisfy the simple mind, that Jesus of Nazareth has fulfilled the office of the deliverer, without promising a *second coming*. The Christ that the Jew looks forward to, is the same power of God that the Christian looks back upon; and if the Jew wants the retrospective property of faith, the Christian wants the prospective, and thus the two parties divide the faith of Christ between them, neither being fully possessed of the faith. Both, therefore, are partial Christians.

But the *Infidel*, who believes in the restoration, or redemption of man by natural means, without regard to the promise to Abraham, and the faith of the Prophets, is also a Christian. He believes the promise. God has various ways of revealing his mind—by vision, by oracle, by impression, by reflection, by scientific investigation, and each of these methods has a peculiarity of its own. Each looks at the object through its own eye-glass, and its own medium. One sees the millennium in vision, all radiant with solar light, and rainbow colour, angels and archangels ascending and descending, *heaven corresponding with earth—a miracle*. Another sees it merely as a highly civilized and cultivated state of being, in which the arts will minister to human wants so abundantly as to supersede the necessity of severe bodily labour, in the production of wealth. Another regards it in the light of a new social contract, in which the rights and privileges of men shall be equalized, and a just distribution of education and wealth be administered by fraternal association. These various prospects are one in substance, however much they may vary in the details. But we are sorry to say that the different parties who thus zealously follow the inward motive of faith, live in personal hostility, and regard each other with contempt and aversion. What is the faith of an Irvingite? a faith in the deliverer. What is the faith of a Southcottian? the same. But the difference between the two is this, that the Irvingite believes it *must* be Jesus of Nazareth who will come again, and the Southcottian believes it *must* be his spirit coming in an individual, in the faith of "*the woman's*

writings." What is the difference? Nothing but wind, wind. Yet the two parties live at enmity; the one regards the other as in Cimmerian darkness; and the Irvingite, especially, who is the less universal of the two, regards the Southcottian as under the delusion of the devil. What is the difference between these two and the Owenite? The Owenite believes that the world must one day be socialized—that individual man will be regenerated when society is reformed upon rational principles—that redemption will take place when men live together, as the early Christians are said to have done; in common, and that this spirit of socialism must soon be forced upon society by political necessity. What is this but the coming of Christ after all? It is taught in another form, it speaks another language; but still it is in substance nothing less than the faith once delivered to the saints. Does God regard it as any thing different? It does not take the name of the faith of Abraham, but it is in spirit the same. It does not take the name of the faith of Christ, but it is Christian in its meaning, and truly that God who looks to the spirit more than to the letter, will be more likely to regard with favour the spirit and power, than the mere name and form of Christianity.

Self-nominated individuals are always suspicious characters, in respect to qualifications. We have always been taught to despise the legislator who nominates himself a representative of the people, or the clergyman who nominates himself to a benefice, or the man who trumpets forth his own praises in any capacity. There is an instinct in every man, which teaches him that this trumpeting is fallacious. Why should not this rule be applied to Christians? Why should he who blazons himself abroad, as a *disciple of the meek and lowly Jesus*, be the man who is so in reality? Nay, why should it not frequently happen, as it often does with respect to other virtues, that the man who actually refuses to call himself a Christian should be one in reality, even as he, who refuses to speak of his generous deeds, is sometimes detected in the performance of works of the most exalted benevolence, whilst those who are proud of declaring their works of charity, are most frequently destitute of its living spirit?

It may seem strange to those who have been accustomed so long to the self-laudation of the Christian world, to hear it disputed, whether the Christian or the Infidel is, at present, most instrumental in forwarding the work of genuine Christianity.

There is one thing certain, that the Christians are all moralists of the old school—conservatives of a system which has proved a remarkable failure—a system, whose fruits are theft, prostitution, contention, deception, grasping, accumulation and selfishness. We know of no efficient plan of operation, which has ever been proposed by the Christian moralists, for the prevention of these evils; and even if we heard of the conversion of a thousand thieves and prostitutes, we feel certain that it would only amount to an exchange of individuals—that a thousand other victims have been dragged, by the common snares of vice, to fill up the vacuum occasioned by a useless system of proselytism. Diminution of real crime we believe to be impossible, in such a social order as we now live in. Moreover, education only changes its form. The vulgar pick-pocket, who snatches a handkerchief from *your* pocket, when it hangs carelessly out as a temptation to the emptiness of *his*, is but a mischievous little child in the game of life, in comparison with the more learned knave, who circumvents you, by his cunning in the mysteries of law and the intricacies of trade; who writes bills and accounts with the facility of a banker, and composes in prose and verse, with the elegance of an Addison or a Pope. There are many thousands in London, who can respond to this truth—who never lost ten pounds by a common thief, but who have lost thousands by *gentlemen, finished gentlemen*, who walk at large, and enjoy the common protection of honest men, with all the honours of men of respectability. Education will change the character of crime, but it requires more than education to remove crime. Now nothing will remove crime but that which removes the incentive to crime. It is a law of Nature, that that which is incited to action should move. Knowing this unalterable law, it is our duty, not to oppose it, but endeavour to remove every incentive to an evil propensity, which can only be destroyed by withholding its nou-

ishment. The Infidels are the only parties who act upon this wise system. As practical moralists, they are, therefore, likely to supersede the Christians, unless the latter resolve to act a more merciful part, and reduce to practice the petition of their Master,—“Lead us not into temptation, but deliver us from evil.”

From all that we have said above, we regard the good moral infidel, who believes in the regeneration of society, and adopts the foregoing system of practical moral education, as a better Christian, both in faith and practice, than the praying, Church-going, hymn and psalm-singing, *believer* (?).

Notwithstanding, we do not consider his state of mind as *reasonable*. We cannot regard any system of philosophy as reasonable, or even as deserving of the name of philosophy, which puts a negative upon the divine mission of Moses, Christ, and Mahomet, especially the two former. It appears to us to be the most glaring inconsistency, to regard any of the movements of Nature, more, especially, the great organic and social movements, as accidental, or to regard them in any other light than as successive stages of progress, not final, but serving a temporary purpose, and leading to higher and more advanced conditions of moral being, containing the embryos of future systems, and destined to blow and expand, to give those future systems being.

This is true philosophy—philosophy which takes the new out of the old—which makes the past the matrix of the future—which grows grapes on the vines of Nature's own production, by pruning and culture, and is not so foolish as to uproot and destroy the vines which bear ill, in the preposterous attempt to grow grapes without them.

Revelation is a vineyard, and man is put into the garden to dress it. Infidelity thrusts him out. Old faith refuses to touch the tree of the Lord's planting. Both extremes are foolish. We would merely put the pruning knife into the gardener's hand, and tell him to use it freely, for the vine will not bear good fruit otherwise. Christianity wants pruning—The Christian has not spirit to do it. The Infidel thinks it not worth doing. Hence both are inefficient. We must have patience till wiser men appear.

REMARKS ON THE ARTICLE FROM *BLACKWOOD*, IN OUR LAST.

WE branded the article above alluded to as disguised infidelity, not because we believe the writer himself to be an infidel, for we have no authority to judge the hearts of men, but because a writer could not more effectually serve the cause of infidelity than by writing in such a strain. Neither are we at all afraid of infidelity, any more than of Church faith, that we should lend a hand in stemming the current. The infidel would certainly not be less attentive, than our Christian clergy, to the moral and intellectual culture of the people. He would not work up their nervous fears and mysterious hopes so high, but he would certainly attend to their alphabetical instruction, and give them the means of acquiring useful knowledge, and also of indulging in any mystical science, to which their natures inclined them. He would leave the press at liberty to sift the whole contents of Nature, and establish the censorship, not in Somerset-house, or in the houses of Parliament, but in the moral sense of the people, which is, as this country has now, within these last ten years, demonstrated, the most powerful check upon extravagant opinions, and outrageous language, which has ever yet been attempted. Let mind have free scope, and truth, which is the prize for which the race of human life is run, must ultimately be found. The contest with error ought rather to be sought than avoided, for the sooner the battle is engaged in, the sooner will the victory be won.

The writer in *Blackwood* assumes a principle, and then uses it as a test. He assumes that the Mosaic account of creation is a literal unmythified history, and then impiously declares, that if it be not a history, the whole Bible is false. We mean to act as counsel for the Bible, and deny the inference. Whether the Mosaic account of creation be allegorical or historical, we shall not at present affirm; we regard it as allegorical, prin-

cipally, although we do not deny that it may be partly literal; but we say that a careful distinction ought to be made between the historical and the revealed portion of the Bible. The Bible history is merely the production of simple-minded men, evidently without craft, and innocent of any popular design. The prophetic parts are specimens of rapt enthusiasm, containing visions and dreams of such characters as Montanus, Mahomet, Joan of Arc, Maximilian Daut, Seth Darwin, John Lacy, Jane Lead, James Cunningham, Richard Brothers, Joanna Southcott, George Turner, John Wroe, and others, in all ages, who have written in the same strain, by a particular species of inspiration, which generally belongs to the poor and unlettered, and is peculiarly elevating to the simple mind, and consoling to the downcast and sorrowful. These latter characters always speak in mystery. These are prophets, which have always been, and, probably, always will be, as they belong to the economy of Nature. They speak in allegory; they use similitudes, emblems, and symbols. Their language is not to be interpreted according to the rules of literary criticism, nor their meaning by the rules of common speech. They are not historians, and when they foreshow the future, or allude to the past, they clothe both in the mist which is peculiar to their caste.

Moses was one of those characters, and where did he obtain his information of the creation? From Revelation? Then treat it as Revelation. What was the law but a *shadow of good things to come*? What was the Aaronic priesthood, that was to endure for ever, but a type of something more substantial and more enduring? What, in fine, was the legislative work of Moses as a whole? a vapour which has been blown away, and only remembered in history and tradition. If the law itself was a shadow, why should the revelation of the creation be a substance? But, says the writer, "here is the Fourth Commandment asserting it as a fact." The writer knows very little of revelation, if he imagines that it would contradict the traditions and historical records of nations, even supposing they were false? Is not the Providence of God directing traditions and histories, as well as revelations? Are they not a part of the great plan? The seventh day is a day of rest, and ordained by God to be a day of rest over all the world, and he has implanted in man the conviction that it was so ordained, because the creation was finished on the seventh day; but whether that creation be the material, geological creation, or the spiritual creation in allegory, remains yet to be proved. Perhaps, it is partly both, and the real truth concealed in dark sayings, to exercise the ingenuity of man. It has been the favourite method of teaching wisdom, in all ages, to clothe valuable lessons in mysterious expressions. Proverbs are all dark. King David speaks of "the words of the wise, and their dark sayings." The Greek philosophers cultivated this mode of speech to conceal their thoughts from the vulgar mind, and the orientals have always been pre-eminently remarkable for it. We still discipline children in a similar manner. It is a law of Nature. Can it be wonderful, therefore, if, in the youth or infancy of society, the spirit of Nature should have propounded mysteries? Who is he that maketh the day dark with night, but the same that maketh the night light with day? He who concealeth the sun at midnight, is he who causeth it to shine at noon.

There is no proof that the first chapter of Genesis is a history. It is a tradition, most probably, and probably a revelation; but in either of these cases its literality cannot be depended upon. No evidence can prove the truth of the letter—no human testimony can be brought, for man was not in being to witness the fact, and *revelation is a mystery* not amenable to the ordinary tribunal of letters. The history of Moses is very different. That is the history of a people, written by their leader, and preserved by his followers, with a few comments superadded, of a geographical or chronological character. The history of Abraham is tradition; the story of the flood is also tradition, and subject to the laws of tradition. Nor does any inaccuracy in the traditional narrative invalidate the authority of Moses, or belie his divine commission. We would regard the mission of Moses and Christ as divine, though the history of the flood and of creation were mere inventions of the children of Ham, and picked up with the stubble, by the children

of Israel, when they made bricks for the king of Egypt. Moses was justified in giving the cosmogony of the world, as he received it from his predecessors, without concerning himself with its historical accuracy. Let human science find that out. It is beclouded, on purpose to exercise our minds. But why should we be afraid of contradicting Moses? Moses would only laugh at us, if he saw our silly fears. Why should man be afraid of calm investigation? A spirit of bigotry he ought to fear, but a spirit of simple inquiry is a divine spirit, to whatever conclusion it come, and will be justified by the father of all spirits. We would rather be the man who boldly yielded to the demonstrations of science, independent of Moses, tradition, or visionary and mystical revelation, than the slavish and fearful fanatic who adopted a fact merely because Moses penned it—though Moses himself was debarred from entering the land of promise, for the mistakes which he committed.

What is the revelation of St. John, or the prophecy of Daniel, but a prospective history, in which men and kingdoms are symbolized as dragons, beasts, and horns, with many other fantastic images?—why should a retrospective revelation follow a different rule? Is not God the same yesterday, to-day, and for ever? and are not the laws of revelation the same for the past, as they are for the future?

As for geology, there can be no doubt it is an infant science, but less so than many other sciences of observation. Even chemistry itself, the most practical of all, we have heard Dr. Faraday repeatedly declare, is destined to undergo a radical revolution. Astronomy, the most perfect of all, is full of hypothesis. In fine, all the sciences are awaiting a great crisis, which must transform all the opinions, creeds, and social institutions of society. The world has not yet arrived to puberty.

There is one simple fact, which must for ever involve the literal meaning of the Mosaic account in doubt, and that is the creation of the Sun on the fourth day. Moses himself was a man of discernment, not a simple fool; he was the leader of a people in times of difficulty—he could not be blind to such a palpable contradiction as this, and therefore, it is probable that Moses himself regarded the revelation, supposing it revelation, and not tradition, as having some figurative or allegorical meaning. The traditions of the Jewish church have allegorized it long before geology had a being; and St. Paul himself, in his spiritualization of the law, and even of the history of Abraham, has shown us that the letter is subservient to the spirit; that the word of God has a prospective meaning—that revelation is not a mere statement of occurrences in time, but of states of being in eternity, and employs history, tradition, fable, and vision, as a vehicle, without condescending to arraign them before the tribunal of literary criticism.

Until this be acknowledged by Christians, infidelity will abound, for there can be no denial of the literary inaccuracies of the Bible—but the inspiration is not in the Bible, it is in the mission and in the Church—and we cannot have a final court of appeal for divine truths till the Church be organised, and its doctrine and its works be subjected to the voice of God in the sum-total of its members. "The plenary inspiration of the people" is our motto—which we hold, in company with its counterpart, "the degeneracy of individuals and sections of the people."

STUDENT'S LETTERS.

ANOTHER letter from "A Student" has come to hand, containing a condensed cosmogony, which is all that we can find space for at present; particularly, as it reaches us accompanied by a contrast, or paraphrased commentary, which, to be well understood, must appear with it. We will not be bail for its being understood now, but both writers hold themselves ready to explain further when called upon. Acting the part of literary door-keepers, we cannot think of denying admission to respectable parties, merely because they present an unusual physiognomy.

Questions and Answers for the New Catechism of Progressive Religion.

- Q. What is the end of all human institutions?
- A. Happiness in peace and security, through civilization.
- Q. How can civilization be diffused?
- A. By increasing human sensitiveness.
- Q. How can we increase human sensitiveness?
- A. By diffusing mental development or understanding among all classes.
- Q. How can we increase mental development?
- A. By increasing the quantity of intellectual impressions on the human brain, through its union with our external senses.
- Q. Why through that physical union?
- A. Because the grand end of the free union between the human brain and the external senses, appears to be a progressive increase of happiness and civilization through a succession of impressions, or through progressive knowledge.
- Q. Are the brain and the external senses two different means of promoting civilization through knowledge.
- A. No: they are one; so much so, that the external senses are null when deprived of the functions of the cerebral mass—the seat or centre of all sensation.
- Q. Can the external senses be partly deprived of the cerebral functions?
- A. Certainly; and such is the case whenever man is left alone without the means of availing himself of the mental modifications time has operated on the species, through impressions made on all past generations, and recorded by them.
- Q. What, then, is the result of that union between the brain and the external senses?
- A. When partly deprived of the functions the brain is capable of performing, the impressions produced by the external senses are then instinctive rather than perceptive and reflective; or, it may well be said, animal rather than intellectual.
- Q. What effects are usually produced by an early exclusive mystic instruction?
- A. The tendency of an early mystic instruction is decidedly to call into action the instinctive faculties of the brain only; never the perceptive or reflective ones.
- Q. But has not civilization progressed under mystic tuition?
- A. Certainly, but never beyond a certain extent; because such tuition brings man under the influence of his animal instincts, and deprives him for life (generally speaking) of the free use of the intellectual functions of the brain; when it is through the latter only, that knowledge and civilization can proceed onwards beyond the sphere of thoughts or feelings generated by mysticism.
- Q. How, then, can society advance in civilization beyond the mental deficiency for progress inherent in mystic religions?
- A. To redeem mankind from this mental deficiency intellectual education must supplant entirely everywhere, and first of all in all churches, the mystic instruction still so much insisted on by the short-sighted or interested priesthood. Then only will the people enjoy the free use of the organs they all possess. This is the religious reform that should have precedence over all other civil ones; and, therefore, now the one thing needful.
- But the people must be made to understand, and to feel, that the spirit of inquiry after real knowledge, is a continuation of the religious spirit of blind faith in occult knowledge or mysticism.
- That all forms of worship pass away, whilst the religious spirit progresses.
- That it is those forms only in religion or education any one can presume to reform, since the spirit of reform is itself a religious spirit.
- That education and religion are one in spirit, and eminently progressive.
- That the mental want is a moral want, and the desire for more knowledge the manifestation of a progressive religion.
- That, to diffuse more knowledge, is in reality diffusing more understanding.
- That, to diffuse more understanding, is in reality to diffuse more active morality or virtue.

That, to diffuse more understanding, morality, and virtue, is in reality to diffuse more happiness through civilization.

A STUDENT IN REALITIES.

Questions and Answers for the new Catechism of Progressive Sensitiveness, and Enquiring Conscientiousness.

- Q. What is the end, to the human being, of all rightly administered human institutions?
- A. Happiness.
- Q. What is to secure the end in the human bosom, when it is attained?
- A. Conscientiousness.
- Q. How are human institutions to be rightly administered, to produce the end intended in the human being?
- A. By using all such means as will tend to increase the human sensitiveness, and dispose it to be elevated, by free union with the spirit, into conscientiousness.
- Q. How can we check conscientiousness?
- A. By diffusing mental development, or scientific knowledge, among all classes, for a self end. By increasing the quantity of intellectual impressions, and connecting them, through the senses, with the animal brain.
- Q. How can we procure and increase conscientiousness?
- A. By submitting the human spirit to a union with the divine. By a free union of every human end with the divine end.
- Q. Why through free union with the spirit?
- A. Because the grand end of the free union between the human being and the divine being, appears to be a progressive increase of conscientiousness and usefulness, through a succession of progressive relations, and through a progressive substantiating of the same.
- Q. Are the human spirit, and the divine will, two different ends, that must concur in engendering and securing a conscientious happiness?
- A. Yes, they are to become one, so much so, that the human spirit, so far as it is not related to the central spirit, the all-conscientious centre-seat, is null with respect to enduring happiness; and so far as it is united, the central spirit secures the conscientious enduring happiness.
- Q. Can the internal faculties be partly obscured and deprived of the spiritual functions of the spirit by artificial scientific culture?
- A. Certainly; and such is the case whenever man is exteriorly hindered from availing himself of the spiritual modifications which the spirit is operating through conscientiousness, and which it has operated on all past generations, as is historically recorded.
- Q. What, then, are the results of that disunion between the internal faculties, and the spiritual functions of the infinite spirit?
- A. When partly deprived of the functions which the spirit is capable of performing, the impressions produced within by the external senses, from artificial scientific culture, are rather animal than spiritual; or it may well be said, sensuous rather than conscientious.
- Q. What effects are usually produced by an early, exclusive, artificial, civilized instruction?
- A. The tendency of an early, artificial, scientific instruction, is decidedly to call into action the sensuous faculties of the finite human spirit, never the creative functions of the finited infinite spirit, which produces conscientious enduring happiness.
- Q. But has conscientiousness retrograded under artificial, scientific, civilized tuition?
- A. Certainly, to a fearful extent. Because such external tuition brings man under the influence of his sensuous instincts, and deprives his spirit, for life (generally speaking), of the free use of the functions of the finited infinite spirit, when it is, through its functions only, that conscientious happiness can proceed upwards beyond the sphere of the thoughts, or of the feelings generated by the senses.
- Q. Can society advance in conscientious happiness, if it

progresses by a scientific culture only, within the intellectual boundary?

4. Most assuredly not. To redeem mankind from this mental bondage, this conscience—death, the creative functions must supplant entirely, every where, intellectually scientific education, and first of all in the scientific institutions, and also the verbal mystic instruction in all churches, still so much insisted on by the short-sighted and institutionalized priesthood. Then only will the people, from a free union with the creative spirit, enjoy the conscientious happiness they are constantly impelled to seek. This is the personal reform that should have precedence over all other religious ones, and, therefore, now the one thing needful.

But the people must be made to understand and to feel that the spirit, which generates conscientiousness, has been clouded by a blind faith in mysticism, and by scientific knowledge for self ends.

That all forms of worship pass away, whilst the creative spirit always progresses in producing a conscientious enduring happiness.

That it is those forms only in religion, or education, that any one can presume to reform, since the spirit itself is unchangeable.

That the spirit, in itself one, lets education and religion act as they may for a season, while it progresses eminently in conscientious happiness.

That the spirit which engenders mental want and moral want, and conscientious desire, is itself properly the food of all these wants.

That the spirit which infuses conscientious happiness, is, in reality, infusing more activity to morality and to virtue.

That the spirit which infuses more activity to morality and to virtue, is, in reality, infusing more understanding.

That the spirit which infuses more internal activity to virtue, to morality, and to understanding, is, in reality, diffusing more security, more conscientiousness, and more happiness!

A STUDENT IN DIVINE REALITIES.

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Franson, late *Pupil of the Polytechnic School, and Engineer of Mines.*

(Continued from page 157.)

PASSIONAL EQUILIBRIUM.

The means proposed by M. Fourier for establishing a harmony of interests, and maintaining the general concord, form a systematic whole, all whose parts are intimately connected.

I have made known, in my preceding article, the plan of social mechanism, a plan unique and universal (the formation of *passional series*), a principle truly prolific, by the aid of which M. Fourier attacks, with success, the most arduous difficulties, and the employment of which, having nothing arbitrary, elevates the theory of association, to the rank of a *FIXED SCIENCE*.

There are many conditions essential to the establishment of social unity, conditions easy to fulfil, by the application of the system of groups and series to a union of three or four hundred families, and whose realization will satisfy the desires of every true philanthropist. Amongst these conditions, it is necessary to class, in the first rank, *Industrial attraction, the whole minimum* (of food, clothing, and lodging), and *universal education* (*unitaire*).

1st. I have already insisted on the importance of the first condition, the necessity of creating industrial attraction. Until then, all real progress towards association is impossible, since those, whose more fortunate position relieves them from the necessity of producing, will confine themselves, as long as labour is a punishment, to the class of consumers. We congratulate ourselves on having uprooted the prejudice which subjected the interests of industry to the interests of war, and which despised the arts of peace; but what has been the true nature of this progress? that is to say, in what manner have the superior classes taken part in the operations of industry? Have we seen them working in person, entering the workshops and learning the arts? By no means; they have not been engaged in industrial enter-

prises, but with their capital only, leaving to the people the whole care of multiplying their money. They have only reserved to themselves the most agreeable employments, such as direction and negotiation. This evil has been deeply felt by the Saint Simonians, who exclaimed against the idleness of capitalists. But the Saint Simonians were ignorant of the means of making idleness disappear. The rich, says M. Fourier, have good reason to love idleness, since it presents to them nothing but labour, revolting by its monotony and the length of its periods, &c. Still more may be said, namely, that every doctrine, every political measure which professes to ameliorate the condition of the masses, without transforming their labour into pleasure, will only give an additional stimulus to idleness. This observation of M. Fourier appears to me to go to the root of the evil. That, in fact, for a disagreeable, a brutalizing species of labour, there is no possible vehicle, but hunger and misery, unless it be the lashes which they give to slaves.*

2nd. The possibility of guaranteeing to the poorest associate a minimum of lodging, clothing, and food, and even of pleasures, as the privilege of hunting or fishing, entry to the theatres, &c. This possibility rests, as I have already shown, upon the creation of attractive industry. That which is of importance to mention here is this, that a guarantee of the minimum is necessary for the fusion or communion of all classes. It destroys the temptation to robbery, which, indeed, would be impossible in an association where the use of the object stolen would be impossible. It is a security to the rich, that all their co-operators in industry are free companions of pleasure, attached, like themselves, *by passion*, to a common labour. It alone, in fine, can procure the people true liberty; for, as long as people are exposed to the danger of falling into indigence, they cannot make a free choice of their occupations. If they have public rights, they will be apt to sell them, as they did at Rome, and as they now do in England. In a word, they will become a prey to all the seductions with which the rich would surround them.

3rd. Though these two first conditions were fulfilled (industrial attraction, and graduated minimum), association would still be impossible, if diversity of style and manner amongst the extreme classes prevented, as now, their union. Universal education—education given collectively to all—can alone prevent this inconvenience. "General politeness, and unity of language," says M. Fourier, "can only be established by a collective education, which gives to the child of the poor man the manners of the rich. If *Harmony* had, as we, instructors of different degrees for the three classes, academicians for the great, schoolmasters for the middle classes, and *dominies* (*magisters* (?) magistrates) for the poor, its fate would be the same as our own; a separation of ranks, and distinction of manners, which would

* M. Fourier remarks very judiciously, that beyond a certain degree, the increase of wages would produce among the people, who, already make a holiday of Monday, a cessation of labour, for two or three days in the week, as in Spain. For which reason the progress of the people by elementary instruction will always meet with opposition. Without doubt, education gives to working people habits of order and economy; it is not we, who blame the exertions which we made to spread it. But education alienates the people from industrial labour. Here is a recent fact which proves the truth of his assertion. At the commencement of the last legislative session, M. Arago proposing a reform of schools of arts, and of trades, complained that the young pupils in the schools had no taste for the employment of industry. He repeated a saying well circulated in the workshops, respecting the students of Chalons; "*These are the gentlemen who are afraid to soil their fingers.*" What conclusion can we draw from this? will people pretend that working men ought necessarily to delight in uncleanness? or will they not rather see one of the thousand examples of the vicious circle, in which society is at present involved, not being able to bring forward two perfections at once. Does it wish to perfect industry; it brutalizes the workman by the division of labour, not knowing how to add to this division employment in short sittings. Does it wish to perfect the workman? The workman soon revolts at labour, and he has good reason.

be gross with the poor, pitiful with the middle classes, and refined with the rich. Such an effect would be a pledge of universal discord; it is, then, the first evil which the harmonian policy ought to avoid, and the prevention is secured by a system of education, which is *one* for the community and for all the world, and which establishes every where the unity of good manners."

Besides, education has, in the theory which we now attempt to illustrate, a character absolutely new, and which will suffice to distinguish the social order from all that has hitherto been imagined. This is what the reader will soon perceive, if, in the first place, he give a little attention to the principles upon which M. Fourier establishes the *passional equilibrium*.

Having laid down this fundamental conception, that *impassioned attraction* is the only law of the universal movement, the only law of the social movement, it would not be sufficient for M. Fourier to bring out of the plan of association, which gives development to attraction, some brilliant advantage, like the three general conditions which we have just examined. It is necessary still, by a methodical exposition of the movement, to justify attraction in all its effects.* It seems to me without doubt, that, on the first view of the advantages of association, true wonders, of which I have been able to give only a very faint idea, but which M. Fourier has described with a power and richness of imagination inexhaustible, it seems, I say, that, in order to realize so much good, every one would be disposed to make as large a sacrifice as possible of his passions—if, for the establishment and maintenance of so beautiful a system, this sacrifice were necessary. Have not all philosophers and moralists taught us that man ought to abandon some of his natural rights, in order to enjoy the advantages of society? and, if such a principle has been taught, and admitted in societies where the greatest number partake of nothing but misery, who, then, would not strive to put it in practice, in order to procure the establishment of an order of things, which, by its own nature, would guarantee to the lowest of men a comfortable existence, and the full development of all their faculties. But the realization of this social order, requires no species of sacrifice; and here it is easy to see that M. Fourier is master, in all its details, of the vast plan which he has traced out. As he has, in the first place, presented a regular analysis of the *passional system*, so he addresses himself to prove that so far from embarrassing the movement, each one of the passions becomes an essential spring of mechanism, and furnishes the most powerful means of union amongst classes and ages which now appear to have naturally the strongest antipathies. And since this proof depends on the constant application of a fixed process (regulation by series), we must confess that the author had reason for announcing, in 1808, the discovery of a new "*science exacte*," the science of the social movement.

That what are called the sensitive passions may be made the pledges of harmony, in proportion as they are more developed and more refined, is what appears to me very strictly demonstrated by all the details which M. Fourier has given upon the material organization of the "*Phalanstère*." Whatever may be the importance of these objects, I cannot but point them out, in order to attest the regularity of the theory.

This regularity shines conspicuously in the treatise on the "*équilibres cardinaux*," cardinal equilibria, or *passional combinations*, furnished by the four affective passions (Treatise of Domestic Agricultural Association, vol. ii. p. 477); and it is here that we find ourselves all at once, and in an unexpected manner, recalled to the important question of education.

In fact, the four affective passions do not exercise an equal influence over all ages. The infant is ignorant of love and

familism; ambition is little developed within him; in a word, his true passion, until the age of puberty, is friendship. Love reigns over youth; after that comes ambition; and then the last period of life concentrates all the affections in the family circle.

It follows, then, that a social order, which professes to find its strongest support in human feelings, must rest at once upon the four phases of life. And since, for example, friendship is most active in infancy, since it is then more disengaged from every personal interest, infancy, by this alone, becomes as indispensable as any other age to the social mechanism; in fact, the intervention of infants is, in domestic agricultural association, one of the strongest securities of the general harmony. But let us stop an instant at this first consequence, to know, that, in the theory of M. Fourier, education ought naturally to go on in the midst of the social movement.

This is excellent; and this simple idea, it appears to me, ought to constitute, with every serious mind, a very strong presumption in favour of *social theory*. What a noble testimony in favour of a social order, to be without danger for infancy; moreover, to rest itself upon the virtues of an age, which knows, as yet, nothing but truth, justice, and attachment.

And how must such an order of things appear desirable, if we give attention to the destiny of infants in modern society! The *perfection of industry* permits civilization to employ the children of the common people! Civilization makes use of the children of the people! Listen! Mr. Huskisson, Minister of Commerce, said, in these, his own words, to the House of Commons, February 28, 1826:—"Our silk manufactories employ thousands of children, who are kept to their task from three in the morning till ten in the evening. How much do they receive per week? One and sixpence for labouring nineteen hours, watched by superintendents, armed with whips, with which they strike every boy who stops an instant." And believe not that real improvements have ever been brought to a discipline so horrible. A short time since, a daily journal (the *Times*) described the frightful destiny of women and children in the English factories, and it acknowledged boldly that the present organization of industry maintained, *de facto*, *slavery*, in the midst of civilized societies. But, cries one, let us have one or two such revolutions as that of July, and we shall be able to guarantee to all children *elementary instruction*. We will open the central schools, &c. Very well. I know the good wishes and devotion of those who form such projects; and, therefore, I feel assured that they will be seized with a lively enthusiasm in seeing in the book of M. Fourier, how, by the simple fact of association in domestic agricultural labours, it is possible, in the first place, to support the parents, and afterwards, to procure for all the children a *COMPLETE EDUCATION*, an education forming at once the heart, the body, and the intelligence; in a word, an education superior to that of the highest classes of present society, since the most simple phalanstère, substituted instead of a miserable village, will unite all the examples of practice to the lessons of theory, possessing, with workmanship and culture of every variety, all the resources of science, such as library, observatory, medical and chemical cabinet, collections of natural history, &c.*

All these things, of which I here speak in a general manner, are illustrated in the work of M. Fourier, with the greatest detail. Education is treated *thoroughly*. Nothing is left in obscurity. Every thing is so definite as to leave no doubt of the possibility of realizing such fine promises. I confine myself to the statement, that *childhood* furnishes, by its intervention in the operations of the social domestic establishment, one of the strongest ties of association—one of the strongest bonds of union.

Passional unions are subject, like all the details of the theory of association, to fixed rules. M. Fourier shows, that in harmony, each of the affective passions produces four distinct combinations, and lays down as a principle, that

"Every equilibrium, of friendship, love, ambition, familism, depends on the internal co-operation of its four motives, and the external influence of three other combinations, balanced, in like manner, by a fourfold motive.

"The combined intervention of these four QUADRILLES o

* Have I occasion to observe that he does not attempt to justify the errors into which man is drawn by his passions in the present order of society. M. Fourier has anticipated, under this view, every objection in admitting, with unity of movement, the principle of duality of development, and in acknowledging very explicitly that in the *subversive order*, the piecemeal system, (*regime morcelé*) the christian law which commands man to suppress his passions is infinitely wiser and superior to every other.

agreement, produces the PIVOTAL or UNITARY equilibrium, which is the collective end of association."

It is impossible for me to enter into the detail of the combinations of friendship, any more than into the details furnished by the three other affective passions. It suffices that I give the reader an opportunity of appreciating the sum total of M. Fourier's social system; but I give, in a note, some quotations relative to these combinations, quotations which will sufficiently prove, that, in spite of the apparent difficulty of his subject, the author is always master of it.

* This does not exclude the benefit of capitals of provinces, and empires, where individuals the most distinguished, wld go to be perfected by the lessons of the most celebrated professors. We speak only, in this analysis, of the simple domestic establishment.

† "AMBITION, the most redoubtable of all the passions, that which is particularly loaded with the maledictions of the philosophers. What a pity! that at the epoch, when God created the world, and the passions, there was not some philosopher at hand to whisper—"Eternal, would you balance the universe in wisdom, according to the dictates of sound morality, create worlds without ambition, worlds in which men despise all riches, and love nothing but black broth, and metaphysical abstractions. These are the paths of true holiness, apart from ambition. This, eternal, is the manner in which thou oughtst to organize worlds, to render thyself worthy of the fair reputation of a philosophical creator." It is probable that God would have yielded to these sage councils, and that he would have created all of us enemies of ambition, despisers of greatness, &c. But since God, in his creations, has not been assisted by the light of philosophy, and since he has irrevocably subjected us to ambition, let us consent to study the methods which he has adopted to make this passion a lever of high social harmony.

"To reconcile all men by the mediation of this ambition, which incites, at the present time, to so many perfidies and thefts! the task seems frightful, and we shall have, on this subject, a principle quite new to establish; it is, that civilized men, even the most insatiable of power, have not a fourth part of the ambition necessary in the social order."—(V. il. p. 179.)

"LOVE, the most rebellious passion to the systems of the moralists—Love begins to figure amongst our young people as soon as they have attained their fifteenth or sixteenth year. How subject them in the affair of love to the decencies of social harmony, how fashion them thereto BY ATTRACTION, so that the gay and the ardent, disengaged from the restraint of laws, shall unite with heart and soul in the measures of social unity and universal concord?"

"In the observations which precede, I have refuted the systems of education, which cannot employ, to advantage, the natural impulses of infancy. Here their authors hope to take their revenge. "Let us see," say they, "how your theories, giving early emancipation to young ladies, will be able to secure them from going astray. You pretend to make use of every natural impulse. We take you at your word. Tell us how the young girls of the phalange, free to give a blind obedience to the laws of attraction, will be able to preserve a conduct satisfactory to their parents, and consistent with the preservation of public morals. Now, no evasion: fulfil your promise entire, of harmonizing all the passions by attraction only. Here is one of the most untractable. Love, especially in youth, is at war with all the usages of society (civilized and barbarous). But employ your learned counterpoise of compound and bi-compound series, and, without using any constraint, show us how you bring free love to a perfect coincidence with the two authorities, administrative and paternal, in all that respects interest and morality. If you founder upon this problem, depend upon it we will not believe in the possibility of your preceding equilibria, and that, by anticipation, we must regard as doubtful those which you announce for the following sections."

Agreed; I accept the challenge without reserve, how rigorous soever the conditions may appear. But, in the first place, let us throw a glance over the feats of our own legislation in this respect.—V. 2, p. 290.

"FAMILISM.—One of the effects to be produced in the circle of paternity, is the free love of the heir, the sincere desire of prolonging the life of the testator. There is scarcely any thing in civilization more disgusting than the secret feeling of legatees towards their benefactors. The present system puts affection and interest at variance. It is clear, that nine-tenths of heirs listen only to the voice of interest, and wish a speedy departure to him whose inheritance they expect. On the other hand, civilization accustoms every parent to forget every sentiment of philanthropy and charity to establish his direct lineage, and to see the social world only in this union of children, and frequently in an eldest son only, to whom he sacrifices the younger sons and the daughters. The family union ought to remedy this double depravity of parents and children—the problem is, "to establish between testators and legatees, whether consanguineous or adoptive, an affection so lively, that the heir shall desire to prolong the life of the testator, whom he is now so impatient to conduct to the tomb."—(New World, p. 393.)

(To be concluded next week.)

ENDOWED RELIGION IN HUNGARY.

THE Catholic Church is very amply endowed, more so, we believe, than in any other country in Europe; and its prelates, by means of their wealth, possess great influence both in the Diet and in the county congregations. It is under the direction of three archbishops and sixteen bishops (besides four bishops of the United Greek Church), whose united revenues, principally derived from landed property, have been computed at £200,000. There is, however, a very great disparity in the revenues of the different sees. The archbishop of Gran (Eastergom Strigonium), who is also primate of Hungary, with the title of prince, is in the enjoyment of £60,000 per annum.* The other prelates have from £1,000 to £10,000. Besides these dignitaries, there are upwards of a hundred titular prelates, and a numerous body of canons, abbots, &c., some of them with very considerable incomes.

* This is said to be a very moderate estimation; still, if we consider the cheapness of living in Hungary, it would go as far as £150,000 in England!

There are two ways of gaining a man friends; first, by praising him moderately, and, second, by reviling him outrageously. There are also two ways of gaining him enemies; first, by reviling him moderately, and, second by praising him extravagantly. Be moderate both in praise and blame; there is a spirit of reaction in man, which resists extremes in others, even those of which itself is guilty.

Union is stronger than number. Twenty men, under the discipline of one, are stronger than ten thousand in disorder and insubordination.

TO CORRESPONDENTS.

W. B.—We see no reason to retract a syllable of what we wrote in reply to W. B.'s former letter, nor can we find any thing in his last which controverts our declaration of the supremacy of the living spirit in the Church, over the letter in the book. The book is of no use to a dead man, neither is it of use to one who cannot read, because neither of these two have got the reading and understanding spirit within. It is this living spirit which is Lord of the book, which actually puts a meaning upon the book. W. B. misunderstands us, however, if he thinks we set up the light within independent of the book. Far from it. The book is a record of past experience, and, as the memory of an individual's past life is of use to direct his future conduct, so also is the memory of the church or society necessary to correct the follies of natural impulse, when not

directed by the wisdom of experience. We use the book, but regard the Church as the interpreter of the book, because the book is not alive, and cannot expound itself without a living spirit to read it.

We do not regard the common cant of appeal to the law and the testimony as having any authority in doctrinal matters. When the law is so clear that there is no controversy about its meaning, then the spirit of the collective church has settled the question; if a thief has stolen a sheep, and the law says he must restore fourfold, the law is plain, because the spirit of interpretation in man says it is plain; but when the "word" talks mystically and metaphorically about faith and works, heaven and hell, election and reprobation, &c., the spirit in man says it is not plain, and when the spirit in man says so, the appeal to the book is vain. Yet one party says it is plain in this sense, and another says it is plain in the opposite sense; where, then, is the authority? Here are two opposite spirits of interpretation. One party has as good a right to affirm as the other to deny; each quotes the book, and each is convinced, sincerely convinced, he is right. In this case we say there is no appeal, except to the Church collective, whose verdict must always be right, for the age in which it is given, for it is in harmony with the condition of the mind of society. This universal sense of the Church is what we mean by authority. It is the highest court of appeal. It is the dominion given to man by the creator, by which he acts in co-operation with God, as a son. He exercises it by means of his reflective and judging faculties. God has made him a reflective being, and any inspiration which does not employ the reflective faculties which distinguish him from the brute creation, is merely a spirit of delusion. Religion has hitherto been, to a great extent, subversive of reflection and free inquiry. In so far as it has been so, it has been a delusion, that delusion which God himself said he would send, as long as men refused to obey the truth, that is, the the glaring truth which stares at every man within, but which the slavish fear of a false interpretation of the words of revelation forbids him to obey.

We are sorry to hear our correspondent say Christians need no plan. Does he trust to mystic without scientific inspiration? We are happy to know that the wisdom of God will never dishonour the rational being he has created, by suffering such inspiration to lead to any thing but fanaticism. Every species of inspiration is divine. They must all be gathered, like the Church, into one fold. They form each a check upon the other. Each is a delusion separately. It is the union of inspirations which brings forth the final truth. This is the gathering of Israel, the Church of the first-born, to which the promise is made, and by which alone the kingdom of God can be established upon earth.

STUDENT'S LETTERS.—The *Shepherd* is a little arena for several contending parties, with which we wish to preserve a friendly relationship, and for whose bloodless warfare with existing evils we have already made considerable sacrifices, in the hope that some benefit might accrue from the conflict of mind, to which we have afforded an opportunity. We beg the reader, however, distinctly to understand, that we have no other relationship with the articles inserted, than that of friendship and respect for the authors, as men of intelligence and enthusiasm in the great cause of moral regeneration. We feel, already, so firmly fixed in mind upon the means of moral reformation, and these means are so exceedingly simple, that the greater portion of what we read about education seems to us to be a shower of sand, more calculated to put out the eyes of men, than to give them any information, or clarify their perceptions. Our first Student's Letter insists upon knowledge as the regenerator; this, we can positively assert, from manifold observation, will not do. Even amongst our own personal acquaintances, we can point out men of great mental powers, and manifold accomplishments, who are marvellously deficient in moral sensibility; mere children, in respect to the rules of propriety, and infinitely lower than children, in respect to animal propensities and irresolution—men who can talk eloquently of sobriety, and then sink into a sleep of intemperance and drunkenness—men, who

will pass the highest encomiums upon virtue, and then launch for enjoyment into the opposite vice. Mere knowledge will not suffice. Besides, knowledge is comparative; and if the lowest human being were himself a Newton, whilst the highest is as far above him as a Newton is superior to the most illiterate gin-drinker, that very Newton in the lowest rank would himself be a gin-drinker, if the present relationships of society were preserved, and the same infamous partialities and oppressions committed. Still, we believe, that a refined intellect is a moral intellect, and, therefore, are not far from agreeing with a "Student in Realities."

"A Student in Divine Realities" has a lever in his hand, without a fulcrum to rest it upon. We acknowledge the power of the lever, if he could obtain what mechanics technically call "a purchase." We deny the possibility of mere moral, or spiritual, or any other useful education, independent of political condition. On the contrary, we believe that such an education would increase the amount of crime, although it would alter its character. The more sensitive a man's moral nature is, the more he must revolt at the malpractices of society; and as these malpractices are consequences of political measures, or social institutions, he must lose all respect for, and cast off all allegiance to, external government, as soon as he regards it in the light of the author of moral wickedness. Place such men in certain circumstances, into which many would necessarily be thrown, and, instead of pickpockets and thieves, you would have cunning craftsmen, moral casuists, exercising their improved perceptibility in working the rules of conscience to accommodate the changes of their fitful and eventful lives. People in easy circumstances cannot judge for the wretched poor. We have often seen the sober, and the innocent, and the intelligent, starving, and the children even quaking with anxiety about the next supply of bread; and we have cursed in heart all intellectualists, and moralists, and spiritualists, and tract distributors, and preachers, all *en masse*, as mere closet philosophers, who ought to have twelve months' experience of *genuine* poverty to teach them wisdom. Give us the man who will, in the first place, like Owen or Fourier, provide at least the minimum of subsistence, and secure it for all, and we will listen to his further plans. This is the first step of education—material food—the ornamental is the superstructure, the very top of the building; and as no mason builds the chimney-tops first, and the cellars afterwards, and finishes with the foundation, so no true teacher of man will begin with the end, and finish at the beginning. Much of the language of "A Student in Divine Realities" is unintelligible. We do not see the use of such an expression as "the finited infinite spirit." Why not "infinite finite," or "finited eternalized and timeated spirit," or "spirited spirit?" We call this pedantry, and it invariably defeats its own ends. It is another species of that very intellectualism which our correspondent condemns.

A system of education which depends on the proselytising of individuals, and which secures its end only by perpetually "rating" poor creatures for yielding to this or that impulse of nature, rests on a poor foundation—it is rowing up the rapids, and will only serve as a laughing-stock for those who propose to conform the institutions of society to the impulses of eternal nature, and ride down the stream. In saying so, we beg to observe, that crime is merely a temporary phenomenon, occasioned by the political condition of the individual. Man is naturally disposed to virtue; society is artificially adapted for vice.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*
"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND,"—*Bible.*

No. 22, Vol. III.]

SATURDAY, NOVEMBER 25, 1837.

[PRICE 1½d.]

A SHORT ESSAY ON THE BREEDING OF GENTLEMEN.

Up with me, up with me, into the clouds!
For thy song, lark, is strong;
Up with me, up with me, into the clouds,
Singing, singing,
With all the heavens about thee ringing:
Lift me, guide me, till I find
That spot that seems so to thy mind!
I have walked through wildernesses dreary,
And to-day my heart is weary;
Had I now the wings of a fairy,
Up to thee would I fly.
There is madness about thee, and joy divine,
In that song of thine:
Up with me, up with me, high and high,
To thy banqueting-place in the sky!—*Wordsworth.*

ALMOST all men of education and reflection, and many without either reflection or education, have some tolerable idea of the art of breeding cattle and horses. They know that much depends on the sire and the dam—that a pair of good parents, with good food, is almost a certain pledge of a superior offspring. The same natural process will, no doubt, be successful in the breeding of human beings, in so far as the mere animal part of humanity is concerned. That is to say, strength, and health, and corporeal beauty in parents, are most likely to be attended by the same qualities in their immediate offspring.

But a horse that is badly kept will speedily degenerate, one generation will destroy all its virtues, and reduce it to the level of the vulgar. It may still exhibit some of its original properties, but they must be dressed in the garb which is vulgarly called shabby-genteel, and is more the object of ridicule than of admiration.

Though good feeding is indispensable to the breeding of horses and cattle, it is not alone sufficient to secure an animal of the first character. There is an inherent property communicated by descent, of which we do not know the elementary cause; it is a species of mind or disposition, and is accompanied by a corresponding peculiarity of shape, and bodily vigour, all which together form a combination of excellences which are required to constitute a high-bred, or high-blood horse.

There is, therefore, an aristocracy of horses. A decayed gentleman horse is easily distinguished, a real gentleman horse is discoverable by the eye alone, and his value determinable by the inspection of his person only. We have no other standard for horses but their personal appearance.

The same may be said of every other animal.

We have, therefore, authority to conclude that Nature has created an aristocracy in every department of creation—even plants are subject to the same law; and the various estimations in which flowers and herbs of different species, as well as different individualities, are held, attest the same law in the vegetable as in the animal creation. This law prevails amongst men also.

There is an aristocracy amongst men. Superior men and women produce a superior offspring. If the same skill were displayed in the rearing of human beings, as in the rearing of inferior animals, the race of man might be wonderfully improved. Strength might be cultivated in one line of descent, as in dray horses; elegance in another line of descent, as in blood horses, and every variety of disposition and mental energy might be produced to its utmost possible development, whilst vices might be eradicated with the same facility with which virtues are cultivated.

Were wealth and power attainable only by superior minds and persons, our aristocracy would really be what they seem and pretend. Some of them really are superior men, naturally. Many have raised themselves by talent to their high eminence, and hereditary accomplishments have, in some instances, been fortunately preserved by judicious marriages. But these fortunate instances are more than counter-balanced ten thousand times by cases in humble or menial life, where the real native talent is superior to that of the class which rules over it. Here art is at variance with Nature. The breeder of cattle would not suffer this; he would raise and lower the condition of the animal in exact proportion to the personal virtues of the individual.

Let us suppose a real blood horse raising itself to a comfortable place in one of the king's stables, and taking to wife a brewer's mare of powerful make, but rather clumsy exterior, and awkward gait. This worthy couple, in time, produces a family of horses. The sire—being a genuine blood—is, of course, desirous to breed blood horses, but the fact of his doing so not being certain, he obtains a patent from the king, his master, to call his children blood horses, whether they really be so or not. These patent blood horses, in their turn, take to wives mares of various species, and enjoy their father's privilege of palming their offspring on the world as genuine blood, and thus the country is supplied with blood horses by act of Parliament, or a king's patent. The true blood animals are lost in the superior interest of the patent blood, and the king's letter becomes a standard, for the horse-dealer, and the horse-buyer, which attests the virtues of the original blood sire only, and the lineal succession of the rest, without even alluding to the personal virtues of the dams. In process of time, brewer's nags would be sold for genuine blood, and the genuine blood, for want of a patent, would be dragging the brewer's dray, or, perhaps, in a still lower plight—some hawker's cart, with crockery and hardware, from village to village, and feeding on the rank grass that grows by the way-side. Such a condition of science would be exactly analogous to that which at present prevails in respect to the breeding of gentlemen.

But it may be replied, that the condition of life, the education, the habits, the society of the higher classes, are calculated, independent of the original stamen, to make gentlemen of them. If this objection be insisted on, then it follows that the doctrine which we also insist upon, in part, and which Mr. Owen has made the fundamental principle of his social system, must be correct—that man is the creature of external circumstances. The same condition, the same education, the same society,

would make gentlemen of all men, if they make gentlemen of those who at present enjoy them.

That this really is the belief of the rich themselves, requires little proof, and they do not seem disposed to deny it. Education, society, fortune, make the gentleman of the world. Was your father a gentleman?—have you been in the habit of associating with gentlemen?—have you an estate? Then you *are* a gentleman. You have only to mention these three facts, and then you have established your claims.

Is there any truth in this assertion, that condition of life makes the gentleman? Most assuredly there is; and the principle of valuing is exactly the same as it is with the inferior creation. A man is valued by his properties, and so is a horse. But the properties of a man extend beyond himself—not so with the horse. The horse possesses nothing beyond his skin; the man possesses provinces and kingdoms. A horse is conscious of his properties, and assumes airs accordingly—it is so with a man. The man of large properties is more to be depended on than the man of small; his word is more valuable; he will not descend to such low and deceitful tricks as the poor man, merely to gain a few shillings or pence; he will willingly squander thousands to preserve his reputation. There are many exceptions on both sides, but such is the general character of the two extremes. We have more confidence in entrusting our property with a rich man. We have more confidence in his word of honour. His character is valuable to himself, as a mere property; it is a key to society of a high order; he dars not do any thing that would do it disparagement in the eyes of those with whom he is associated. Whatever is esteemed an indispensable virtue by that class, he must scrupulously adhere to, or be consigned to degradation. Many artificial virtues are thus formed, and the possession of property becomes a security for their cultivation.

Moreover, the circle of aristocratical acquaintance is very large and compact. The nobility, and higher gentry, are all known to each other—if not personally, by name and lineage. They have the privilege of calling upon each other without formal introduction. The card is sufficient. If the name be not previously dishonoured, the most hospitable reception is immediately given, though the person be an entire stranger. The estate is the guarantee. The person is the representative of land and wealth—he is accustomed to command—he has servants who obey, and he has money to spend—he must be familiar with the etiquette of high life. This is enough. What introduction is necessary? Why should Lord B. take a letter of introduction to Lord C., when B. is possessed of twenty thousand per annum, and C. knows it, though he never saw the possessor? This is a beautiful peculiarity of aristocratical life. Small as aristocracy is, compared with the people, the circle of acquaintanceship is the largest; the moral influence, therefore, is greater, independent of the conspicuous position which the individuals hold in respect to the public. But when we consider that a member of the aristocracy has not only a larger circle of acquaintances than an ordinary man, but he is also exposed, by the height of his station in society, to the gaze of the public, and his conduct scrupulously investigated by numerous enemies, who will always rejoice to find an opportunity of injuring his reputation, we are compelled to admit that such men, with only one half the *native* prudence of the ordinary plebeian, must have an *artificial* supply, as far superior as the fortune and rank are more elevated. In other words, there is a greater power of moral influence operating continually upon the mind of the aristocrat; and if he be not far superior in moral behaviour to the poor man, it is because he is inferior in real native moral, and conscientious stamen.

It is this moral influence that makes the man; and one grand political problem to be solved, is this, how to increase the amount of moral influence upon each individual. The great mass of mankind have very little of it, and some have none at all. There are many desolate, lawless individuals, in London, who have even less than none—who have a *minus* moral influence, acting in the opposite direction, and stimulating the pride and ambition of the individual to the commission of crime. How is this evil to be avoided? There is only one method—association. Association provides the moral influence—nothing

else can. The aristocratical circle, of which we have just spoken, is a sort of association, and the influence it exercises over the minds of individual members, arises from the circumstances of the social union. Were all society compactly arranged upon a similar principle—did each man belong to his series, his group, his association, society, or community—and were individual characters minutely scrutinized by their own series or group—were society so arranged, that no individual could live in it without belonging to a group, and following a profession recognized by that group—were his interest in the pursuit of that profession dependent upon his individual behaviour, as a member of the group to which he belonged—and were it impossible for him to pass from group to group without the passport of each, thus carrying his name and character along with him wherever he went—we are firmly persuaded that the morality of the country would rest upon a basis which would strengthen with time, and be co-lasting with the species.

This is our method of breeding gentlemen; and, after all, it is only the common way. It is only by giving men a character, and playing upon that character by a certain amount of moral influence, accompanied by a personal interest in the good estimation of their fellows.

Wherever there is association, this moral influence prevails. There are many different ways of associating, but men always should associate according to their trades and professions, the act of association being binding upon every individual, and the superiors chosen by the suffrage of the members. This would form a natural aristocracy. The leaders of the different associations would be the best men in the country, and might form the supreme court, to which all were amenable. There could not be a better, a simpler method, also, of electing the national legislators. At present, the electors are divided with the land, and choose, most commonly, some individual connected with the land which he represents. Almost all are land representatives. Soil is the country, in the estimation of our present legislators, and mind, genius, science, art, are not deemed worthy of a representation in parliament. Now these latter are, in our opinion, alone worthy of being represented, and if men were classified according to trades and professions, each class would choose its proper representative, and the legislature would be a type of the whole mind and talent of the country.

But the principal effect which we anticipate from such a classification, is the individual moral effect, the uniformity, the propriety, the justice, which would thereby be introduced into the transactions of business. Each association would form a benefit society, and court of honour, whose decisions it would be dangerous for any individual to gainsay, or defy; and any apparent loss of liberty to the individual, would be amply compensated by a greater security against fraud, and universal public confidence.

We have no idea of any thing like a trades' union with legislative authority. We consider nothing more than moral influence admissible with fractional departments of society. All political authority should be universal, and representative of every interest in the country. Neither do we think of a system like that of our old corporations, which require a premium for admission, and are controlled by a self-elected junta. We mean merely a sober enlistment of individuals under their respective categories, with such a moral marshalling of troops, or groups, or series, as that each individual in the country shall be registered, and his conduct and mode of subsistence understood by a class, whose interest it will be to preserve him in the paths of moral rectitude. This, we believe, is an idea somewhat resembling that contemplated by Lord Brougham, but which he never has had the courage publicly to insist upon, with his forcible eloquence. But even were it accomplished, it would still be defective as a moral regenerator, until land was declared the property of the public,* and personal property limited to moveables only.

* But how is this land to be obtained? How was land obtained at first—how is it obtained now—how was New South Wales or America obtained? By conquest. There is no other way of obtaining land. It is the legitimate way.

CHARLES FOURIER'S THEORY OF SOCIETY.

By Abel Transon, late Pupil of the Polytechnic School, and Engineer of Mines.

(Concluded from page 167.)

UNITARY OR PIVOTAL EQUILIBRIUM.

M. FOURIER gives this name to *passional agreement* in the distribution of benefits. This distribution is of the first importance. It is upon its success, that the maintenance of association depends, for association never can be upheld if the associates fall out upon the distribution of benefits.

Hitherto, says M. Fourier, men have been able only to give retribution according to the amount of capital. This is very easy, and requires only a knowledge of the most simple arithmetic. But to find a principle of division applicable to talent and labour, and one which, by its very nature, will satisfy the interested, as the *rule of three* satisfies the man of business—this appears, at first sight, beyond the power of man.

In the associations which have been attempted, or proposed up to this period, there are only two ways of remunerating labour and talent; either the equal participation of benefits, according to the principle of the community of goods, or the dispensation of those benefits by the superiors and chiefs of society considered as the most capable.

In respect to equal participation, or community, every one agrees that nothing is more incompatible with justice and true liberty than such a species of equality. This first process, therefore, merely avoids the difficulty of the problem, and does not solve it. As to dispensation by superiors, it is the principle of Catholic authority put in action. The St. Simonians, wishing that every one should receive according to his works, could only for want of genius borrow from the past this second solution; and as it was necessary, at every hazard, to come out of the brutal law of wages, which the master imposes on the workman, and the workman obtains from the master, those only who proposed something better could have, upon this point, as upon many others, condemned the St. Simonians.

In the problem of distribution, as in all other questions, M. Fourier is absolutely at variance with the common methods, but here, as always, he is faithful to his social compass—*passional attraction*; faithful to his system, association by groups, and series of groups.

"In respect to principles, he says, my theory is ONE, and invariable in all cases. Whatever problem presents itself upon this agreement of the passions, I always give the SAME SOLUTION; to form series of free groups; to develop them according to the three rules of compact seals, minute division of labour, and short hours, in order to give scope to three passions, CABALISM, COMPOSITION, and ALTERNATISM, which ought to direct every *passional series*."—(New World, p. 278.)

And, in effect, this simple arrangement suffices to prevent every kind of conflict in reference to interest. But, before illustrating the principal rules of equilibrium, in respect to remuneration, it is necessary to say a few words on the nature of administrative authority in the phalanstere, this subject having a direct relationship with that which now occupies our attention.

There is in association a great number of lucrative and honourable employments. This is the only means of satisfying ambition; but there is not, properly speaking, authority in the sense in which that word has hitherto been understood, that is to say, that no individual, nor body of individuals, has the right to impose its will upon others. Here obedience ought to be free and impassioned; it is the absolute reign of LIBERTY.*

* I think it useful to quote the following passage, which shows clearly the manner in which M. Fourier looks at the important question of power and liberty:—"Here you ought to remark a difference in the manner in which we treat the question of hierarchy, and that in which the Saint Simonians have treated it. I acknowledge having made great progress in changing the terms of the problem. I no more think of conciliating authority and liberty. Conciliation is nothing else than the confiscation of the liberty of the governed, for the benefit of the liberty of the governing conciliator. Now, for one who thus

In the phalanstere, in the province or empire, the functions of administration will all be elective; but the system of elections will have lost all the absurdities with which they justly reproach it at present; for, in the first place, the electoral title will always depend on the capacity of the elector, being always connected with his employment; in other words, every one will be called upon to nominate the chief of the groups to which he belongs, the chiefs of his series, of his phalanstere, thus rising successively in the political order; but no one will have a deliberative voice in a group, series, or phalanstere, &c., in which he has not employment. Moreover, the electoral right will be proportioned to the capacity, because the number of each individual's votes will depend on the number of groups and series of which he is a member: the elector, therefore, will always be competent in his choice, and the elective power, if I may be allowed to use this expression, will be found to graduate exactly according to the real merit of individuals.

The authorities thus constituted by election exercise only a power of opinion. In the social domestic establishment, for example, "The supreme court has no statutes to make nor to maintain, all being regulated by attraction, and by the public spirit (*esprit de corps*) of tribes, choirs, and series. It pronounces judgment on important affairs, such as harvest, vintage, buildings, &c. Its decisions are followed *passionately* as the compass of industry, but they are not binding; a group should be free to delay its harvest in opposition to the judgment of the *Areopagus*."—(New World, p. 734.)

However fantastical this result may appear, let us attentively consider, before rejecting it, that there is no medium between such a mode of the exercise of power, and that which supports itself upon constraint, and thus proves destructive to liberty. Could there be any danger of a series, by caprice or obstinacy, compromising the interests of the phalanx? This is precisely that which is impossible! But the members of one series being allied to at least thirty other series, will never be tempted to sacrifice the general to a corporate interest.† Such is one, amongst a thousand, of the advantages of labour in short periods, an idea truly beautiful, truly fruitful, which will be sufficient to change the condition of mankind, and which, once admitted, brings in its train, and renders easy of accomplishment, the brilliant promises of the social theory.

Here, then, is that which characterises the social system of M. Fourier, and secures the true individual independence of all the associates. "The *Areopagus* of the Phalanx has no influence over the principal operation; namely, the distribution of dividends in triple lots, proportioned to capital, labour, and talent. It is attraction only which is the arbiter of justice in this matter."—(New World, p. 134.)

Now, what are the tendencies of attraction in this matter? Here, as in every other effect of movement, the development of attraction is twofold.‡ It is direct and inverse. It tends to individual well-being, and to collective well-being. It produces cupidity and generosity. It is the employment of these two motives mutually counterbalancing each other, which secures equilibrium in distribution.

M. Fourier shows, at first, that the charm of social life will produce intentional alliances (*accords*) very powerful. "In

understands things, it is necessary either to return to the ways and means of ancient authority, or continue in the system of the age, and push forward our desires and meditations upon liberty. Authority, or liberty, these are the two terms between which we have to choose—at present the choice falls upon liberty. Over the whole surface of the earth, the people demand liberty. In no country have they obtained it, nor will they obtain it, with the known means," &c.—(Exposition of the Social System of M. Fourier, by Jules Lechevalier, vol. I. p. 201.) This work may be obtained at Paulin's, Place de la Bourse, or at the office of the Phalanstere.

† It is also the art of uniting by interest each phalanx, with a great number of phalanxes, near or remote, which will secure the respect of each to the decisions of the central administration of the province.

‡ The resemblance between the doctrine of Fourier and that of the Shepherd is here very obvious.

combining, with all the enjoyments of material life, the absence of cares from which fathers and mothers will be delivered—the contentment of fathers, disengaged from the expenses of domestic economy—the contentment of women, delivered from a troublesome housewifery, without money—the contentment of children, abandoned to attraction, excited to the refinements of pleasure, even in epicurism—in fine, the contentment of riches, as well in respect to the increase of fortune, as the disappearance of all the risks and snares with which an opulent civilian (*civilisé*) is surrounded, it is easy to perceive that the experimental phalanx will have, from the first month, no other solicitude but that of maintaining so beautiful an order; and knowing that its maintenance solely depends on agreement in distribution, it will feel anxious for the means of effecting this distribution, of which there will be doubts during the first campaign, because they will not yet have witnessed it, the distribution taking place in January or February, after the close of the inventory. You will then see series, groups, individuals, in concert upon this agreement, eagerly adopting resolutions the most generous, and engaging to make sacrifices which are not necessary. Every one will strive, with intentional devotion, and disinterested resolution. Each one, at the idea of relapsing into civilization, will be horrified, as at the thought of falling into the furnace of hell, &c. From that time, the love of unity, interlational agreement upon the preservation of unity, will be raised to the very highest degree.”—(*New World*, p. 323.)

Moreover, the development of the affective passions, and the combinations which result from them, and of which I have given the principles, will produce a real generosity amongst the different classes of association. M. Fourier points out in detail, the regular employment of this sentiment, and its power of creating harmony in the distribution of benefits; and afterwards he addresses himself to point out how the desire of personal gain, the cupidity which produces effects so odious in the unsocial system, here coincides with the interests of justice and of truth. Let us enter a little into the study of this mechanism.

The dividend allotted to each series is not determined by the quantity of its products. This method would be completely false, in an order of things where labour is free, and attractive series are classed in the order of *necessary, useful, and agreeable*, and each of these classes is itself subdivided in different degrees. The lot which falls to each depends upon the rank which it occupies in this classification, and is taken upon the sum total of the wealth of the whole phalanx. It may, therefore, happen, that a series devoted to a labour very productive, such as the cultivation of fruits, may be less remunerative than the series which is charged with the care of young children, if it is considered that this last kind of labour has of itself less attraction, that it is more necessary to the maintenance of society, &c. This classification is very delicate, and might give occasion to many grave mistakes. In supposing it very regularly established, it happens that each individual directly, and for his own personal advantage, is interested in seeing that no series be defrauded of its rights.

Each individual, by the very nature of the social system, is engaged in a great number of series. Now, if there be a false estimation of the real merit of each series, he will be injured at first, in the dividends which he receives in the series in which he excels, and where he has a right to the largest shares. Moreover, he will be offended at seeing their labours and his own ill-rewarded. In fact, this injustice would be in favour of the series in which he is inferior, but here, finding himself remunerated with small dividends, he would not be compensated for the reductions he experienced in those in which he obtained larger shares. On the other hand, he would not undervalue those series in which he is an inferior, but in which his inclination has recently prompted him to enrol. He esteems and protects their industry. He supports them by *cabalistic* friendship and self love. As to the series in which he is a member of mean rank, obtaining mean (*moyens*, middling) shares, it subserves his own interest that they obtain that which is their due, without encroaching upon the other two cases (*categories*) in which he is superior or inferior. Under all these relationships, he is then compelled to desire exact jus-

tice in distribution; it is the only means of satisfying at once his self-love and his affections.—(*New World*, p. 368.)

If, in spite of these considerations, it should still be feared that each individual be tempted to favour the series in which he has a right to considerable shares, it will suffice, to make every difficulty disappear upon this point, to remark, that these series will be necessarily remunerated upon the three principles of the *necessary*, the *useful*, and the *agreeable*. “Now if he should succeed in causing favour to prevail, he could not extend it to all, but only to one of the three; wherefore, obtaining an advantage upon the series of one of the three orders, he would lose as much upon the others, and after all, have no gain upon the whole. He would reap nothing but dishonour by this injustice, general distrust, and loss of all suffrages for various lucrative employments, which are numerous in harmony, &c.” Thus, cries M. Fourier, in the social state, injustice turns always to the detriment of its author. The *regime* of impassioned series is a mechanism which seeks justice, &c.—(*Ibid.*)

I regret not being able to do more than glance over objects so very important, to which the author has devoted long chapters. Let us keep only to the fundamental property of the mechanism of remuneration amongst the series, a property which may be expressed by the following formula:—“to absorb individual cupidity in the collective interests of each series and the entire phalanx, and to absorb the collective claims of each series (by the individual interests of each member) in a crowd of other series.”

And think you that M. Fourier stops here! But you see very well that the problem is not yet solved. It is necessary, now, that the dividend allotted to each series be distributed amongst its groups, and from groups amongst individuals. For the distribution amongst groups, it will suffice to establish amongst the groups, which form each series, a classification analogous to that of the series which compose the phalanx; but for that which regards the partition amongst individuals, we must employ another principle not less important than the division of series into three orders. It is, that individual distribution should be based upon the three industrial faculties—LABOUR, TALENT, and CAPITAL.

But here, before saying how talent ought to be appreciated, how labour should be taken account of, according to fatigue, the number and duration of its exercises, in what relative proportion the three faculties should be remunerated, &c., how many questions arise, which are of capital importance, and which it is necessary to examine in all their phases!

And to mention only one of the most conspicuous, would it not be necessary to show that the remuneration of capital, which, in the present condition of society, encourages the indolence of the lender, and returns, almost always in an odious usury, to the detriment of the labourer, that this remuneration becomes, in the social order, one of the most powerful stimulants of labour, one of the surest pledges of harmony? But I pause, for I feel that the immensity of the subject overflows the limits which I ought to impose upon myself in a simple analysis.

If I have succeeded only in convincing the reader that the theory of M. Fourier forms a *whole*, a *complete whole*, from which nothing can be detached—above all, if I have inspired him with a desire to know for himself an order of ideas entirely new, and which appears to respond to the most urgent wants of human nature, I shall have gained the end which I proposed.

But if, entirely confining my task to the exposition of the constitution of the domestic establishment, that is to say, of the most simple element of society, I can only point out the general methods followed by M. Fourier, what must be thought of that work which embraces the highest questions which the human mind has ever investigated, which treats of the past and future destiny of the individual, which subjects to precise laws the successive developments of humanity, which shows, in supporting itself upon close reasonings, the wonderful modifications, which, by systematic culture, man will be able to impress upon the conditions of his planet, which touches, in fine, upon the universal problem of the appearance and disappearance of life at the surface of the globe, sketching with bold outline a theory of past and future creations?

Before this immense work, I am constrained to withhold my

own personal opinion; for whilst it treats of the interests of entire humanity, what is the worth of an obscure and individual testimony? But seeing that so many new and fertile ideas have been summarily presented to the public, within these last twenty years, and expounded systematically, and in detail, with the last ten years; and since, during this long period, the author has remained neglected by his contemporaries, I think I cannot better conclude than by repeating to the reader these remarkable words that M. Fourier wrote in 1808: "When I bring forth the discovery which delivers the human race from civilized, barbarous and savage, chaos, assures it of a greater amount of happiness than it even dared to expect, and opens before it the whole domain of nature, from which it imagined itself for ever excluded, the multitude will not fail to accuse me of quackery (*charlatanerie*), and wise men will think they treat me with moderation in regarding me only as a visionary. Christopher Columbus was ridiculed, reviled, excommunicated for seven years, for having announced a new continental world. Ought I not to expect the same disgrace in announcing a new social world? One cannot clash with all opinions without being a sufferer; and philosophy, which reigns over the 19th century, will raise more prejudices against me, than superstition against Columbus in the 14th century."—(*Theory of the Four Movements*, *Preh. Disc.* pp. 35 and 38.)

* M. Just Muiron, of Besançon, was for a long time the only pupil of M. Fourier. He published in 1824, a *Treatise on the Industrial Systems*, in which he compares the unsocial (*morellec*—piecemeal), to the social system. At present (1832), he is publishing a new work, "*Social Transactions, Religious and Scientific, of Virtumnius*," in which he explains the opposition of character and forms, in which religion, science, and law are invested, according as humanity organises itself in conformity with, or in opposition to, its providential destinies. These works are to be obtained from Bossange, senior, *Rue de Richelieu*, No. 30; or Paulin, *Place de la Bourse*; or at the bureau of the Phalanstère *rue Joquelet*, No. 5, behind the Bourse.

THE JUDGES OF ISRAEL

[The following extract from a lecture by Mr. Smith, delivered in 1833, is strong and perhaps offensive to many, but the striking truths it conveys are too important to be lost. We give it verbatim. It was never before published.]—

Some people imagine that the Bible was invented by priests, to establish and secure a dominion over the minds of the vulgar, but it seems more likely to have been invented by soldiers, if it was the invention of any set of men. There is very little encouragement given in the Bible to priests, they are generally treated with great severity, and, with one or two exceptions, denounced as hypocrites. The prophets of Israel, as well as the apostles, were all in the minority; the public prejudice was against them, they had to fight against prevailing opinion, and it was not till they were dead, and their bones were dry, that their names were honoured, and their writings collected for preservation. The priesthood afterwards took hold of these writings, and abused them; it has not the original genius for invention: but it has the genius of corruption without a rival, unless that rival be the legislature, which grows and preys upon our outward substance, whilst superstition preys upon our vitals. A man of blood, a successful warrior, a man possessed of large bones and strong muscles, seems to rank, in the estimation of our inspired historians, highest in the list of righteous men, models for our imitation. To kill a lion, without the aid of any marshal weapon, to attack a bear with no other weapon than what the bear himself was possessed of, to bring down a giant to the ground by a sling and a smooth pebble from the brook, to put to flight the Philistines with an ox goad, or treacherously lodge a dagger in the belly of a heathen who had gained the victory over the armies of the living God—these were feats of the very highest order, recommendations of character that would advance a man to the highest offices of distinction at court, and we find them extolled by the apostles and prophets, and psalm-singers of Judah and Israel, as if all virtue, all worth

consisted in knocking out a man's brains, or tearing a living creature to pieces. "Time would fail me," says St. Paul, "to tell of Gideon and Barak, and Samson and Jephthah, of David, also, and Samuel, and of the prophets, who, through faith, subdued kingdoms, wrought righteousness, obtained promises, stopped the mouths of lions, quenched the violence of fire, out of weakness were made strong, waxed valiant in fight, turned to flight the armies of the aliens." This is virtue! Not a word does St. Paul say of the arts of peace: of teaching the people to read and to think; to cultivate kind feeling and sociality one with another; to emulate each other in inventing and discovering new modes of applying the infinite resources of nature to our own advantage; no! bullying and swearing, and fighting, murdering, and multiplying the evils of society, are the boasted accomplishments of the heroes of Israel. And these are the models whom we are taught to admire, and whose virtues we are required to emulate! Our parsons take these worthies as examples to encourage their disciples to the practice of virtue; they write sermons and treatises upon Scripture characters, exalt the heroic virtues of a murderer, a traitor, a liar, a fox-hunter, and an incendiary; yet think it very impious for the people to put these lessons of theirs into practice, and, like Samson, to burn the standing corn of the rich farmers, who monopolize the fruits of the earth to themselves. Samson was a righteous man, and one of St. Paul's heroes, one of the saints who have now gone to glory, and whose works have followed them to bear witness in their favour; but the unfortunate Samsons of modern times are tried before the judiciary court as knaves, and sentenced to expiate their offence by death or transportation. With the same spirit as their grand prototype in the Bible, and with much deeper injuries upon which to found a quarrel, they, the imitators, are held up to scorn, and public indignation, by the very men who write sermons and compose eulogies upon the original. When Samson lost his wager, and forfeited the thirty changes of raiment to the Philistines, who attended his wedding, giving him the solution of his riddle, he found these thirty changes of raiment by going out and slaying thirty men, and stripping them of their clothing; he had no other cause of quarrel with these thirty men, than that they had got clothes on their backs; and we are told that the spirit of the Lord fell upon him to strengthen and encourage him to this deed of highway robbery. The Spirit was always ready to serve him in any extremity, provided he did not crop his hair—this was the only sin that Samson could commit—the spirit of the Lord was his humble servant on all occasions till then, whether in committing murder or highway robbery, or clandestinely destroying the nutritious produce of the earth, in seeking a wife, or only looking out for a mistress; the spirit was always at hand, like the genius of Aladdin, to answer all his requests, provided he rubbed the lamp or the ring upon his finger. When Aladdin lost his lamp, and the old magician got possession of the treasure, the genius was the young man's servant no more; it was evident that the genius was no respecter of persons, but a notorious respecter of lamps, and would serve any rogue at a pinch, provided he did him the gratification of rubbing up his favourite old burner. As long as Samson kept a razor or a pair of scizzors from his locks, he was a happy man; but the spirit of God departed with the hair and felt no pity for a shorn head; it came back as the hair grew, but it was too late; the hero had lost his eye-sight, and though the spirit restored his strength of body, he refused to restore his vision. It is said of Samson that he judged Israel twenty years. He must have been one of the circuit judges, for he seems to have had no settled place of abode, and is more like one who ought to have stood at the bar, than sat upon the bench.

Ehud was another of these Jewish worthies: he made him a dagger with two edges, and went slyly to Eglon, king of Moab, who at that time ruled over Israel, and declared that he had a message from the Lord to him. The Lord was then in much higher repute than he is now, and a message from the Lord was not treated with that contempt which the priests and legislators now show to prophets and prophetesses who have been the making of them. Ehud was admitted to the presence-chamber of the monarch to deliver this message from heaven; the servants

were all sent forth, that no profane ear might hear the purport of the sacred commission. Ehud drew the dagger from under his raiment, and plunged it into the bowels of the Moabite. This was the message of God, and thus was the faith of the king of Moab rewarded. I do not say that this was a bad action; tyrants should be answered with the same arguments which they use towards their subjects, or rather, their victims. They use treachery and fraud to ensnare and destroy, and treachery and assassination, are but an expiation in kind, of a thousand crimes of a similar nature. He that killeth with the sword, let him die by the sword, and he that leadeeth into captivity, let him go into captivity himself. Ehud was a hero, certainly, and a deliverer of his country; but the misfortune is, we hear no more of him; this seems to have been the only example of extraordinary virtue which the historian has thought worthy of being transmitted to posterity, and it is a compound of treachery and murder, if not hypocrisy, for our priests will tell you that the message from the Lord was a mere pretence on the part of Ehud; this, however, they say without authority, in order to screen God from the guilt of murder, craft, and treachery, which have been practised in his name, without intermission, since man was created. Whatever other virtues Ehud possessed, they are all swallowed up in this glaring, dazzling virtue of daring assassination. In vain will we look for any thing rational or scientific, amiable, and philanthropic, in any of these heroes; it is all blood and wounds, and the praise that is due to virtue is conferred upon bullying and murder. Another of the judges of Israel was Shamgar, and the only virtuous action that is recorded of him is, that he slew six hundred men of the Philistines with an ox goad. He, also, is a worthy model for Christians to follow; with whom, perhaps, it would be accounted impious to compare Achilles, or Hector, or Milo the Crotonian, who carried a full-grown bull upon his back for a quarter of a mile, and then knocked him down with one blow of his fist. It is said that he ate him up immediately after, but the infidels won't believe this. After Shamgar came Deborah, a prophetess, and her right-hand man, Barak, and that blessed above all women, Jael, the wife of Heber, the Kenite, who invited Sisera into her tent, under pretence of hospitality, saying, "Turn in, my lord, turn in to me, *fear not*." She covered him with her own mantle, and gave him milk to drink; and when he was asleep, she struck a nail into his temple, and treacherously murdered him; for which deed of almost unrivalled baseness and treachery, the spirit of the Lord inspired a song of praise, in honour of the heroine. "Blessed above women," says this inspired song of the Lord's composition, "blessed above women shall Jael, the wife of Heber, the Kenite, be; blessed shall she be above women in the tent. He asked water, and she gave him milk; she brought forth butter in a lordly dish; at her feet he bowed, he fell, he lay down—at her feet he fell down dead. She put her left hand to the nail, and her right hand to the hammer, and with the hammer she smote Sisera; she smote off his head, when she had pierced and smitten him through the temples. So let all thine enemies perish, O Lord." If the clergy refuse to acknowledge that Ehud's message from God was real, and not pretended, surely they will not deny that this psalm is of divine authority, and that the treachery of Jael has received the Lord's sanction. The next hero of Israel is Gideon, a man of war also, and one, at least, among the list of barbarians, whom the sacred historian has thought proper to represent as a teacher, for we are told that he took thorns of the wilderness, and briers, and with them he taught the men of Succoth. Birch rods are considered severe enough in modern times, but Gideon wanted the patience which is usually ascribed to the saints, though with very little reason, for David, the king of saints, and the purest of all teachers and songsters, improved upon Gideon's example of severity, by using saws and harrows of iron, instead of thorns and briers, with which he also taught the inhabitants of Rabbah. There are several of the judges mentioned by name, merely, without any circumstance attached, descriptive of their character. Of one it is said, that he had thirty sons, who rode upon thirty asses' colts; of another, that he merely judged Israel twenty-three years, and then died, and was buried. It was unfortunate for these, that they had not

committed some horrid deed of murder, incest, or cruelty, for then their names might have descended to posterity with some degree of historical halo around them.

Jephthah was a bastard, who was banished his father's house by his brethren, on account of his strange descent, although in those days of concubinage nothing certainly could have been more common than for a man to come into the world under such circumstances. After being thrust out of his father's house, he became the leader of a band of vain fellows, an example which David himself afterwards followed. These vain fellows were, no doubt, banditti; for it is not to be supposed that a set of roaming adventurers could, in such a state of society, obtain a living otherwise than by plundering the property of others, and levying by force a tribute upon the produce of other men's labours. This man became one of the judges whom God raised up by times to deliver his people from the hands of their enemies. And the spirit of the Lord came upon Jephthah as he came upon Samson, and he marched against the children of Ammon to battle, and he vowed a vow unto the Lord, and said, "If thou wilt without fail deliver the children of Ammon into my hands, then it shall be, that whatsoever cometh forth of the doors of my house to meet me, when I return in peace from the children of Ammon shall surely be the Lord's, and I will offer it up as a burnt offering." The consequence was, that on returning home, his daughter, his only child, came forth to meet him with timbrels and with dances, and thus she became devoted, and could not be redeemed according to the law of Moses, which says, "No devoted thing that a man shall devote unto the Lord of all that he hath, both man and beast, and of the field of his possession, shall be sold or redeemed. Every devoted thing is most holy unto the Lord. None devoted which shall be devoted of men shall be redeemed, but shall surely be put to death." There has been much controversy amongst divines and commentators respecting this barbarous vow of Jephthah's; but it is evident that the controversy has arisen not from any difficulty connected with the manner in which the narrative itself is told, but because it brands the name of the God of Israel with the same infamy that attaches itself to the gods of the Gentiles, to whom, according to Plutarch and Pliny, even in Rome, as well as in neighbouring cities and countries, human victims were offered at times by way of effecting an extraordinary expiation for national crimes, or for averting national calamities. To wipe off this slander from the God of Israel, the Jews and the Christians, not understanding the nature of the God they worship, have endeavoured to give the lie to the inspired historian by saying, that as human sacrifices were not permitted to be offered upon the altar by Moses, it was allowable for Jephthah to redeem his daughter by a gift to the Lord. The very face and spirit of the narrative, however, belies this interpretation, for as soon as the father saw his daughter come forth, "he rent his clothes," and said, "alas, thou hast brought me very low, and thou art one of those that trouble me, for I have opened my mouth unto the Lord, and I cannot go back." And it is added, "*he did with her according to his vow.*"

This custom of sacrificing men to the deity was so prevalent in ancient times that the sacrifice of Jephthah's daughter is but an ordinary transaction, amid a thousand others of a similar nature. The neighbouring nations were in the habit of offering the same sort of oblations to their gods, and the Jews were perpetually apostatising from their own religion to those heathen rites, and even going so far as to offer up their children as burnt offerings to Moloch. It is not to be supposed that they could be guilty of such barbarous deeds, in honour of a foreign god, could have such refined conceptions of the God of Israel as to think him incapable of being gratified with the same species of sacrifice. Perhaps they thought they had reason to regard the God of Israel as merely one of a family with Moloch, and Baal, and Chemosh, and all the gods of the neighbouring nations, one whose daily food was the blood of bulls and goats, &c., but who had no objections to human blood at times, as an extraordinary atonement. In the days of King David there was a severe famine for three years, and David inquired of the Lord the cause of this national calamity. The answer of the Lord was, that the famine was for Saul and his bloody house,

because he slew the Gibeonites. The Lord, of course, must be appeased, and for this purpose David *hanged up seven of Saul's sons before the Lord in Gibeah*, and David took the bones of them that were hanged, and the bones of Saul and Jonathan, and buried them, "and, AFTER THAT, God was intreated for the land."

Is not this a proof that the God of Israel delighted in human sacrifice, or, at least, accepted it occasionally as an expiation for national sins? Saul's kingdom was rent from him because he spared Agag, the king of Amalek, who was a devoted person; and Samuel, the prophet, took a sword and hewed Agag in pieces before the Lord, saying, "obedience is better than sacrifice, and to hearken than the fat of rams." That is, when God requires a human sacrifice at your hands, he won't be satisfied or put off with a ram. David hanged these seven sons of Saul, in despite of the oath which he swore by the Lord that he would not cut off Saul's seed after him, nor destroy his name out of his father's house; but he spared Mephibosheth, the son of Jonathan, on account of the oath which he swore unto Jonathan. It is common with princes to keep oaths, or to break them, according as they find it expedient, or agreeable to their own sovereign will or pleasure. When they keep them, they boast loudly of their integrity, their honour, and religious fidelity; when they break them, they excuse themselves upon the plea of necessity, and repeat the old proverb of tyrants and priests, "keep no faith with enemies and heretics." When the king of Moab was sore pressed in battle by the kings of Judah and Israel we are told (2 Kings, iii, 27) that he took his eldest son, that should have reigned in his stead, and offered him up as a burnt offering upon the wall. This is a sacrifice perfectly analogous to that of Jephthah's daughter; and we have good reason to believe that Jephthah and his army of barbarians, who imbibed so much of the superstitions of neighbouring nations, would have considered a breach of the barbarous vow of their general as much more impious, and more likely to produce national calamities, than the performance of it. Saul vowed a vow of a similar nature, and Jonathan, his son, was taken in the snare, as Jephthah's daughter was. Saul said, "*thou shalt surely die, Jonathan.*" He had no scruples of conscience about putting his son to death; the scruples were all on the other side of keeping him alive; he considered it sacrilege to save him—*it was robbing God of a gift*; and Jonathan's blood must have been spilt to appease the God of Israel, had not the people interfered and saved his life, on account of the bravery he had shown in the battle, the success of which was owing entirely to the daring enterprise of him and his armour bearer.

Taking all these facts into consideration, it is evident that, although human sacrifices were not amongst the usual offerings to the God of Israel, nor such as could be offered upon the national consecrated altars of the priesthood, yet they were not only such as might be made the subject of a vow to the Lord, in which case they must be faithfully performed; but they were such, also, as were at times practised as extraordinary expiations for the removal of national calamities, as was the case with the offering of Saul's seven sons upon the gibbet at Gibeah, with which offering the Lord was so well pleased, that we are told he was entreated for the land, and gave the people deliverance. When we are told, therefore, by the historian that Jephthah did with his daughter according to his vow, we are not left to conjecture upon the subject. There is no interference on the part of the people mentioned, as was the case between Saul and Jonathan; there is no compromisal or redemption spoken of. Saul never proposed to liberate Jonathan by a gift to the Lord; it was either death or deliverance; but Jephthah's daughter got two months to bewail her virginity on the mountains, and after that she returned to her father, who did with her according to his vow, that is, he burnt her body, as a sacrifice of thanksgiving to the God of Abraham.

Divines and commentators attempt to evade this conclusion, in order to save the credit of the God of Israel; but there is no occasion. The garments of the God of Jacob are not to be soiled by such a drop of blood as issues from the veins of a single woman. They are not only stained, but dyed deep and rich with the blood of human nature. "Who is

this," says the prophet Isaiah, "that cometh from Edom with dyed garments from Bozrah, this, that is glorious in his apparel, travelling in the greatness of his might? I that speak in righteousness, mighty to save. Wherefore art thou red in thine apparel, and thy garments like one that treadeth the wine-press? I have trodden the wine-press alone, and of the people there was none with me; for I will tread them in mine anger, and trample them in my fury, and their blood shall be sprinkled upon my garments, and I will stain all my raiment." The manner of slaying the victim is a mere trifle to dispute upon—whether he be slain upon an altar, burnt in a fire, or cut to pieces in the field of battle. And as to the person offered, it can signify nothing to God, whether he be a Jew or a Gentile, a Unitarian or a Polytheist. He who delights to stain his garments with the blood of men, who boasts of their redness, and styles himself the Lord of Hosts, and the God of battles, and glories in the carnage he creates, can never have his reputation sullied or dishonoured by human sacrifices. If bulls, and calves, and goats, must die to please him, why may not human blood be equally savoury? The feelings of the brute creation are, probably, as acute as our own, their life is as valuable, their self-love and love of life are as strong. What is there in human sacrifices more revolting to God, than the sacrifices of sheep and oxen? Nothing, but what human selfishness has imagined, as an excuse for the assumption of superior sanctity to itself, and superior claims upon the bounty and loving kindness of the Deity. But we see very little of that special bounty. He provides for the sparrows better than he provides for man. None of the brute creation are reduced to despair; but man is often cast off by Providence, and forced by grief, and hopeless destitution, to cut the thread of his own existence, and take that quietus for himself which Nature refuses to bestow.

This system of sacrificing human victims is not peculiar to ancient times. The sacrifices of the Jewish economy were consummated or perfected by the offering of human blood. Jesus Christ was not slain upon the altar of God in the Jewish temple, any more than Jephthah's daughter was; it was contrary to the law of Moses to suffer such a victim to bleed there; but the deaths of Christ, his apostles and martyrs, are always designated by the name of sacrifices, notwithstanding, &c. &c.

N. B. This is only a one-sided view of the God of Israel.

THE TRANSCENDENTALIST'S DIALOGUES.

No. XVII.

ON TIME AND SPACE.
(Continued from p. 158.)

TRANSCENDENTALIST, looking at "Shepherd."

Trans.—Come, that's a good joke! I have headed my last dialogue "On Time and Space," and the deuce a bit about time or space either does it contain. Shall I send an erratum? No, no; it bears indirectly on the subject, so I'll even let it stand.

Enter IDEALIST.

Oh, here you are! We'll now have some talk, really and *bona fide*, about time and space. And, first, a little conversation on our dearly-beloved "motion." Now it strikes me, that motion is the only exponent of physical power.

Ideal.—Why, you have said, that a body can have power without actually being in motion. Thus the body at A,

A—————B

has the full power of being at B, while it remains stationary.

Trans.—I know that; but its power of being at B is not manifested till it actually has been there. Understand, I do not say that motion is power, but that it is the exponent of power. Were everything stationary, no physical power would be exhibited. Neither the block of marble, nor the complete statue, would manifest power; they might always have been what they were, for all we should know to the contrary, and whatever power they might have, would be a profound secret. The power of the marble to become a statue, is manifested by the transition. We will now return to time and space. It is very clear

that Zeno's argument against motion will apply equally against time. Assuming every hour to contain an infinite number of moments, each of which is a particle of time, of course it would be impossible to pass an hour, since it would be of infinite length. We shall solve the difficulty, by making a given unity in time an ultra-continuity (*vide* last Dialogue) or a quantity incapable of division. I can now tell you why I broke off the subject of time since Dialogue XIII. I there spoke of a power begetting time. While uttering this, Zeno's difficulty flashed upon me,* and I began to inquire, how can any given portion of time be begotten, since, to produce even a minute, an infinite number of moments must be gone through. Hence, I began to investigate Zeno's difficulty, and think it is solved by the idea of ultra-continuity.

Ideal.—At any rate we have settled enough to go on.

Trans.—Now, there are two classes of readers; in which can talk freely on metaphysical abstractions, another of which can only understand these, provided they are accompanied by physical illustrations. Now I shall talk to you in the abstract style, but I shall print the dialogue in a parallel column, containing the symbol, for the benefit of less metaphysical readers.

Let A be an activity, totally unimpeded, except at the point B.

Did the activity cease at the point B, that point would not impede it, the activity would stop itself, and no outward resistance would be manifest.

Therefore, the activity does not stop at the point B, that is, it passes it.

Ideal.—You remind me of an acute remark of Montaigne's, "One must kick at a door, to discover whether it be bolted." That is, you may stand as close to a door as you please, but you will never discover that it is bolted, till your activity is impeded by it, and by it alone.

Trans.—Therefore, as A passes B, and has no other impediment, it is an infinite activity.

But, as it is impeded at B, it is a finite activity.

Therefore, it is an activity both finite and infinite.

Ideal.—This is most singular! I remember, in your old dialogues with the Materialist, you said that the finite proved the infinite, that is, that a thing being bounded, proved there was something beyond the bounds. Now we have come to a most extraordinary result, namely, that the thing bounded is itself unbounded—Heavens! what an apparent (if not a real) contradiction!

Trans.—Query, can the contradiction be avoided?

Ideal.—It seems to me that it arises by the assumption of the stoppage at B. Could we avoid this assumption, we should also avoid the contradiction.

Trans.—I never intended to proceed, except on the hypothesis that A was impeded at B. However, as we find the hypothesis involves a contradiction (notwithstanding, I deem it a true hypothesis) let us see if we can do without it. Suppose A not to be impeded at any point. This position will give rise to two hypotheses. Either, 1st, A impedes itself (not "is impeded," which seems to imply a foreign impediment), or, 2ndly, A is not impeded at all.

Ideal.—Exactly.

Trans.—Now, let us examine the first hypothesis. What is meant by a self-impeded activity. "Impediment means 'obstacle,'" "to impede," means "to set an obstacle." If an

obstacle is set, no matter by what, that obstacle will be at the point B of the old hypothesis, which you so cavalierly rejected, and the consequent contradiction of "the bounded being unbounded will arise" If an obstacle is not set, the activity is unimpeded, and we are brought at once to the second hypothesis. What is an unimpeded activity a nothing? Activity is only manifested by overcoming obstacles. What is an activity manifested to nobody or nothing?

Ideal.—Can it not be manifested to itself?

Trans.—Well, let it look at itself, what does it see? How can mere unproductive activity be contemplated even by itself? Would you have a nothing in a state of self-admiration?

Ideal.—I believe we must go back to the A impeded at B, and endeavour to reconcile the contradictions as it may please providence.—

Trans.—I think so too! Of that hereafter.

TO READERS.

The contents of this dialogue are the result of reading Fichte, though what is his, and what my own, I cannot precisely say. The fact is, the only use of reading a philosophical work is to waken ideas in one's own mind, and no one by a mere receptivity will penetrate the writings of a deep philosopher. One must instruct one's self, and hence arises the difficulty of distinguishing between those ideas which a philosopher has given, and those that he has merely awakened. It is the power of constructing that is wanting to the ordinary class of readers; they take a difficult author, and throw him aside, because he does not clearly set forth his meaning. The fact is, he cannot clearly set forth his meaning. Philosophy is an act of the highest freedom, and hence, a profound investigator can only tell you the way he has gone; he cannot give you what he has attained. You must travel along his road from your own free activity before you can gain his point of view; and a man can no more become a metaphysician from mere reading, that he can become a great traveller by the perusal of a book of roads. Why should a person struggle against a difficulty he has now felt? The negative is the stimulus to action, when you discover that your most common axioms involves contradictions. This very discovery of contradictions is a free act; it may be called the destructive side of philosophy. The constructive begins to abolish their contradictions, to reconcile them, or perhaps even to show that a contradiction is not necessarily a falsehood. The philosopher can merely exhort you to proceed, he cannot pull you along, he is a finger post, not a conveyance. Hear what the venerable sage of Berlin says in a note to his *Grundlage*: "The *Wissenschaftslehre* must exhaust the whole man; it can only be apprehended by the totality of his whole faculty. It cannot be a philosophy of general application, so long as in so many men education destroys one power of the mind for the sake of the others, as the imagination for the sake of the understanding, the understanding for that of the imagination, or both for that of the memory; so long will it be confined to a narrow circle. This is a truth which is equally unpleasant to hear and to tell, but nevertheless it is the truth."—Fichte.

TO SHEPHERD.

I will consider "faith and knowledge;" but before I write, I should like to read a little book by Göschel on the subject.

+ I.e. doctrine of science," the name given by Fichte to his own system.

TO CORRESPONDENTS.

We have merely room to notice the receipt of J. G. We fear he is too sensitive and particular for this world. May we publish his letter? We have also received two letters from H. D.

LONDON: Printed and Published by B. D. COUSINS, 18, Duke-street, Lincoln's-inn-fields.

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 23, VOL. III.]

SATURDAY, DECEMBER 2, 1837.

[PRICE 1½d.]

TWO CHRISTIANITIES FOR TWO WORLDS.

To man, that was i' th' evening made,
Stars gave the first delight,
Admiring, in the gloomy shade,
Those little drops of light.

Then at Aurora, whose fair hand
Removed them from the skies,
He, gazing tow'ards the East, did stand;
She entertain'd his eyes.

But when the bright Sun did appear,
All these he did despise;
His wonder was determined there,
And could no higher rise.—*Waller.*

THERE are very few ideas to which we attach more importance than to that which is expressed by the five words which constitute the title of this article.

The gospel of Christ has a double history. In the first, it is a curse; in the second, a blessing to society. In the first it brings the sword; in the latter, peace to mankind.

The first is merely a false gospel, or a fore-runner; the second is the genuine gospel, or good news of the universal monarchy—the reign of God, or the *rex Dei*.

The Christian sects are all aware, that a forerunner, by the name of Antichrist, was to make his appearance, before the true reign of Christ was established; but self-love has always taught them to regard their neighbours as the beast, and themselves as the holy ones of Israel. It is difficult for a beast to see its own horns.

St. Paul describes the man of sin as already working in his day—only there was an obstacle to his full manifestation, "he who letteth (or hindreth) will let until he be taken out of the way." The political Roman empire prevented the Church from seating itself on the throne, and reigning over the kings of the earth. That obstacle was in time removed, and the man of sin appeared in his glory, "whose coming is after the working of Satan, with all power, and signs, and lying wonders, and with all deceivableness of unrighteousness in them that perish,"—"Forbidding to marry, and commanding to abstain from meats,"—"having a form of godliness, without the power," &c., are also characteristics of the apostasy. It is common for one church to brand another with these attributes of the man of Sin; but, for our own part, we regard the whole Christian Church as one grand apostasy, a many-headed monster, and every individual (ourselves included) as a member of the hydra. The only difference between us and others is, that we perceive our condition as a member of the monster; they do not, but boast of their purity and their innocence.

The Catholic Church is the great head of this monster. Other churches are merely limbs. The Catholic Church, however, is the only Church which has a *soul*, or a real principle of activity within it. The constitution of the English Church renders it inoperative. This fact is strongly urged by Mr. Newman, rector of St. Mary's, Oxford, the leader of the new Catholic party in the Church of England, in a work lately

published by him, "On the Prophetical Office of the Church," in which he declares some striking truths respecting the Church of England, as it is, and as it should be. The Church of England is theologically dead. It was dead born; it died as soon as the Articles were subscribed; it could do no more. It cannot progress, learn, change, or improve—it can only intrigue and dispute about tithes and vested rights, and procure Acts of Parliament to secure its temporal possessions, but as to its real theological character, it is a dead-born child, of which it cannot be said, as was said of its master, that "he grew in wisdom and stature, and in favour with God and man."

The Church of Scotland is in a similar predicament, though somewhat more consolidated, by having a general assembly of clergy; but an assembly of clergy is not a church, neither does the association of the elders with the clergy constitute a church. Clergymen and elders are not the Church of Christ. The people are the church. But the people of Scotland have no positive membership of what is called their Church. The elders are self-elected, that is, when a vacancy occurs, the remaining elders fill it up spontaneously. They read out the name of the person chosen, as they proclaim the bans of marriage, inviting objectors to state their reasons; but this is a mere form, and is, we believe, frequently omitted. But the people care nothing at all about it; neither do they regard the assembly as having any theological authority. Each man thinks for himself, and pays no respect to any decision of the Church. The Church knows this, and seldom interferes with any thing but its own money matters, and political privileges; and any man, who has plenty of money, and common politeness and decency, though he be a professed infidel, drunkard, and fornicator, may be honoured by half a dozen clergymen weekly at his table, in any of the cities or large towns of Caledonia. The fawning and patron-seeking spirit of the Scotch students, also, is notorious; and now that the people have a sort of veto on the election of a clergyman, the students have turned round to make their obedience to the people, by learning their sermons by rote, and spending two days, or more, in committing a discourse to memory, that they may deceive the people with the idea of speaking extempore. It is all, *en masse*, a mere affair of the intellect; as to heart and moral, there is as little as among a troop of savages.

All other Protestant churches are similarly circumstanced. The Catholics are only a little better. They, at least as Mr. Newman says, have a definable constitution, in respect to authority. Although one party says the Pope alone has authority, and the other the Pope in Council, they all agree that the Pope, with his Council, constitutes theological authority. What is the use of a Church at all, if it has not theological authority? What can it do? It can only, like the Wesleyan junta, grant the privilege of raising collections in a district, or moderate calls to churches, i. e. act the part of an attorney, in transacting secular business. Such are all the Protestant sects—attorney churches. The Church of Rome, as head of all, claims, as a head ought to claim, the living spirit of authority, infallible authority. Moreover, as the reader may see from another article in this week's number, it claims the power of working miracles occasionally, and *does work* them, so as to puzzle the Protestants

amazingly. But as each party believes *its own*, and *not another's*, the Protestant scribes easily contrive to obliterate all remembrance of these miracles, by the literary dust of pamphlets and newspaper paragraphs, which, acting upon the sectarian spirit of the party addressed, easily mystify the mind, and create doubts, and thus bring back the wandering spirit just to where it set out.

The author of "Remarks on the late Miracle, in a Letter to Dr. Doyle," unable to deny the overwhelming evidence which the Doctor and his friends adduced, candidly acknowledges the miracle in dispute (Miss Lalor's extraordinary cure of six years' dumbness), and other miracles of the Catholic Church, but infers from this that it must be Antichrist! Now, there is really a great deal of sound sense in this. St. Paul positively says that Antichrist should work miracles "With all power, and signs, and *lying* wonders." It is evident, here, that the word *lying* (pseudous) does not mean *unreal*, but mendacious or deceiving. The wonder is real; but it is accompanied by a deceitful doctrine. The spirit of truth has not come, although there is a commission to do occasionally strange things. The reasoning of this author, we say, is very consistent, but it is strangely in discord with his Protestant brethren, who deny the miracle, jealous of the privilege of the Catholic Church, as if envious of the honour of being the Man of Sin, and the Thaumaturgus or Wonder Worker! This author met with considerable encouragement; his pamphlet went through several editions. The public saw more truth in it than in the scurrilous productions of the "Imposture" gentlemen. One of these latter, a Scotch clergyman, Mr. Finlayson, published what he called a refutation of the miracle at Ranelagh convent; but although his book was published by the very best publisher in the country (Blackwood), in 1824, and has lain for years in the British Museum, till it has gathered dust behind and before, within and without, we cut open every leaf of it in the year 1837! A miserable production it is—so full of passion, that the author confounds times and places, and persons, so strangely, that we could not make a connected narrative out of it. We could only perceive that he was a bitter enemy of Roman Catholicism, and willing to impute every or any baseness to every or any man who belongs to the Catholic Church. So do not we? One of the most amiable and liberal minded men we ever met was an Irish Catholic Priest, with whom, when he was in London, we had the pleasure of spending many happy hours. We can say the same of both Scotch and English clergymen. We have known good men of all persuasions, and are not inclined to teach such uncharitable doctrines.—Truth lies somewhere else than in "Imposture." We do not deny imposture; but we deny that it will solve all the questions to which it has been applied; and the question of miracles is one of those.

But, as the author above alluded to observes, this miracle-working is the craft of the deceiver who set up the church as it is, and gave it a mission to fulfil. That mission has an end; and a new church succeeds. What is the use of working a miracle on a poor invalid, restoring a withered arm, or a decayed leg? The use, when the cure is an undoubted fact, is but a deception after all. These diseases form but a small fraction of the evils of life. The greatest of all evils are social evils—small houses and large families, with little bread, and fear of want. These are greater evils than withered arms. Has the church removed these evils? If so, its miracles are not *lying* miracles—they are true miracles. But the old church has no such mission: it is a lying church. There are greater miracles than these to come: "He that believeth on me, the works that I do, shall he do also; and *greater works* than these shall he do, because I go unto my Father." These cures are merely types of greater cures; the church is a progressive institution; it begins at the bottom of the scale; it works first with childish things, and rises at last to full maturity—but the full maturity is the removal of social evils; this is its final destiny. Every thing it does, previous to this, is a deception—a shadow of a power to be developed in futurity.

But we do not expect that the old church will become the new—that is, take the lead in Reformation. When Lord John Russell replied to Mr. Wakely, a few days ago, he expressed

our meaning very forcibly when he said that he *personally* could not go beyond the Reform Bill; he had introduced that measure, and *by* that measure he would stand. But if the people of England wanted something more, they might dispense with his services, and supplant him with another more conformable to their own spirit. This was perfectly just and sober. Each man, as an individual, has what the French call a "Mission;" very few have two missions. The life of man is not long enough for more; and those who do fulfil two missions are always charged with inconsistency and apostasy, and deception; so that it is more consistent with the rules of strict discipline that a man should have one mission only, and when that is accomplished, that he should give place to his successor. Russell, in this respect, speaks like a true philosopher, and we have no doubt calmly awaits his destiny. 'Tis so, also, with the church. The church will adhere to its present dogma and antiquated standard: a new church must arise, and put out the old; the old will stand till this new is strong enough to supplant it, and no longer. This is the law both for the Whigs and the church—you may rail at them as you please; this is the law. It is the law, also, of the teeth—the first teeth of a child are not the teeth intended by Nature to serve the vigour of manhood, but the second teeth are late of growth, and the first teeth supply their place till they are forced out by the pressure of the second. The first teeth are not *expelled* till the second are formed. When the second church is formed, it will expel the first. But where is the second? No where. Protestantism is not a church; it consists only of a paltry nest of sectarians and schismatics. There is no church but one—the Catholic, and that only works *lying* wonders; it only cures headaches and white swellings, paralysis, &c. It does not cure the social diseases of the people—it cures such diseases as Jesus of Nazareth cured: not the diseases which the second Messiah will cure—the diseases of society. "He shall judge thy people with righteousness, and thy poor with judgment. He shall judge the poor of the people, he shall save the children of the needy, and shall break in pieces the oppressor; he shall deliver the needy when he crieth, the poor also, and him that hath no helper," &c. These blessings are reserved for the second Advent. It is Antichrist who cures the white swellings, and suffers old society to remain.

The conformity of this doctrine of Christianity, with the past and prospective history of man is so evident that it is impossible that a new system of society can be raised upon the ruins of Christianity. It is impossible to improve the political condition of men, without finding the type and the sanction in the bible itself. You cannot go beyond the Bible in political generosity, its immortality is therefore certain. Did the Bible stop at the present social or rather unsocial state; Did it positively assert that you could not go beyond it, that there was no hope of emendation; then there might have been some reason for believing that its days were numbered; but we see a new triumph, a totally new field of action in reserve for Christianity; it has not finished its course. It has only fulfilled one half of its mission. The tide is beginning to turn, but the power is as great as ever; the tendency only is altered, the direction is changed. The doctrine must be subservient to the moral.

The moral may be learned from Christ's sermon on the mount, it is merely the social doctrine, you can make nothing else of it. "Lay not up to yourselves treasures on earth, where moth and rust do corrupt, and where thieves do break through and steal, &c." Is this the spirit of present society? Is it the spirit of the Christian clergy? Have they the impudence to maintain that it is so? Then, we have the boldness, in the name of Christ, to declare that they have abused their master's doctrine, and are deceivers of the people. We shall ultimately prevail; we have no fanatical feeling about us; we are not expecting miracles and signs; we expect to work with simple natural weapons; but those weapons will finally prevail, and the Christianity we now teach will, by future ages, be declared the second gospel—the gospel of glad tidings to the poor, contained in embryo, in the gospel of Jesus, but destined to be hid, like the leaven in the wheat, until the doctrinal and controversial church of Antichrist had fulfilled its mission.

REFORMATION IN RELIGION, AND THE PROGRESS OF INFIDELITY.

THERE is a reaction of some kind taking place both in politics and religion; what it really is, is very difficult to determine. Time only can demonstrate. But since we arrived in this huge metropolis, we see a most remarkable change in the outward manifestation of principles. The boldness and recklessness of speech, which characterised the beginning of the reign of William, have gradually died off; and though religious faith has not, so far as we can judge, made a step of progress, gross irreligion, and ignorant and illogical buffoonery, have been put to shame by the moral censorship of public opinion. Men, we believe, are more reasonably disposed than they were in the dark ages of mere infidelity, and many, with whom we associate, seem willing to acknowledge, that there is a progressive plan in human society, as there is in a single vegetable or animal, and that even religious institutions may be established in one age, by Divine authority, to be destroyed in another.

There is a perceptible progress in the leaders of the infidel party, of which we are silent but impassioned spectators. It is called apostasy by some, who are obstinate adherents of the old out-and-out infidelity, which resorts to chaos as a first principle, and derives all its intellectual satisfaction, all the props of its faith, from the demonstrations of chance; but to us it is a resurrection from the death of the mind, and a tendency to a new and a more certain view of the wonders of Nature, and the destinies of man.

There is very little, indeed, almost nothing at all satisfactory, but the tendency is evident, and the crisis to which the human mind has arrived, not to be disputed. Infidelity has gained a considerable victory. It has gained a free press, and a moral, instead of a magisterial, censorship. The writer upon religious subjects is now no more responsible to what is vulgarly called a court of justice. He is responsible to his readers only; and this responsibility has produced a greater refinement of style, and delicacy of expression, than it was possible for the fines, and the prisons, and the tread-mills, to enforce. For the last hundred years, there has not been a period, however short, in which less repulsive language was employed by the public press. This we owe to the struggle of infidelity for liberty to speak.

Infidelity, moreover, has directed the attention of mankind to social or political morality, in a manner never before equalled by the Church, in any age, so far as regards practical religion. If it has neglected the individual religion of mere doctrine or opinion, it has cultivated, with the utmost assiduity, the religion of social relationship. It has taught the purest doctrines of brotherly love, and reciprocal dependence. It has taught humility to the proud, and endeavoured, with a laudable zeal, to give exaltation to the humble. It has striven, with all its might, to raise the valleys, and lower the mountains, of social and political inequality. It has claimed protection for the weak, instruction for the ignorant, food for the hungry, and employment for the idle and the able-bodied. It is only the basest wickedness which can have the effrontery to deny that the infidel spirit has been most conspicuous, in demanding these rights, and organising the means for attaining them. Still it has only gained the confidence of the people in part. The public will suffer it, with impunity, to caricature the clergy, to destroy the tithe, and the offering, and the rate of the Church; it will suffer it to point out the moral defects of the clergy as a body—their inattention to duty, their disinclination to teach, their greediness of gain, and aversion to labour—the ignorance of the people, combined with ample provision for national instruction, &c.; but the public cannot, and will not encourage the spirit of infidelity to declare that Christianity itself is incapable of being made subservient to the moral and intellectual welfare of the people, or to affirm that the historical evidence of Christianity is to be put on a par with the incoherent stories of heathen mythology.

We believe the historical question of Christianity is almost settled. We do not expect to see that question ever more disturb the peace of society; and fortunate for society that so it is. There is something of greater importance to demand the

attention of future generations. It is the moral spirit of religion. Men have hitherto been wrangling with its intellectual spirit, and they have brought forth nothing but blood and misery. It is an unhappy strife—a strife, too, which, when consummated by victory, proves no gain even to the conquerors. Our own opinion is, that *intellectually*, that is, in so far as the history of the Church is concerned, the clergy are triumphant. The historical learning of the Christian clergy is unrivalled in the history of man. History is their fort, and there is not a particle of literary dust, which bears upon the history of the Christian Church, which has not been disturbed again and again, by contending and jealous parties, to satisfy the curious and insatiable spirit of research into the records of antiquity. Opposition has fled before it; so that the following passage from Dr. Wiseman's lectures on the connection between science and religion, may be strictly applied to every department of ecclesiastical history; excluding such traditions or revelations, as the story of creation and the flood. Speaking of Egyptian antiquities, he says:—

“What a waste of talents, time, and learning, has not truth to deplore, in tracing the history of this memorable controversy! Over what a glittering heap of ruined systems has not error to mourn! Systems, where all was brilliant, all was imposing, all was confident; but where all was, at the same time, hollow, and brittle, and unsound. We have, indeed, many cases, where a sportive and malicious fraud has deluded the ingenuity and study of the antiquary, and made him pay, like Scriblerus, to modern rust the veneration and homage reserved to that of antiquity. But never before did the world see an instance, where a spirit of giddiness had so completely invaded such a large portion of learned and able men, as that they should ascribe countless ages to monuments comparatively modern, undeterred by the fall of system after system.

And still engage

Within the same arena, where they see

Their fellows fall before like leaves of the same tree.

Childe Harold, c. 4, § 94.

Never, in fact, did error bear more completely its hydra form. Each head was cut off the moment it appeared, but a new one rose instantly at its side, equally bold and equally speaking great things. For more than twenty years this gall-ing warfare continued; but as prejudice was gradually exhausted, and true science gained strength, the vital powers of the monster became less vigorous, and the wound which it received more fatal. Its last gasp has long since died away; the last flap of its mortal struggle has ceased, and only existing among the records of antiquity, it can now present no more terrors to the simple and timid than the “gaunt anatomy,” or well preserved coils of some desert monster in the cabinets of the curious.”—*Lecture 8*, p. 107.

It would be very strange, indeed, if the clergy were wrong upon every subject; this is so decidedly at variance with the equality of Nature, that it should be rejected at once. Even the savage has his strong points, upon which he excels in moral judgment the civilised. The clergy have their strong points also, and history is one; there they are victorious, but what do they gain by their victory? Nothing. They are vanquished in the moral and spirit of religion, and therefore they must fall. They have done their work; they have fulfilled their mission, and they have done it well. Their true mission was to lay the historical basis of Christianity; they have attempted more than this, their mission, but they could not fulfil it. Why? because they had not the spirit given them; they are merely historical and classical apostles—and the pause that is now experienced in the historical struggle, the almost undisputed sovereignty which they now hold in that department, is to us a very intelligible symptom that their mission is fulfilled—for, with all their victory, the angel of the Everlasting Gospel has already proclaimed to mankind, and all Europe is ringing with the sound, that the Christian clergy are merely presumptuous pretenders to the apostleship of the Gospel in its character of glad tidings to the poor. They belong only to the first era of the church, which is the era of moral apostasy.

That which succeeds the teaching of the clergy must take

possession of what they have *gained*, as well as of what they have failed to obtain. If the clergy are only to be dispossessed by historical controversy, then they are safe in their tenements; the church is an everlasting entail to them, and their spiritual offspring, for there are few, if any, of the sciences more complete than ecclesiastical history; but if they are now called publicly, and zealously to account for the moral and spirit of the gospel—granting them their historical victory—then, we say, the gospel may speedily make the poor rejoice in the fulfilment of that promise which the church has made them in all ages, but never yet accomplished.

We have two books before us at present written by Ultra-liberals—perhaps we do not offend them if we call them both infidels; one is professedly an infidel. We do not mean to review them, but merely to allude to the spirit of each. The one is a letter by Richard Carlile to the Bishop of Norwich, and the other a work called “A New Sanctuary of Thought and Science,” by a Student of Realities—the same, we believe, who wrote the Catechism in a previous number of the *Shepherd*. We never read any production of Carlile’s with greater satisfaction than his letter to the Bishop of Norwich. It is an admirable letter; the moral of it is infinitely superior to the moral of the Christian church, and the reform he proposes is calculated materially to promote at least the moral and intellectual welfare of the people; but it proceeds upon the principle of illegitimizing the Bible; but for this one peculiarity, and the unconsciousness of the universal parent, we would regard it as unanswerable. The New Sanctuary proceeds upon a different principle, yet seeks the same end—a rejection of the Historical Bible, and a casting overboard all mystical notions. The Rejection of the Historical Bible, we have already shown, is no easy matter; for ourselves we really and devoutly regard it as impossible; and as for the abandonment of mystery, all men are anxious to get rid of it; but how to get rid of it is the query. Now we cannot understand how mystery is got rid of by representing Nature as under the direction of chance, or the creative power of Nature, as working without conscious purpose. There is no greater mystery than this. We do not see any mystery in the idea of a universal, conscious, Omnipresent Power, directing all things according to a determined plan, and making even the wrath and the folly of man to praise him, but we certainly see a very great amount of mystery in a mechanical universe without a mind to regulate it. This we call chaos, and chaos is, of necessity, unintelligible.

We conclude by quoting a stray passage from each of the two works, which, we think, conveys a favourable idea of the speech of each. The first is from Mr. Carlile’s:—

“I did not—I do not—my Lord, say that you ‘have followed cunningly devised fables;’ but I did, and do say, that in reading the Bible, as a piece of human history relating to the affairs of particular men, as limited to time and place, your Lordship, and all like you, have perverted the Word of God into a fable—a book of science, inspiration, and revelation, into a book of superstition. Have you examined both sides of this question before giving an opinion? The Word of God must be a scriptural or oral description of the works of God. Do you, my Lord, so read and teach the Bible? I do; but, as far as I see, your Lordship does not. I repeat, that the fable is not in the Bible; but your mistaken teaching has perverted the language of the Bible into a fable.”

We believe Carlile was never nearer the truth than when he wrote the above paragraph. The spirit of a book is always superior to the mere matter-of-fact of it. But the spirit may be insisted upon without denying the letter. Were Carlile merely to admit the dry fact, and preach the spirit, he would become one of the most notable members of the body of Christ; both his head and his heart are good, and there is not a more devoted adherent to principle in the country than himself.

The other work is somewhat more abstract and difficult to comprehend as a whole, but it contains many valuable truths, and the following short sentence we select, as comprising within itself a complete science:—

“Each great period of the history of man has had its mobile of action, its worship, its faith, in short, its degree of knowledge

true or false; and it was at all periods, the harmony of human feelings with faith or knowledge, that gave to each period its moral strength.”

This is true; the *natural* feelings of humanity must be in harmony with science, to produce power, peace, and happiness, in other words, unity. But the author also tells us (page 185) that the reasoning faculties should be called upon to subdue “*instinctive natural superstition*.” Now, this is the very superstition that ought to be encouraged. Depend upon it, we shall never do much good by working against Nature. It is artificial superstition which ought to be attacked; and here we blame the infidel party most, decidedly, in attempting to raise an artificial structure of imperfect philosophy on the ruins of many natural instinctive feelings. This is their weakness; natural instinctive feelings are the roots of all virtuous activities; they never did harm, except by the restrictions of bigotry, and intolerance, attempting to give them a wrong direction. The feelings will change and modify with the mental operations. If let alone, they will always be in harmony with the state of the mind; but if laws are imposed upon feelings, and systems cut out for them, whether by believers or infidels, human nature is spoiled, the handy work of the Almighty is dishonoured.

A MALTHUSIAN RIDDLE.

WHAT can Mr. Malthus mean by the following passage?—

“Among the higher ranks of society, we have not much reason to apprehend the too great frequency of marriage, though the circulation of juster notions on this subject might, even in this part of the community, do much good, and prevent many unhappy marriages; yet, whether we make particular exertions for this purpose or not, we may rest assured, that the degree of proper pride and spirit of independence, almost invariably connected with education and a certain rank in life, will secure the operation of the prudential check to marriage to a considerable extent. All that society can reasonably require of its members is, that they should not have families without being able to support them. This may be fairly enjoined, as a positive duty. *Every restraint beyond this must be considered as a matter of choice and taste*; but from what we already know of the habits which prevail among the higher ranks of life, we have reason to think that *little more* is wanted to attain the object required, than to award a greater degree of respect and *liberty to single women*, and to place them nearer upon a level with married women; a change which, independently of any particular purpose in view, the plainest principles of equity seem to demand.”

The good or the evil of this passage depends entirely on the meaning of it. But, whatever meaning you put on it, it may be regarded as an epitome of the Malthusian doctrine, which has two meanings, a bad and a good. The Whigs have adopted the former. What Malthus himself really meant, will, probably, remain for ever a secret. But what could Malthus know of the *habits* of the higher classes, connected with the subject of which he treated? He certainly could not profess to be ignorant of the notorious fact, that the higher classes are the great patrons of prostitution; that the sons of the nobility and gentry, who employ the prudential check of celibacy, are not monks. What, then, does he mean by giving greater liberty to single women? Does he mean to confer the same prudential privileges upon them, as upon single men? The question is important; for, as the Whigs have interpreted Malthus, this doctrine is likely to make society a brothel.

Sadler and Godwin, the two great opponents of Malthus, would rail at this doctrine most unconditionally, and preach up marriage and population unlimited. It is amusing to read these three clever and excellent men keenly contending against each others’ facts, for facts they all have—most undoubted facts. Malthus says, poverty and the fear of poverty, education, pride, and the spirit of rank, are the checks to population. Sadler says, this is impeaching the moral goodness of God. Yet Malthus states merely a fact—What is it that prevents men from marrying? fear, pecuniary circumstances, poverty, education. But Sadler meets it with another fact, viz., that Providence itself provides a check

of a more simple nature, by diminishing the reproductive power in the rich; thus Dr. Perceval states, that, in the parish of Dunmore, in Essex, there were 262 poor families, with 466 children, and 116 families above them in rank with only 120 children. This is merely a specimen. Allowing, therefore, the fact, what is the inference? the inference is, that in order to diminish the reproductive power of the poor one-half, you must raise them to the same rank as the rich; and if you encourage marriage at the same time, you increase the means of reproduction by marriage as much as you diminish them by wealth. But did Sadler insist upon the means of raising the poor to an equality with the unprolific rich? No: his philosophy did not go so high. He trusted to Providence and charity! Now, Providence, in the present state of society, uses the Malthusian check, viz., misery; and, as Fourier says, will use it as long as men use the present political system of dissociation; and, as for charity, it encourages dependence. Godwin saw farther than either of these two gentlemen—for he saw the error of the social state, and laid the foundation of Owenism in England. Almost all Owen's doctrine may be gathered from Godwin's "Political Justice." Malthus said that "the principal cause of want and unhappiness is only indirectly connected with government, and totally beyond its power directly to remove, and that it depends on the conduct of the poor themselves." Godwin disputes this, and shows the possibility of a better species of government. Now, both gentlemen are right; for government can do nothing unless the people co-operate, therefore Malthus is right; and the people can do nothing unless the government co-operate, therefore Godwin is right. Moreover, Providence provides a check when men are rich, and a check when they are poor—let them marry and beget as they please. Therefore Sadler is right. And, moreover, many bachelors and old maids save themselves and others a great deal of trouble by non-production, therefore Malthus is right, and Miss Martineau is right, and all are right; and all wrong, when they do not make a distinction between the two states of society. Malthus writes for the old world; he has no idea of a social state. His doctrine is adapted for the devil's kingdom, and a suitable and true doctrine it is for that kingdom. Godwin writes for a social state, and speaks truth for a social state; but, in speaking truth for a social state, he had no occasion to deny that Malthus spoke truth for the society for which he wrote. Every man and woman in the country is a Malthusian; they all allow that a large family is a greater burden than a small family, and they are afraid to marry till they see the means of providing for a family. This is Malthus' fundamental fact, and he merely wants to convert this natural feeling into a political measure. In this Malthus went beyond his mission; he ought rather to have endeavoured to discover a political measure that would remove the fear of marriage. Here Godwin has the advantage of Malthus. Malthus' doctrine leads to prostitution, theft, and political cruelty in the present state of society; Sadler's leads to indulgence, idleness, and moral degeneracy; and Godwin's speaks of another state of society altogether.

The three combatants may be thus characterized:—
 1st MALTHUS, correct for the old world; but his doctrine leads to activity, accompanied with misery.

SADLER, correct for the old world; but his doctrines lead to passivity, accompanied with misery.

GODWIN contemplates a new order of society, in which Sadler would prove right, and Malthus not wrong, and both would prove innocent in doctrine, as they really were at heart innocent of any evil intention.

Malthus was a clergyman—Sadler an evangelical christian—Godwin an infidel.

FOURIER.

WE have now finished what we intended to give of the Social System of Charles Fourier, and whilst we were in the act of translating and publishing the best outline of the comprehensive theory that has ever appeared in print, the old gentleman himself departed from this terrestrial scene of misery, to enter, we hope, a better, where he will find his philosophy in

complete and active operation, both in spirit and matter. We heard of his death more than a month ago, but dared not announce it, lest our information should prove incorrect. It has, within these few days, been confirmed by one of his most enthusiastic admirers, a lady of high moral and intellectual eminence, who pines in secret over the fallen condition of man, and burns with a consuming fire of zeal for a moral reformation, which she has in vain attempted to accomplish. Our translation was hastily performed; the compositors often setting one paragraph, whilst we were writing the succeeding. We believe, however, it is in general correct, and quite as simple and intelligible, though not so elaborately correct and forcible in English, as the original is in French. Indulgence we do not crave from our readers for any imperfection in the performance of our task—we merely state a fact. Whilst Fourier was leaving the world of shadows, Owen was dining with Prince Metternich in Vienna, no doubt endeavouring to convert the great diplomatist to his social views—but endeavouring only. Even success would be failure. What can Prince Metternich do against the aristocracy of Europe? His whole strength lies in his servility to the aristocratic spirit. Let that servility cease, or be converted into hostility, and Prince Metternich is a feather in the storm of baronial domination. There is no way of changing society, but through the public mind; and, to do it well, patience is requisite. The work will, and must go on, but it will never be established till society is well experienced in political folly, and Radicals are tired of looking to paltry measures of a local or partial interest for positive amelioration. We are in the same relative position as the early Christians, and are striving for a new moral as they for a new doctrinal religion.

PRINCE HOHENLOE.

WE have often been asked our opinion of miracles; we have invariably, for many years past, given the same reply; namely, that we regard the Christian church as having been originally established by miracles, but that miracles are not a test of truth. They are merely a credential for the individual, showing that he has a commission, but that commission may be to propound a riddle and not to expound it. There is nothing at all unreasonable in supposing that a religion, a metaphysical institution, such as Christianity, should have been *thus* introduced into society; indeed, we cannot imagine any other mode of doing it. The evil produced, so far from being an argument against the employment of miracle, is an argument in its favour, inasmuch as real positive good would stand of itself; but evil requires some additional and extraordinary prop to raise and support it; when once raised the original raising power becomes less necessary.

But was that original raising power wholly withdrawn, according to Dr. Middleton, at the death of the apostles? The certainty of it most probably was, but we deny that the occasional display of it ever has been withdrawn. We are firm believers in the power of faith. It is the best medicine the ignorant physician can use, but contention kills it. Thus, faith is gradually dying; but wherever it is powerfully developed, there extraordinary cures will be performed by its instrumentality. There is more faith in the Roman Catholic Church than perhaps in any other. The authority, antiquity, pomp, circumstance, and universality of that church are very imposing, and the ignorance and devotion of many of its members far exceed anything to be witnessed in a Protestant conventicle. It is an admirable institution for miracles, and miracles it no doubt has; not unnatural prodigies, but pure natural miracles, real cures performed by pure faith. We know from experience the power of mental and moral excitement; it will produce the same effect as the apothecary's medicine; it will relax like one drug, and bind like another; and if relaxation and constipation be remedies, natural remedies, why should not faith be a remedy?

"Medical men," says Dr. Badeley, in his account of one of Prince Hohenloe's cures, "impute the extraordinary cures performed by Louthembourg, animal magnetism, charms, metallic tractors, and the prayers of Prince Hohenloe to the

influence of the mind, whilst others explain them by spiritual agency, or miracles, or disbelieve them entirely, and stigmatize them ignorantly and illiberally as 'perfect deceit.' Catholics and Protestants, however, unite at last in one opinion, that *perfect faith and confidence in the remedy are indispensable to its success.*" Even this, however, we dispute, for the cures of children must be totally disconnected with faith in the patient at least, and when the curator is a dead saint, an old bone or a shred of a garment, and the patient an infant, where is the faith? As for the argument of imposture, we despise it, so thoroughly, as a general argument, applicable to all cases, that we pity the heart as much as the intellect of the man who employs it.

We will quote Dr. Badeley's miracle, merely for a specimen of many others:

"On the 7th December, 1820, Miss Barbara O'Connor, a nun, in the convent at Newhall, near Chelmsford, aged thirty, was suddenly attacked, without any evident cause, with a pain in the ball of the right thumb, which rapidly increased, and was succeeded by a swelling of the whole hand and arm as far as the elbow. It soon became red, and painful to the touch. Mr. Barlow, the skilful surgeon to the convent, was sent for, and applied leeches, lotions, blisters, &c."

The doctor then gives a professional account of the swelling and surgical operations performed, but the complaint still continued virulent for a year and a half. Prince Hohenloe was then written to at Bamberg. His answer is as follows:—

"To the Religious Nuns in England.

"On the 3d of May, at eight o'clock, I will offer, in compliance with your request, my prayers for your recovery. Having made your confession and communicated, offer up your own also with that fervency of devotion, and entire faith which we owe to our Redeemer, Jesus Christ. Stir up from the bottom of your heart the divine virtues of true repentance, of Christian charity to all men, of firm belief that your prayers will be favourably received, and a steadfast resolution to lead an exemplary life to the end, that you may continue in a state of grace.

"Accept the assurance of my regard,

"PRINCE ALEXANDER HOHENLOE."

"On the 3d of May she went through the religious process prescribed by the Prince. Mass being nearly ended, Miss O'Connor, not finding the immediate relief she expected, exclaimed, "Thy will be done, O Lord! thou hast not thought me worthy of this cure." Almost immediately after, she felt an extraordinary sensation through her whole arm to the ends of her fingers. The pain instantly left her, and the swelling gradually subsided; but it was some weeks before the hand resumed its natural size and shape. Now, I can perceive no difference from the other (June 30th). The general reports that her arm was paralytic, and that both hand and arm were again as bad as ever, are without any foundation.

"The anonymous authors of some late publications have gone so far as to declare their opinion, that "*Miss O'Connor's case is a piece of deceit from the beginning to the end.*" Others have asserted that it is "*an imposition on the public,*" and Mr. Barlow and myself (two Protestants) are included in the confederacy!"

This was to be expected. Of course it is much easier to believe that a white swelling could be feigned, and surgical operations all sham for a year and a half, than that a devotional simple-hearted female should receive sudden relief by the prayer of faith! There is some philosophy in the belief, but none in the unbelief.

It is laughable to see the zeal with which a Protestant parson will join an infidel to cry down a Catholic miracle. If you wish to cry down the miracles of Christ and his apostles, you have no occasion to quote Paine or Voltaire, or any other modern sceptic; merely quote the Protestant parsons, they will laugh the whole story to scorn, and when scorn fails, they will cry out "imposture;" and when imposture seems doubtful of success, they will pity the poor deluded fools who believe such trash. Now, in our humble and candid opinion, these reverend gentlemen are the enemies of Christ, and ruining their own reputation. If evidence so very powerful, so overwhelming as that which can

be adduced for many Catholic miracles is *all* false, then we say no evidence is worth a fig even in science, no man's authority is worth quoting, no book is worth reading, and knowledge itself is a delusion.

What is very singular, we say, Protestant clergymen wrote against these miracles, and scoffed at them. Witness the following from a Scotch clergyman: "It would appear that the Prince is increasing in "Power with God." Formerly, repeated acts of devotion were deemed by him requisite to draw down the supernatural manifestation of divine power on a single individual; but now (and who can help shuddering at the impiety and presumption of a worm of the earth?), he multiplies beyond all calculation his pretensions with God, and his shameless delusions of ignorant men. Now, with the most *unbounded sympathy for suffering humanity*, he appoints three days for all without limitation, let their cases be what they may, let them but join their intentions with his on any one of these days at the hour prescribed. And this is all that is required to obtain from God immediate relief from the thousand natural shocks that flesh is heir to! Gracious Heaven! and is it come to this! Is this the illumination of the age in which we live!"

Now, is this clergyman (the Rev. Joseph Finlayson) an honest man? His own church regularly prays for the sick: he himself, when the precursor reads out "the prayers of this congregation are requested for A. B., &c." prays for the recovery of the person recommended. Does he regard his prayer as a deception? We never heard of the Scotch prayers for the sick proving effectual; the reason is obvious—the clergyman does not believe in them, and the people have as little faith. The Catholics are consistent; they pray, *because* they believe, and they follow the advice of the Apostle James, who says, "the prayer of faith shall save the sick." But this clergyman, and all like him, are infidels—practical infidels. The English Church has also a form of prayer for the sick. What is the use of it? If it produces no cures it would be better to prescribe Morison's Pills, or Daffy's Elixir. But Dr. Doyle and Dr. Wiseman not only declare with all Catholics that *their* prayers are useful, but maintain that the Catholic Church only has this privilege of working cures. This we deny. Wherever the faith is cultivated, the effects will be similar; but Protestantism has no faith.

Dr. Doyle (Catholic Bishop) very happily satirizes the never-ending ascription of such cures to the nerves. "Oh, happy nerves! were Erasmus now living, he would not select folly as a theme for his praise, and pass by the unspeakable beauty and convenience of the nervous system! This system, which can kill and cure with equal facility, or administer relief to the dumb and hypochondriac, which can rescue life from the grasp of apoplexy, and say to him or her who has been bowed down with infirmity for years, "take up thy bed and walk." *Le medecin malgre lui*, of Moliere, was unacquainted with it, or bleeding and hot water would not have been his only specifics, &c."

"Miss Dowell is so diseased for months, as to be enfeebled to such a degree, that the very movement of her frame might, in the opinion of her physicians, produce dissolution. Relief is sought from God, by those means which, in all ages, have been used, agreeably to his own command, in order to obtain mercy. She rises, and almost takes up her bed and walks; and this is nerves! To suppose so, is not to be *oreduulous*, but it is to hoodwink faith and reason, and bring them into captivity to prejudice. I have seen an old woman, who had been, perhaps for twenty years, stooped down to the earth almost, with some disease, probably of the spine, and in whom poverty, cold, want, and age, weakened much the *elasticity of the nerves*. She prayed with an humble faith, and stood erect; but why should not some hypothesis be devised, to show that her cure was a mistake, or that her disease belonged to some undiscovered class?"—*Defence of the Vindication of the Civil and Religious Principles of the Irish Catholics.*

This must gail the Protestants, for they cannot dispute the facts, without impairing their own faith, and throwing odium and the cloak of hypocrisy over their own "prayers for the sick." They are obliged to be profane. Who can find fault with the piety of Hohenloe's letter, above quoted, and call himself a Christian? An infidel may laugh, and scoff, and

cry "imposture, deceit, humbug," &c., but it ill becomes a professor of Christianity to dispute the truth of what Christ himself positively promised should continue in the Church *till the end*. We do not consider these miracles, nay, not even *bona fide* resurrections, and restoring of lost limbs, as evidences of final truth. But as both Protestants and Catholics do regard miracles as a test of truth, doctrinal truth, we sincerely think that, in this miracle question, the Catholics have the best of the argument, and that the Protestants are practical infidels, with a false profession of faith.

The following is quoted from Dr. Doyle's Defence of J. K. L., &c.

"At Wurzburg he commenced those extraordinary actions which have astonished, and are astonishing, all the nations of Europe.

"Francis Nicholas Baur, Vicar and Dominicalis Major of the ancient Chapter of Wurzburg, has given, in twelve letters, an authentic account of the remarkable occurrences performed by the Prince, during his residence of twenty-four days in that city.

"Over his bed hangs the identical crucifix used by the great St. Francis Xavier, in the Indies, a present from his Holiness Pius the Seventh. He has chosen for his companion a man truly religious, of low condition, named Michel, of his own country, who unites with him in prayer, previous to the working of his miracles. These do not consist of long sounding words, of formal bombast, and multiplied titles, such as the heathens made to their gods, but with faith and fervour, he says with the Apostles, "In the name of Jesus, arise, thy faith hath healed thee."

"With perfect confidence he has restored persons declared incurable. He has made the blind to see, the deaf to hear, the lame to walk, and paralytics he has perfectly cured.

"The number of cures performed in the above-mentioned city, and which are unregistered, are more than one hundred. Among these are the Princess Matilda of Schwartzburg, who was cured, after being lame from her eighth to her seventeenth year. Eighty thousand florins had been spent in medical advice for her, and fourteen days before the Prince saw her, her life was despaired of.

"It was only with the most violent pain that she could lie in a horizontal position, and only by means of a machine, constructed by Mr. Heine, could she be something freer from pain in bed, because it supported her, and brought her nearer to a perpendicular direction; and in this state the Prince of Hohenloe found her, where praying with him and his disciple, Martin Michel, and with full confidence in God, at his command to rise, she was instantly cured. She stepped out of bed alone, threw the machine from her, was dressed, and walked afterwards in the court-yard, and in the garden, performed her devotions the next morning in the church, with praises and thanksgiving; visited the garden of the court, and Julius Hospital; and went, on the 24th instant, in company with her Serene Highness the Princess of Lichtenstein, born Princess of Esterhazy, his Serene Highness the Duke of Aremborg, also her uncle, his Serene Highness the Prince of Baar, and others, to the sermon of the Prince of Hohenloe, in the collegiate church of Haug, and continues to this hour perfectly well.

"The public will do well to reflect on this," says Father Baur, "and the more so, as on the preceding day, as well as on the 20th of June, in the morning, the Princess could neither turn herself in bed, nor stand on either of her feet! The Crown Prince of Bavaria, who was deaf, was restored to his hearing.

"On the Prince's way to Wurzburg, he was met by several vehicles full of sick persons. He stopped, got out of his carriage and healed them. In Easleben, he did the same; in Haasfurt, four leagues from Schweinfurt, he healed five persons. We continue to receive intelligence from him.

"He restored two sisters to the use of their limbs, who had not left their beds for ten years. The counsellor, Jacob, who had been confined to his bed for four years, accompanied his deliverer from the third story down to the house door. The upholsterer, M. Kauer, who had been, long ago, given up by the physicians, is seen abroad again. The benefited clergyman, Rev.

Mr. Sollner of Hallstadt, before the residence of the Prince, in the presence of a number of persons, was cured of the gout, as he sat in the carriage, and he immediately alighted, and went through the town on foot. Mr. Deureling, the saddler, can now look after his workmen without stick or crutch, &c.

On the morning of Saturday, the 30th of June, a chaise drove up to Staufenberg's hotel. It was immediately conjectured that it had brought some poor creature in need of help, and actually, an old man, by trade, a butcher, was carried out of it in sheets into the hotel, for all his members were so crippled that he could not be touched with hands. The crowd assembled before the place in the hotel, were astonished to see a person so extremely afflicted, and many said aloud, "If this man be cured the finger of God will be manifest." The whole multitude were full of expectation for the event. After a time, a lady was heard in the hotel, calling out of the window to those in the windows of the adjoining house. "Good God! the man is cured, he can walk already!" The crowd below were now more eager with expectation, when another lady called out to them, "clear the way before the door! the man is coming out, let him have a free passage." The man came out and walked to his chaise; but after driving a little way, he stopped the coachman, and desired him to take him back to the gracious prince, as through excessive joy, he had forgotten to return him thanks.

"In the afternoon, a young man was brought from Burglauer, who had studied divinity here two years, before, but from a disorder in his legs, had lain since that time in constant and excessive pain. His friends in the seminary, had pressed him to come hither; and, they moreover, induced his Serene Highness, as the sick man could not leave his bed in the carriage, to come out to him. He encouraged the sufferer to have great confidence in the power and goodness of God, and then prayed over him, and told him to arise in the name of Jesus. The first time the sick man could not arise, his Serene Highness repeated the prayer, and the man declared that all the pain had left him. The prince prayed a third time, and to the astonishment of the immense crowd assembled before the Staufenberg Hotel, when he called out "Arise," the sick man raised himself upright in his bed. Every man was amazed to think how languid and emaciated had been the state of this man, who now stood before them with a countenance beaming with joy, whereas, a moment before, he had lain to all appearance at the point of death. Both his feet were before quite dead, for pins had been run into his flesh and he felt nothing of them.

"The child of Mr. Gulemann, who was attended by medical men, being entirely blind, was restored on the spot, and to this hour remains blessed with perfect sight.

"The daughter of Mr. Mel, the king's cellarer, who was deaf, ran about the house, crying out for joy, "I can hear perfectly well."

"A man from Schwemusback, who had not been able for eight years to raise himself once in his bed, was brought in a carriage before the residence of the Rev. Prince, who was just about to begin a journey. The Prince was in the greatest haste, but still wished to relieve the afflicted man, and accordingly opened his window, and began to pray from it, desiring the sick person to pray at the same time. After giving him his blessing, he called out to the man to arise. This he could not do, and the prayer was repeated, whereupon the sick man raised himself a little, and declared that he was quite free from pain. The prayer was again repeated, and then the man arose entirely by himself, got out of the vehicle, went from thence to the collegiate church of Haug, and there returned thanks to God for his deliverance. Who would think of pretending that, in this case, there could have been any application of magnetism, when, from the Prince who spoke and prayed from his window up stairs to the sick man, there was so great a distance as to render breathing upon him, and much more touching him, quite impossible."

We must now conclude. These are only a few specimens of miracles wrought in our own days, in the reign of George IV. equal apparently to those of Jesus Christ, and wrought in his name. Yet some will doubt of the existence of Christ, be-

cause of the difficulty attached to the belief of his works! How very contemptible is knowledge! What a paltry thing is philosophy! What is knowledge? Pray, what is it? Your facts or mine? Philosophers will traverse the earth with one set of facts, striving to compel mankind to abandon another set, and they complain of their treatment, and of people's ignorance. What a pity it is they cannot discover their own! There is nothing marvellous in all these stories; to us it is pure nature, simple nature, and would be much more frequent if there were more brotherly love amongst us, and less brawling and wrangling about heterodoxy and orthodoxy, which only make devils of men, by developing the intellectual at the expense of the moral nature. We are not requiring the reader to believe; but we think we have a right to say, that if he refuses other men's testimony, they will pay little respect to his.

But miracles are not confined to the Church of Rome. Valentine Greatrakes was just such another as Prince Hohenloe. But, strange to tell, the English Episcopalian Bishops forbade him to cure the sick in the name of God in their diocese!! The Roman Clergy would probably do the same; they are all alike *meanly jealous* of each other. None of them have got possession of the *Universal* faith. None of them belong to the Universal Church. "Miracles considered abstractedly," says Dr. Doyle, "are not always certain signs of the sanctity of those who work them, or of the truth of their doctrine." This is right. The worker of miracles "must prove his mission from the church his submission to those who rule her." This, also, is right; but where is the church? and is it not probable that all miracles are now imperfect and uncertain, because the church is divided, and its love destroyed? THERE IS A SECRET ABOUT RELIGION WHICH IS YET UNVEILED. Certain, however, we are of this that the church is apostate throughout, and that the Sectarian Spirit is Antichrist in its worst sense. Certain, also, we are, that vulgar infidelity is a delusion, and its pretensions to knowledge and philosophy a farce.

SECTARIAN DIFFERENCES.

(From [Notes to the "Reproof of Brutus."])

The differences among sectaries are thus described by Dr. Heylyn:—

"Worse fared it with the brethren of the separation, who had retired themselves unto Amsterdam, in the former reign, than with their first founders and forefathers, in the Church of England; for, having broken in sunder the bond of peace, they found no possibility of preserving the spirit of unity, one separation growing continually on the neck of another, till they were crumbled into nothing. The brethren of the first separation had found fault with the Church of England for reading prayers and homilies as they lay in the book, and not admitting the presbytery to take place amongst them. But the brethren of the second separation take as much distaste against retaining all set forms of hymns and psalms, committing their conceptions, both in praying and prophecying, and singing of psalms, to the help of memory; and then subjoin this maxim, in which all agreed, that is to say, that there is the same reason of helps in all parts of spiritual worship. Upon which ground they charge it home on their fellow separatists,—that as in prayer the book is to be laid aside, by the confession of the ancient brethren of the separation, so it must also be in prophecying and singing of psalms; and therefore whether we pray, or sing, or prophecy, it is not to be from the book, but out of the heart. For prophecying, next they tell us, that the spirit is quenched two manner of ways, by memory as well as reading; and to make known how little use there is of memory in the act of prophecying or preaching, they tell us, that the citing of chapter and verse (as not being used by Christ and his Apostles in their sermons and writings) is a mark of Antichrist. And as for psalms, which make the third part of spiritual worship, they propose these queries: 1st, Whether in a psalm man must be tied to metre, and rhyme, and tune; and whether voluntary be not as necessary in tune and

words, as well as matter? And 2nd, Whether metre, rhyme, and tune, be not quenching the spirit? According to which resolution of the new separation, every man, when the congregation shall be met together, may first conceive his own matter in the act of praising, deliver it in prose or metre as he lists himself, and in the same instant chant out, in what tune soever, that which comes first into his head; which would be such a horrible confusion of tongues and voices, that hardly any howling or gnashing of teeth can be equal to it. Finally, as to forms of government, they declared thus:—that as they who live under the tyranny of the Pope and cardinals, worship the very beast itself; and they who live under the government of Archbishops, do worship the image of the beast; so they which willingly obey the reformed Presbytery of pastors, elders, and deacons, worship the shadow of that image. In this posture stood the brethren of the separation, anno. 1606, when Smith first published his book, 'Of the present differences between the Churches of the Separation;' but afterwards there arose another great dispute between Ainsworth and Broughton, whether the colours of Aaron's linen ephod were of blue or sea-water green; which did not only trouble all the dyers of Amsterdam, but draw their several followers into sides and factions."—HEYLYN'S *History of the Presbyterians*.

TO CORRESPONDENTS.

T. is blackballed this week. Our printer drives us much harder than formerly. The Shepherd was, all but correspondents' notices, made up before his letter arrived.

A Friend.—We are happy to hear of our doctrine being taught from the pulpit. The pulpit is the place for it, and it must cause considerable inquiry wherever it is thus presented in public. But any little deviations from it should be candidly overlooked, and forgiven. Neither should it ever be suspected that it is want of moral courage that prevents the preachers from speaking freely. It is a delicate point to judge of motives. Unitarians are more rational and philosophical in their doctrine, but they want the glowing warmth and religious feeling of the Trinitarians. Were Unitarianism to maintain the divinity of the whole Church, or mystical body of Christ, instead of denying the divinity of Jesus Christ, it would be both more reasonable, and more religious, at one and the same time. By denying the divinity of the man Christ, it has actually lost its religious feeling, and we believe it never can recover it, except by the adoption of the real "Catholic" doctrine of the divine authority of the Church, and its hypostatic union with God, as his representative on earth. There is no practical medium between this and out-and-out infidelity.

P.—If a man holds out a piece of bread to a beggar, and the beggar be suspicious that the bread is poisoned, can it appear singular that the beggar refuses to take it? Certainly not. Thus, although positive material good is demanded by the people, there is a necessity for convincing them that you have not poisoned the gift which you freely offer them. The Church will take from the Tories what it refuses from the Whigs; why, then, wonder if Christians refuse to accept even a positive good from infidels? We question if infidels would not be equally suspicious of even a liberal system of education from the clergy. These antipathies we cannot help at present; time, we suppose, will wear them away.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*
"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 24, VOL. III.]

SATURDAY, DECEMBER 9, 1837.

[PRICE 1½d.]

EVANGELICALS AND MORALISTS.

Most disappointed, in that crowd of men,
The man of subtle controversy stood;
The bigot theologian, in minute
Distinctions skilled, and doctrines unreduced
To practice; in debate, how loud! how long!
How dexterous!—in Christian love how cold!
His vain conceits were orthodox alone.
He died, and when he opened his ear, prepared
To hear, beyond the grave, the minstrelay
Of bliss—he heard, a/s! the wail of woe.
He proved all creeds false but his own, and found
At last his own most false; most false, because
He spent his time to prove all others so.
O love-destroying, cursed bigotry!
Cursed in Heaven, but cursed more in hell!

Pollok's Course of Time, B. B.

ALTHOUGH religious sects are innumerable, every individual being himself a sect, there is a grand generic distinction, which has prevailed in all ages, and separates alike the Catholic and the Protestant communions. It is the distinction which classes the members of the Church with the two great categories of Evangelical and moderates. There is more importance in this distinction than our liberal moralists of modern times are aware of.

The Evangelical denies the virtue of moral preaching—denies the possibility of making Christians of men, by teaching a formal morality. He hates a *moral* sermon. We have witnessed the fiercest hatred of moral discourses amongst the people. The preaching up of dead works, as they call them, is contrary to their received notions of Christian instruction. Many of them consider it tantamount to a rejection of Christianity. The moral preacher is esteemed akin to an infidel; and by many regarded with equal abhorrence as if he were a declared Atheist. The celebrated John Newton says he might as well preach to horses and cattle, as preach to men and women in a *moral* strain.

This may sound strange to many of the modern liberal school, who regard morals as the *all and in all*. But Newton knew what he was saying; he knew how to speak to the heart. His Cardiphonia, or "Words to the Heart," are the most eloquent appeals to the human feelings that the literature of England can produce; and we have no doubt that his preaching was equally attractive. George Whitfield was of the same school. He also was an Antinomian, a heart preacher, a despiser of forms. He was also an electrifying preacher. Inspiration accompanied his words. But no particular good was the result.

It is this inefficiency, in practical good, of the evangelical style of preaching, which forms the most solid objection against it. Its eloquence and inspiration no one can dispute—but it is essentially passive. Hence the party which belongs to it has always been remarkable for want of skill in the management of secular business. The moderate party are the Tories of the Church; the men of action, of prudence, discretion, and form.

They walk by rule and precedent, seldom stumble on one another, support sovereign and dictatorial power, are averse to all changes, and encourage the people to observe a similar formality in their moral conduct; always preferring precept to mere impulse, and the lessons of traditional experience to the theories of well meaning but oft deluded enthusiasm.

This latter party is a very unpopular party. It is the literary soul of the Church. The very best men, for learning and talent, with very few exceptions, belong to it. It is the champion of the faith. It fights all those battles which require learning, and vigour of mind; and is the principal defence of the Church from the weapons of infidelity. The Evangelical party is less qualified for methodical conflict with the enemy. It has less of the refinement of art, less of the learning of the schools, but more of the common feelings of the people. It tends to fanaticism. The fanatics all lean to this side. Fanaticism is merely a carrying out of the fundamental principle of the evangelical system, viz., a preference of the heart to the intellect.

The fundamental principles of the Evangelical school we ourselves hold, i. e., we prefer the affections to the intellect, and we consider the moralizing system of preaching as perfectly incompetent to reform society, or regenerate mankind. Nay, we consider it as positively injurious, in many respects; more especially as it preserves the false and unchristian belief that the present arrangements and inequalities of society are necessary, to afford scope for the exercise of the social virtues, and that the poor are made poor, in order that the rich may have an opportunity of being generous. But we consider the Evangelicals as utterly incompetent to moralize or Christianize mankind, merely because it is not a part of their creed or their system to make use of outward forms to create good morals—they address the inner man only; and while they are polishing and ornamenting the soul, their enemies are creating such outward arrangements, and such poverty of circumstance, as speedily render all their polishing vain, and hurry the poor simpleton, who yields to their allurements, either into apostasy or temporal privations. Moreover, whilst they are preparing one generation, and urging it to defy the temptations that surround it, another generation is growing up amid the same, or even worse temptations, so that there is no end of their labour; the same everlasting appealing to the feelings must be eternally kept up, for no attempt is made to remove the temptations, and an evangelized or regenerated father does not necessarily breed a son like himself. One would suppose, that the speediest mode of curing the evil would be to remove the temptations; but this forms no part of the evangelical plan, unless you consider Vice Societies and Magdalen Asylums as attempts of this kind, which we do not; for although they save individuals, they do not diminish the sum total of crime.*

* "The frequency of venereal complaints is much greater than the public imagines. It is a fact which cannot be disputed, that in large cities, there is not, perhaps, one in ten male individuals, from the age of twenty to thirty years, who has not been affected once or twice. I have been often shocked at seeing even boys and girls at the age of puberty, presenting them-

We say we prefer the evangelical basis—of appealing to the affections in preference to the intellect; but it is not by preaching that we would appeal. This *word-mongering* is a mere delusion. It is a paltering with the feelings of mankind. Affection cannot be permanently roused by words. It merely vibrates for a season, during the hearing of a discourse, but it dies in active life. Now it is in active life where we desire to have it; and as the preacher cannot follow his pupils into the busy scenes of trade and commerce, and preserve the same poetic generosity, and heavenliness of mind, which he can contrive to produce, for an hour or two, on a Sunday, we must have a substitute for this preacher; a substitute, too, who is stronger than the evil without; otherwise, the evil will reign over the man, and he will transgress the law of love. This the Evangelicals strive to obtain, with their regenerated nature. This regeneration of theirs, however, has had a long trial, and it has proved a failure. One generation after another keeps up the delusion, but the history of man, the history of the Church, has branded it for ever as a chimera. The evil without has always been too great for the new man within. Our plan, therefore, is to remove the evil without, and thus pacify the evil within. There is no other mode, we believe, of regenerating man, and this is done, not by preaching, like Evangelicals, by rousing the feelings to the love of God, through Christ; not by preaching, like moralists, by exciting mankind to love one another in circumstances which create mutual antipathies; but it is done by removing the causes of antipathies, and making men love one another, without preaching, and without an effort. "After those days, saith the Lord, I will put my law in their inward parts, and write it in their hearts, and will be their God, and they shall be my people. And they shall teach no more every man his brother, saying, 'know the Lord,' &c. Preaching is useless, and writing is useless, as moralizing influences. We do not write to moralize; we know it is vain. We write to convince the intellect of the necessity of re-forming outward circumstances, to produce new moral feelings.

We have said that the fundamental principles of the Evangelical school is a preference of the affections to the intellect. This, however, is only true in a very vague sense, for there is a curious inconsistency to be observed in this evangelism. The Evangelicals are the most *doctrinal* of all preachers. 'Tis they, and they almost only, who confound the understandings, and puzzle the imaginations of their hearers with controversial discourses on Justification, Election, Reprobation, Predestination, and all the other mysteries of the Church. All these subjects, however, concentrate in the Absolutism of God, and the all-sufficiency of Christ, which are the only positive ideas which the Evangelical Preacher presents to his hearers; and love directed to Christ is the great and sole aim of his ministration. He infers, that if men truly love Christ, they will love one another. This is merely a truism, if he understood it right; for Christ is the Church universal; and if love to the Church universal is once begotten, there is no fear of individual love. But where is the Church Universal? Is it formed? The Evangelical preacher cannot show his Christ, and therefore his preaching is vain.

The Moralist actually aims at the same end by a different channel; he teaches moral duties, and thinks to overcome evil by convincing the intellect more than by animating the feelings. He, therefore, writes beautiful discourses—learned discourses—philosophical discourses. He preaches before judges and lawyers, and *savans*; and instead of addressing the people, he addresses the rulers of the people, and demonstrates the beauty and the propriety of keeping first those laws which legislators have enacted to protect the members of society; and, secondly, those laws of honour and moral feeling which religion, and the universal sense of mankind, have inculcated in all ages. The first of these laws the rich are not tempted to break; the

preacher, therefore, has thus far an easy task; he speaks to convert perfect men. The laws of honour are also equally influential with the rich. The very rakes of the nobility and aristocracy keep them instinctively, excepting, perhaps, some sexual and place-seeking laws, about which the preacher knows it would be vain to harangue them; and, therefore, he very cautiously slurs them all over in his general denunciation of "the lusts of the flesh, and the pride of life;" phrases of large import, and susceptible of many Jesuitical interpretations. As for the love of money, the root of all evil, the clergyman's own heart, and his wife and family, are pretty good securities against any extravagant denunciation of this sin; so that, after all, the moralist preaches merely to the soothing of the conscience of the respectable members of society, and those who really require his preaching never hear him, and he does not look after them. People in comfortable circumstances do not require a preacher, and the poor do not get one.

Nay, what is more, they have no need of one. According to Dr. Colquhoun, a late London magistrate, there are 20,000 individuals in London who do not know in the morning how they are to obtain their first meal. What is the use of preaching to these? Their first demand is a breakfast. The nearest evil is always the most appalling; and though the preachers do their utmost to prove that God is even nearer than a hungry belly, and that we may be in hell before we require another meal, still there are very few men so formed as to regard this in any other light than a hypothesis, whilst the hunger and its demands are undisputed facts. It takes a most vexatious waste of words, and energy of manner, to convince even some poor witless, nervous, unemployed fool, of the awful condition of an unregenerate soul. What a vocabulary of words it would require to convert these twenty thousand breakfastless outcasts, who are forbidden to beg, who cannot be apprenticed to a trade without a premium, and who are thus obliged to declare war against society, and like Wellingtons and Washingtons, in miniature, deceive and plunder the enemy by any means. *Non nefas hostem decipere*. There is no harm in deceiving an enemy. Even Wellington himself approves of this saying, and only a few days ago acknowledged that no man owed allegiance to a government that did not afford him protection. Now, all the protection a London thief gets is this, that the sheriff will hang any man who murders him. He may go into a workhouse if he pleases, and there vegetate for life; but it is doubtful whether this can be called protection or not. Add to these twenty thousand breakfastless wretches the thousands and tens of thousands of other plunderers, the three thousand receivers of stolen property, who live by purchasing the prey of the unfortunate victims of an unruly and unmethodical system of society—if system it can be called—and you will find that not only do the profligate not reap any advantage from preaching of any kind, but that it cannot by any possibility affect them, as they are supported by opposition to morals, and doomed, like the fallen angels, to the state in which they live. A rare example of peculiar gifts occasionally comes out of this hell of society, but his case is a wonder, and becomes a species of romance for the press.

We are, therefore, not at all astonished at the antipathy of the people to what is called moral preaching, which is very unpopular. It is rather a proof of the good sense of the people; and, although the Evangelical preaching is exceedingly defective, wildly fanatical and inefficient, there is a great practical truth at the base of it, which, we hope, ere long, will become more apparent to the public mind. We have more hope of this party than of the other; there is more sincerity in it. There is less of that worldly prudence, and caution, and mannerism, and form, which characterize the other party; but there is more real, vivid, earnest, devotion, and resolution, to sacrifice to internal conviction. It is, however, the widest and the clearest field for imposture. The simple-minded, the honest-hearted, are the legitimate prey of the wolves and the foxes. You may lay it down as a rule—an infallible rule—that wherever there is the largest collection of simple-hearted honest people, there also is the greatest assemblage of rogues.

This antipathy to moral preaching is, in our opinion, a very fortunate circumstance. It is so strong, that we think it quite as probable that the people will fall back into Roman Catholic-

selves with syphilis or gonorrhœa at the hospitals at which I attend. Here we daily observe every form of venereal infection, and the most frightful inroads upon health."—*Dr. Ryan's Philosophy of Marriage*, 1837.

So much for Christian morals! and vice societies! and evangelical preaching! and moralizing!

ism as into a taste for moral sermons. It is not in human nature to relish such admonitions; there is something within one which refutes every syllable as it is uttered, which presents obstacles of such variety and magnitude, and questions possibilities with such impatience and warmth of temper, that eloquence is lost, and imagination strives in vain to give interest to the subject. We seek and want something stronger than a sermon. We feel that there is something hindering the development of virtue which preaching cannot remove; that something has not yet been taught the people, but, for want of it, they adhere to that which presents an imperfect semblance, viz., the Evangelical doctrine, which works with the universal feelings, by concentrating the affections of the heart upon a unity and spreading out from that unity to the members thereof. That unity ought to be the united church, in which all love should be concentrated, and from which it should drop down upon individuals as attraction draws it. The Evangelicals have made it the Man Christ who is not to be found, or who merely exists, in idea, in their own minds. They are not far from the truth; but even that little distance renders all their preaching vain. Preaching is not the thing that is wanted, or it must be a preaching which endeavours to get rid of the necessity of preaching—a preaching which stimulates the public mind to organize the church upon a principle of affection, so that all the dry bones of society shall be fitly joined together in mutual dependence and fidelity; and there shall be no outcasts but those who voluntarily retire from competence, sobriety, and peace—a retirement almost impossible.

Notwithstanding what we have said above, we can hold no communion with either party. The Evangelicals would regard us as impious heretics; we regard them as wild rhapsodists, who create confusion in society, and are only of use in keeping down the moralists, and preventing them from securing the pillars of political tyranny, and ecclesiastical apostasy.

We are not preachers by word only, we wish to preach by deed; and should Providence prevent us from fulfilling our wish, we shall still have been an instrument in his hands of raising our voice against the delusion of preaching and suggesting an idea of truth to some minds, who may reproduce it in others, until it becomes strong enough to call to the people in a tone too loud and too convincing to be long despised.

THE TRANSCENDENTALIST'S DIALOGUES.

No. XVIII.

ON TIME AND SPACE.

(Continued from p. 176.)

TRANSCENDENTALIST.—IDEALIST.

Trans.—Now let us take up the point where we last broke off. Let an activity A be impeded at a point B.

Ideal.—I am now convinced, that an activity must be impeded, otherwise it is nothing (*vide* last Dialogue), therefore say out boldly,—an activity A is impeded at the point B; of course leaving it open, whether A impedes itself, or is impeded by a foreign power.

Trans.—We came to the conclusion, that the activity was both finite and infinite.

Ideal.—We did, though I at first objected to the contradiction.

Trans.—Now we must try to reconcile this contradiction. It is evident, the activity cannot be absolutely infinite, or it would not be impeded; nor absolutely finite, or it would not be checked by the impediment, but by itself. We must try to find a middle course. Now, why did we say the activity was infinite?

Ideal.—Because it passed the impediment, and we assumed there was no other.*

Trans.—And why did we say it passed the impediment?

Ideal.—Because an activity which would stop exactly at the point would not be impeded by any thing at that point; in fact, the point would for it be nothing.

* This dialogue will be utterly unintelligible to those who have not read the last.—T.

Trans.—And yet, at the same time, it does not pass the point, or it would not be stopped there. We have to reconcile the contradictions, "passing," and "non passing."

Ideal.—True.

Trans.—Probably we have been too rash in thinking that there is no medium between "passing" and "non-passing;" and it is possible there may be one, in the same manner as motion was the medium between potentiality and actuality.

Ideal.—We will examine this. In the symbol of the brick and the marble we made motion the symbol of this activity: let us return to the consideration of that symbol.

The marble A is shot off from X, in the direction C, but is stopped by the brick B. The diagram represents the marble in the very act of receiving the repulse, and before any rebounding could take place. It gives the intrusive brick a smart rap.

Trans.—True, and in this rap the whole mystery lies. In this rap is involved the contradiction of passing and non-passing. Did the marble absolutely not pass, but stop at the point Y, there would be no rap. Did it absolutely pass, there would be no rap, for there would be no impediment to cause it.

Ideal.—I see that. If there were nothing at B, the ball A would be merely in motion, or in a middle state between a power of being at C, and an actually being there. Now the brick creates a curious position. The motion towards C not only seems to involve a power of being there, but that power is manifested in act, i. e., the ball has more than a mere power. But, at the same time, it cannot be there, as there is an insuperable impediment, therefore it has less than a power of being there. How odd is this: the ball seems to have no power, and at the same time a power which is manifested in act.

Trans.—We will take a better symbol; the one we are now considering supposes that in a moment, whatever power the ball possesses will be destroyed in a few seconds. Instead of a marble running horizontally against a brick, let us put the brick on the ground, and drop a heavy ball from a height. The moment of percussion may be represented thus:—

Here the power of the ball to arrive at C is never utterly conquered, but is manifested by weight, or a downward pressure.

Ideal.—I see the improvement made; the curious position of A remains longer, whereas, in the other we had a mere shock, and all was over. A is perpetually striving against B. Aye, that's the word, *STRIVING*! Striving is an exhibition of all sorts of contradictions. Power brought into act and impotence. Activity and passivity all are at once brought to view by this one position a striving. The ball emerges towards C, though it has no power of being there, not only towards Y but towards C, I say. The power is never conquered, and never conquers, it remains in act, and still manifests itself by weight.

Trans.—And we have shown that activity without an obstacle is nothing: hence we come to the following results:—

1. Power is manifested by activity. Activity is only mani

fested by an obstacle. Therefore, power, to be manifested, must be impeded in its operation.

II. Power must emerge beyond the impediment, or it will not only cease to be manifested, but cease to be altogether.

III. Power must not overcome impediment, or it will again cease to be manifested, *v. Result I.*

IV. Striving is the only manifestation either of power or impediment, of activity or passivity. If striving were taken away, nothing would remain.

V. Hence, absolute power and absolute activity, are, as far as we have seen hitherto, mere abstractions, as is likewise irresistible impediment. They are merely the component parts of a striving named separately, though in that separate form, it seems absolutely impossible that they should be manifest. "Strife," said Heraclitus, "is the parent of all things." I continue the title "Time and Space." They will be seen in our next.

HUMAN REGENERATION.

It seems that after these thousands of years talking and writing, as well as some substantial endeavour, the old subject has yet to be talked of and written about; the old business is still the new business. Human redemption, the first proposition, remains to be the final consummation.

All the space and time between the proposition and the consummation, are occupied by trials and failures, position and opposition, movement and counter-movement, advance of evil, amendment by good, progress to better, relapse into bad.

The *Shepherd*, too, perceives that dissertations on education, and even the very act thereof, are nought or naughty. He knows that such works are like filling the atmosphere with clouds of sand. His eyes are clear from every dust, no obscurities float about his mind. The tests he has for man's moral being are past all doubt—at least to himself. He would, at all events, be sadly deficient in sincerity if he did not think so; and candour demands that he should say what he thinks. He, however, confesses to have no objection to be the showman of an arena, where the public may come and have their optics well sanded.*

But, while it must be denied that true moral and intellectual education would increase conscientious crime, it may be agreed that something is wanting besides all that has been done; nay, even besides what has yet been proposed or imagined by the public mind.

What, then, is it that man requires besides education, and morality, and religion? It seems, he not only requires something beyond what these have given him, for that fact is now pretty well perceived by all thinking men, but it farther appears that some thinkers, among whom is to be ranked the *Shepherd*, begin to perceive that all the good which these means *promise*, when most thoroughly and beautifully accomplished, even up to the highest *beau idéal* of perfection, will leave man as far as ever from the one desirable result.

Very good. As children cry for toys one minute, which in the next minute they break up and scatter about on the ground, so mankind must call for political, for social, for moral, for religious reforms. Each, in due succession, he will obtain. Each in turn he will try, and by trial find out to be an empty bubble, the mere toy of a childish momentary desire—still hoping for relief in the next experiment, he goes on discovering the nothingness of every toy he tries.

It is not, however, by an indulgence in toys that the boy grows out of them. It is he himself becomes altered in his being, that he no longer affects them; and not because he is totally sickened of the childish nature by childish indulgence. Some *new nature* has been added to his former nature, larger and deeper than the first, which swallows up all its notions as knowledge absorbs belief.

We need not wait, therefore, for parliamentary reform to be succeeded by universal suffrage, and that by a total annihilation of a law-established church, and that by a reform of voluntary religion, and that by the general diffusion of scientific knowledge, and that by an expulsion of chicane from commercial

dealing, and that by the foundation of co-operative societies, and those by the establishment of an universal church; taking in all parties in its wide-embracing spirit, and allowing to each party its peculiar formulas.

No! as it is by a real addition to his being, that the child is brought into a state to forget his toys, it must be by an actual addition to his being that the man will forget his puerilities. All the attempts to sicken us, as the vulgar word is, do not, cannot succeed. We, thereby, become only pampered, overgrown babies. I therefore join you, in saying that no systems of education, of morality, or of religion will ever amount, under their most sublime aspect, to a supply of the grand human want.

In fact, those things are only means. And let me ask, how can means reach the end? They can only impinge, not enter into. We want something that is more than means, even if our objective end be all along the true one. You seem to say we are somewhat comparable to the gardeners who plant apple-trees and hope for oranges; and if you do not say so, I do.

The monarch of experimental philosophy, Lord Bacon, says we must not expect new results, except by means not hitherto tried. The interior experimentalist must carry this idea a step further. A new species of existence can only be expected from a new order of being; if it be of a higher nature, will necessarily come a re-form, a re-generation, a re-demption of the old nature.

Now, the views which the politician, the moralist, and the religionist, severally take of the subject ascend no higher than this idea expressed by the syllable "re," meaning something done over again with the old materials. But, as in familiar discourse, we should say the house was re-built, whether when the old one was pulled down, and the same materials were used to erect the new one, or if entirely new materials were used; so on the higher subject we have not been in a state of mind to have brought into use too suitable words to express this important difference.

I am ready to grant the necessity of this renewal; but, like the renewed form of the house, which could be obtained with new materials as well as with old, while in the former case something more is done besides obtaining a new form. So, when man admits that Nature, that order of being, to be super-added to his present nature and being, which is essential to the attainment of the end, he, at the same time, undergoes a re-generation in his religious nature; he experiences a re-demption of his moral nature, and he manifests a reformation in his social and political sphere. Those three are necessarily the offspring of the primary and essential vitality; but the three may be in a manner exteriorly attained by the sublimest ideas of education, morality, and religion, without ever, in the slightest degree, approximating to THE ONE.

Nay, it is generally the fact, and must be so from the known laws of human nature, that the greater and greater refinement by education, morality and religion, on the outside, will more and more keep the individual from acknowledging and relying on the vitality or source of originality, which must lay hold of, and be added conscientiously to his being.

The reader will then want to know to what science, to what class of teachers, he is to look for assistance. Neither scientific nor political, nor moral, nor religious instruction, is allowed to offer any hopes for mankind. To what, or to whom, then, is man to apply? Cast off the schoolmaster, the writer, the lecturer, the priest, and all are gone!

Not so fast, Mr. Reasoner, there is another teacher approachable, perhaps, by two modes—direct and indirect; and, therefore, as good as two yet untried opportunities.

But how I shall best advertise you of this fact, or rather of these facts, requires some further consideration. If neither forcibly written doctrine, nor eloquently delivered lectures, nor highly intellectual schooling, nor actual moral example, can master the difficulties which they set forth to conquer even on ground universally understood and admitted, what can I hope to do for a new mode on a new ground, neither allowed nor appreciated, while I have at command only the lowest and coldest of all human mental means—letters?

* See *Shepherd*, No. 21, present volume.

[We recognise our friend under the name of "MYSTIC," and are glad we have roused him to write as he has done. We ourselves feel always the better for a dig of the spur, and a mystic is not unlike us in this respect. Now, we think, we can bring him to the point. This letter is more intelligible. Every reader will perceive that "A Mystic" wants, *first*, to renew the nature of man, and, *second*, to renew the forms of society. We prefer the opposite principle, *first*, to renew the forms of society, and, *second*, to renew the nature of its members. But how, says "A Mystic" can an immoral nature moralize society? The moral nature is not the *mechanical* nature. Men do not make chairs and tables by their *moral natures*, but by their intellects. It is the intellect that reforms society outwardly, and this outward machinery reacts upon the moral nature, and produces what we want. He very nicely caricatures our process of reform. How very easily we could caricature his! But we refrain at present. This week's leading article was written the evening before we read his letter; it touches upon the subject. We beg to assure him of the highest respect, and to say that the allusions to which he refers, were made with the intention of stimulating to a more spirited discussion of the important point; and we shall be happy to print even the most bitter satire upon ourselves, and renounce our opinion when convinced.]

TWO LETTERS FROM A MILLENNARIAN.

THE two following letters were sent by an unknown reader, who has corresponded with us for several months, but whose letters have never heretofore been inserted in the *Shepherd*. He is evidently a Millenarian, and regards the Scriptures as the standard authority. His letters were not written for publication. We requested permission to insert them, as his correspondence with us has been gentle and honourable, though decidedly, and we doubt not, conscientiously, opposed to us. The principal point of controversy, at present, between us, is authority. Our correspondent regards the Scriptures as authority: we reply, the Scriptures require an interpreter; the interpreter, therefore, is greater than the thing interpreted, inasmuch as he is the final court of appeal. When the law is plain and intelligible, it is above the judge; but when it is doubtful, the judge is above the law. We complained, therefore, of a confusion of authority in his doctrine, inasmuch as he made an exceedingly ambiguous book, full of metaphor, and fruitful of controversy, the final court of appeal. We take the ultra-Catholic view of the subject, and regard the Church universal, that is, the people, as the infallible judge. This controversy arose out of a prospectus of a religious association, sent us by our correspondent. This, we think, is sufficient to enable the reader to comprehend the meaning of the two letters. But should he wish to comprehend them better, he may refer to our answers to I. G., or to W. B., in our notices to correspondents:—

TO THE EDITOR OF THE SHEPHERD.

(1.)

MR. EDITOR,

It gratifies me to find that the paper which I sent to you is so far comprehensible as to form the basis of the article to I. G. or W. B. in your answers to correspondents. That article is sufficiently definite to satisfy me that my views cannot be very greatly misconceived by any one of competent understanding. I have now to apply myself to parts of your remarks.

First, as to the "confusion of authority," your objection appears to me to suggest a distinction without a difference. Two things which are (as I conclude) dependant on each other, may safely be referred to in the manner I have done. The *spirit* in the church is not (as yet) manifested in such plenary independence as to be separable from a reference, or deferring to the written word,—*"If they speak not according to this word there is no light in them."* You argue, apparently, for the "light within," as the Quakers do, and thus undervalue the

"Law and the Testimony," a common—a *necessary* aberration—into which all fall, who have not a perception of the *resurrection form of Church-state polity of the body of Christ*. I use the word *resurrection* here as implying conformity of spirit and life to the revealed will of God, whilst the individuals are yet in flesh and blood in this world. I use the word "body of Christ," as applicable to the, or this, visible church. I have no notion of the perfectibility, or infallibility, of the church being accomplished, until that period arrives which is referred to in 1 Cor. xv. 24; then, no doubt, the church will not be dependent upon printed books. We do not, indeed, "yet know what we shall be;" but, this we know, "that when we see Him, we shall be like him, for we shall see Him as He is."

2d. *With respect to what you term the consecration of Scripture by the Church.*

If any person can produce a manuscript, or book, or books, having equal claims to inspiration, with those which now are recognized as the Scriptures of the Old and New Testament, the church (although I do not know what you quite intended by the word) would be guilty of indifference to truth, if it did not humbly and prayerfully inquire into the authenticity of any such documents; and it would be quite consistent to receive any such document into the canon of Scripture, on the approval of the validity of the writing. The church would "declare" whether it believed the book to be of Divine authority, and in the degree in which the visible church was free from carnality of mind and life, would its decision be correct. It could as well detect spurious *writing*, as spurious *verbalism*. The language which you use in reference to this part of our subject, partakes, to me, of a somewhat painful, if not profane, levity or dogmatism.

3d. You speak of *making (new) Scripture of equal authority with the Old and New Testament*. This is a term I dare not use. I read, "Holy men of God spake as they were moved by the 'Holy Ghost;' and the Apocalypse says, in reference to that particular book, "If any man add to the sayings of this book, 'God shall add unto him the plagues that are therein,' &c. &c."

Again—What do you intend me to understand by the Church, whose history you put upon a level with the history of the Jewish Church. My belief is, that the history of the *Church of God*, from the first advent to the end of all things, is *ALREADY WRITTEN* in the prophetic and other Scriptures of the New Testament, and of the Old Testament also; *for these have not yet received their perfection of accomplishment*. The course of events will only serve to prove how well defined and ample is *Prophetic History*. The *Scriptures*, as now written, will yet supersede all Church Histories by whomsoever written. The church is not yet sufficiently humbled into visible and mental unity to be allowed to eat of that fruit which is reserved for the age of repentance towards God, and of Faith in our Lord Jesus Christ. (See the last paragraph of the Answers to Correspondents, p. 46, No. 6, v. 3.) The Plenary inspiration of the church seems reserved for that age "when the tabernacle of 'God shall be with men,' (see Apo.), or when mortality shall be swallowed up of life."

What is your own definition of the Church, as used in your answer to W. B.?

As to your second objection.

"Plan of association not sufficiently defined." "Depend upon it, nothing but the clearest and most arithmetical mode of going to work can succeed in these *scientific* times."

I am at friendly issue with you as to almost this entire paragraph.

It is not known to me what is a suitable *plan*, although I am not wholly without ideas on the subject; but, I should hold at *arms' length* any plan of organization which was not the result of information obtained, *after the visible unity of the Church*, under the *supremacy of Holy Writ*. My authority for this is the analogy of redeeming Providence. (Exodus, viii. 1-8., latter part 26th v.) The law was given *after* the Exodus. The church is not yet in the position of obedience which may entitle it to look for divine guidance. It has not yet obeyed that *letter of Scripture* through or by which, in these last days, it will be judged and ruled: But as to organization, surely, sure-

ly, Christians know what is civilized and social, as well as Owen, or other men of no better pretensions, though of more scientific acquirement. We want, *first*, not science, but sincerity; not knowledge, but loving obedience. All the sciences will find their due place when faith in God and His Church shall have brought the church into the position of *primary unity and obedience* to which we have referred. We may not look for knowledge of the form or beauty of the future tabernacle or temple (formed of living stones), until we have, as a people, come out a second time from Egypt (Christendom), as the Israel of God.

In reference to "A Plan," let me say, in addition, we, as Christians, have *no plan at present*, as I have before said, for these reasons.—*Acts*, ii. 39–47; iv. 33–33.

Nov. 7th, 1837.

I. G.

(2.)

I. G. thinks that the reply to his letter is, in effect, no reply at all; the letter is untouched. I. G. never argued for the supremacy (*absolutely*) of the letter of the book, but he did, and does argue, that the manifestation of the pure spirit of God is always in honour and confirmation of the book, and, as by a reference to this book, the "dead" are to be known from the "living," it is essential, until the consummation of all things, that reference should always be had to the "Law and to the testimony." We agree with the *Shepherd*, that this reference is frequently very sectarianly made; but there is the "cant" of false liberalism, and false philosophy, as well as other cant; and where men "beat off" from the written word, we have seen that scientific folly has become as bad a guide as ignorant superstition. The French revolution of 1789 is a fine proof.

We deny that the living spirit of the Church puts a meaning "upon, or into the book." The book had the meaning before the spirit of I. E. S. or I. G. had a being. It is well if they have eyes to see the book's meaning. This distinction I. E. S. seems to have entirely lost sight of. His "spirit of infallibility" of what he calls the Church, is as spurious an infallibility as that of the Papists. I. E. S. has not defined his Church even yet, unless it be "all believers of all churches of all faiths throughout the world," and this is a very liberal description indeed; one, however, which I. G., with certain limitation, could adopt.

We had provided calculations for a difference of spirit. We know it exists, but we aver that that difference is the result of acting on the independent plan of I. E. S. How can men agree, unless they meet in humility under the supremacy of God, and his promise to enlighten us with his written word? How can the Bishop of Rome, and the Archbishop of England, be expected to agree, whilst both avowedly or virtually hold aloof from the divinely appointed test? If I. E. S. did not write as he does in other respects, I. G. would take him for a Romanist Jesuit.

I. E. S. speaks of the "Church collective;" What does he intend? How is *their judgment obtained*? the which, he says, is to be "always right." This is the "sovereignty of the people," indeed, and is a delusion—the delusion in which thousands are involved. It is the resource of Deism, or the breaking up of absolutism, but it is not the truth. I. E. S. apparently avoids a reference to Scripture, or else he would see, that the "always right" judgment of the Church, or people, is sometimes, and very frequently wrong. It may be in harmony (too fearful harmony) with the "condition of the mind of society" of a particular age or time, but even the holy tribes may go up to battle without divine sanction, and thus bring (foreseen) judgment upon themselves.—*Deut.* i. 41. This act was done in self-willed disobedience to the appointed means.

We know that God will not dishonour the rational being, or the gifts which he has given to the sons of men; but to contend that all gifts, and all privileges, are equal, is as illogical as to say that all our faculties are equally to be honoured. We hold that our head is not our feet, although the one is the true provider for the other. The *Shepherd's* universalism is, we fear, without a fulcrum—without a *satisfaction*. It is the unstable will of creaturely fallen man. We have already said, that we

anticipate a result as glorious as that prepared by I. E. S.; but as Irving* well said, "we may confound the *age of imputed* righteousness with the age of *inherent* righteousness."

It remains—"at the name, dignity, authority, inspiration, will, wisdom, of Jesus, every knee shall bow."—"To the glory of God the Father." He who will not *thus* receive the Son, until the fulness of all things, dishonour, as we fear, our Lord Christ, and injures his own soul.

I. E. S. has not answered I. G.'s last; but controversy seems in vain, and J. G. will trouble I. E. S. no longer.
Nov. 17, 1837.

* I do not concur in the whole of the paragraph from Irving, p. 548, of "Church and State responsible," &c.

A SALVE FOR LAST WEEK'S SORE.

PRINCE HOHENLOE.

LAST week we gave a favourable view of the subject of Prince Hohenloe's miracles. We now consider it nothing more than just, that we should give a specimen of the reasoning of the opposite side. We, therefore, give the following extract from the most able discourse upon the subject which we ever perused. It is a discourse of great ability and learning, with notes, peculiarly rich in quotation and anecdote, all bearing pointedly on the subject of discussion, by the Rev. C. Otway, curate of Lucan:—(Dublin, 1823. published by R. M. Tims.)

"Valentine Greatrakes, a Protestant, in the county of Waterford, thus took the enthusiastic idea into his head, that he had a power given him to cure diseases, and whenever he could find a fit patient to work on as excitable as himself to the efficacy of imagination, he cured them simply by drawing his hand gently over the part affected. In this way, he performed extraordinary cures on some, and altogether failed, as Prince Hohenloe has done, with others. In one sense, indeed, he was superior, for it is well attested that he completely effected the cure and restoration to soundness of health of many. Whereas a German physician, resident at the town where Prince Hohenloe lives, publicly *declares and asserts* (for his book is now published in this city) that Prince Hohenloe never yet performed a perfect cure.* And, indeed, as far as his miracles go, which have been performed in Ireland, they corroborate the assertion of the German doctor. Are these perfect cures? are any made whole? can they walk and leap, and go about the streets praising God, like the cripple that Peter and John cured? I challenge the Romish Priests to produce the three young ladies who, as they say, are miraculously cured; and if these young ladies walk, without stopping to take breath, from White Tavern-street up to High-street, at a pace as fast as a young person in health can do, then I will allow they are perfect cures. But when Mrs. Stewart of Ranelagh convent, has an issue open, when she looks as pale as a corpse, when she totters into a room and seems to rise to receive the salutations of her visitors with extreme difficulty and weakness; when her pulse, after she was miraculously cured, was beating at a rate higher than that of a man in a fever, when an excuse is made for her, that she cannot even walk in the garden; is it not a monstrous mockery of God, to say that he who does nothing imperfectly,† should, in this instance, exhibit an imperfect miracle?"

* Here, it may be asked, is it not as easy to procure a German physician to deny a truth, as an English physician to affirm a lie? These disputes expose poor human nature in a most piteous light, its eyes blinded by religion only, or rather by sectarianism or irreligion. Without this sectarianism there would be neither imposture nor the suspicion of it, and this party zeal about the demonstration of facts and the exposure of errors would be unknown. It tempts one to cast off human testimony altogether, but Prudence condemns this act of passion.—E. S.

† What does Mr. Otway mean by this? Did he never see an imperfect man, or dog, or cat, or flower? It would be very easy to show that in a *beau ideal* sense, all God's works are imperfect, and that, therefore, cures ought to be effected upon

"But I am sorry to have to observe that here are such evident marks of *getting up* such strong circumstantial evidence of imposture, that I am certain if such details came before any twelve Jurymen, on their oath, in the matter of proving a will, or any other such wordly matter, they must find a verdict of conspiracy to defraud. How comes it that of the many persons who sought for cure through the power of Prince Hohenloe, Protestant physicians were brought to none, but those few whose miraculous restoration has been since asserted? The Doctors, Mills and Cheyne, were called on the 31st of July to see Mrs. Stewart. This lady, before that day, had sundry issues; it was a great matter to show to those physicians that those issues were still open; for the miraculous cure was to be effected on the following day, when issues were to be no more necessary, but they were never shown those issues. It was a great object to have those Doctors declare "there was no hope;" in the usual phrase it was desirable that she should be "given over;" but when it was put to Doctor Mills (and this I have from the best possible authority) whether the lady was not dying? the answer of the Doctor was "No, I cannot say, for her pulse still promises well;" and he immediately sat down and wrote a receipt, which directly proves, he had not given her over. Besides, I am assured when the Protestant physician examined her limbs on the 31st of July, they were quite flexible, and there seemed to be no positive reason why she might not rise and walk. In fact, the religious lady was hypochondriac, and in a state of great nervous weakness, a state from which she might be raised by the irritability of great nervous excitement.

"As I cannot now occupy your time farther on this subject, I take leave to recommend to your notice, three able publications on this subject, in which the writers take three very different views of this most interesting subject. One gentleman in a letter to Dr. Doyle, allows, I think too much, where he is willing to consider these cures as miraculous; but from the concession, he most ably and scripturally argues that the Romish Church is the Church of Antichrist; because she claims as her property signs and wonders, and no self-called Christian Church, but the Church of Rome has departed from the truth, in arrogating to herself signs and wonders; therefore she is Antichrist. Another writer in a pamphlet called "Miracles Mooted," asserts it is all imposture, and takes strong grounds and brings powerful proof to his assertion; and another, in an essay on the influence of the imagination and passion, and on the production and cure of diseases, shows, in my opinion, decidedly, that these wonders under our consideration are explainable, by the great effects which a concentration of passions can perform when called into action by religious enthusiasm; all those distinct views may be true, and all may be united in accounting for Romish miracles. You are to reflect, that the performances of Antichrist are called lying wonders; lying because they are impostures in themselves, and because they are put forth to serve a lying doctrine, and promoting a strong delusion to believe a lie; and Satan may be permitted to combine the cheats of impostors, and thick coming fancies of imagination, to work his ends. He may enlist some knaves and fools in his cause, in order to build up the great mystery of iniquity."

So much for Mr. Otway. It is evident he is at a loss what to think. He admits a wonder but denies a miracle, suspects imposture and is suspicious of the nerves; has a firm faith in Satan's attachment to popery, and no doubt of the primitive purity of the Church of England. And what is to settle all this controversy? Look at Protestant morals! what are they to boast of? Look at the 70,000 harlots of London, and their 200,000 paramours, and what have you left? With such Christians the Apostle forbids us to eat!!

this invariable principle of imperfection, which belongs to this planetary state of being. It is only by hypothesis that it is asserted that the miracles of Christ and his Apostles were perfect.—E. S.

* Not prompted!! he is a first cause!—E. S.

OUR TWO OPPONENTS.

This week we have two opponents upon us. Our friend the Mystic on one side, and I. G. on the other. The one has his Scripture within him, and the other without him, and they are equally opposed to each other as to us. What our friend the Mystic's court of appeal is we cannot well define; but we suspect that neither he nor I. G. will find any other practicable court of appeal than the universal people, unless they subject themselves to hereditary dictation, or individual caprice. No doubt it may be replied, that if each man have the spirit of God to guide him, all will go on well. This "if" is very convenient in argument; but we never saw this spirit of God in real life, and believe we never shall, either in this world or that which is to come.—Without leaving doubts, it would make men irrational. It is doubt and difficulty that makes man reason. Were there no doubts he would be instinctive, and act like bees and ants. This is not man's nature. Man takes and gives counsel, and he fulfils the highest law of his being in regulating society by the spirit within him, i. e., the combined spirit of his species. Our correspondent, I. G., hints at the fallibility of the public mind; and our friend, the Mystic, talks of the failure of all external modes of moralizing mankind; but both parties use language without a meaning to us. We deny that the public mind has ever been known or consulted in any age or country. But, even supposing it has been known, consulted, and obeyed, we say the result was right, whether it produced good or evil; for, if the majority of the people are wrong in opinion, the sooner they are convinced of their error by experience the better. In this respect, therefore, they are infallible, whether they be right or wrong. If the want of experience has kept up a delusion in the public mind for centuries, and five years' experience would remove it, would it not be better to commit a five years' blunder than keep society in agitation for five hundred years? But we have already declared our opinion, that it is only in the moral department of government that the people become infallible. In political economy they are fools, and will ever be fools. The only good use the people could make of power would be to remove taxation, and this they will do ultimately but slowly; and, in doing it, they will suffer great misery, and commit many blunders, which will be useful experience to them, and will teach them ultimately to annihilate taxation altogether. Then there will be no political economy and no blundering, for rent will be the revenue. Every temptation to crime must be removed, and those of customs and excise are universal. Thousands and tens of thousands live by cheating government, and government keeps men in pay to prevent those impositions. Can this always be? and what is the use of it? The people hate these things with a mortal hatred. That unerring power that made man, has directed the popular antipathy against that very source of crime, and the hatred will work the abolition of the system.

Perhaps "A Mystic" would prefer making men moral by a peculiar process of education, and thus teaching them to keep all these laws, and thus save the government the expense of soldiers and police. But even supposing, by an awful effort, and the employment of a million of teachers, men could be moralized upon the present system without the idea of a better, one single apostate would be sufficient to corrupt the whole nation, and throw it back into confusion. Suppose all traders honest to-day, prices all fair, wages all fair, confidence restored. One man resolves to take advantage of this; he obtains credit, undersells, smuggles, and cheats the government, forces competition, spoils the business of others, excites their fears, put their wits in operation to escape from the threatened evil of loss of custom. Trickery re-appears; the public is deceived, suspicion is revived, and in a few years, we are just where we were; morality and principle, and every thing else that's valuable, would be hurried away in the stream. Morality is an art—a game. It is by moves that you produce good or evil; and as the moves of the rich are too powerful for the poor, the poor are thrust by necessity into nooks and corners, and forced to deceive or spring upon their pursuers. If you want to moralize mankind without changing the form of society, you must teach resignation and submission to the poor, teach them to be content with potatoes

and sour bread, and cold water and straw beds, and the minimum of subsistence. Once produce this pusillanimity, and you will soon find them down at the very lowest abyss of sufferable misery. But if, on the contrary, you rouse them to activity, to a determined resolution not to be imposed upon whilst there is good bread, and enough for all. If you raise their standard of living, and give them high ideas of domestic comfort, by multiplying their wants, you necessarily improve their condition by dragging them farther away from the verge of misery. If you also cultivate their moral and social tastes, by alluring the imagination by works of art, and encouraging emulation in the productions of fancy, if you give them public halls in which to meet and converse, lecture-rooms to hear instruction, or pure dramatic representations to please and to instruct at once, you need be under no apprehension from public houses and gin-shops, whose sole attraction arises from the circumstances of their being the only places of resort that are provided where social conversation can be enjoyed at a small expense. Some, we know, maintain that human wants should be reduced to the very lowest possible amount, that man may thus be rendered independent of externals. This is a horrid doctrine; and we will not believe that these people deal fairly in teaching such a doctrine until they have emptied their houses, thrown out their carpets, their arm chairs, their sofas, and side-boards, and tables, and all the other et ceteras of unnecessary luxury which the poor have not, (which Diogenes did not want), and confine themselves within as small an apartment as life will admit of. If their principle be correct, there can be no use in stopping short of this; but we deny its correctness. Man is moralized by increasing his wants and his aversions; a cleanly man must have clean clothes; a dirty man can do without; a chaste man must have great propriety of language and behaviour; an unchaste man is not particular; a well-bred man must have certain forms and observances adhered to at table; an ill-bred man will do or say any thing—sup the gravy, tear the meat with his fingers, grease all his cheeks and his chin, and make mouths like a savage; he feels no offence, and suspects none. In this respect he is more independent of forms than the other; his wants are few; he follows impulse. The well-bred man has many wants, and these very wants constitute his good breeding.

All the three modes of improving the people, the intellectual, political, and moral, must proceed together: any attempt to carry on the one independent of the other, must be productive of great misery. It will cause a fearful reaction upon itself.

As for our friend, I. G., we suspect he takes a wrong view of religion and of Providence. His Holy Spirit is an imaginary principle, unless he reduces it to practice methodically. Experience does not prove that the Holy Ghost will act as our friend expects. The history of man refutes the supposition. The Holy Spirit, upon twenty men, has generally been found to have twenty minds. This is the beauty of it, in our eyes; for this law of God and of Nature will force mankind to social council at last. Some modern enthusiasts have got an idea, that a new mode of generation may be practised, and children born regenerate of regenerate parents. This plan only exists in theory; the parties, however, have no doubt of its truth. Experience would be a powerful argument; but where is the child? One man, two years ago, actually produced his regenerate child, and caused a stir in London among many people; but the bubble soon burst, and the child is now regarded as included in Adam's transgression, with our common imperfections. Of course, it can be easily shown, that this man was not himself regenerate, or his child would have been perfect—the theory, therefore, may still be true, and those who hold it may still be confident, but this notion is two thousand years old, and never has a regenerate child been yet born! As old also is this notion of the Holy Ghost's especial superintendence of a party by particular inspiration, independent of human skill; but this faith has always subdued reason, prevented the exercise of judgment, and thus occasioned the most fearful violations of prudence. It has thus made a mockery of religion, and caused people to turn the Holy Ghost into ridicule. Even the "Spirit" of the Quakers, who, being a kind of dumb spirit, is the meekest of all, is a standing joke in society,

and not without reason. The true Holy Ghost is the calm and deliberate influence acting on a well-informed and polished mind. We know of no better. If there be a better, he has withdrawn from the world; but we cannot imagine a better. A spirit of revelation would be worse—dreams and visions would be worse—miracles would only make conjurors of us, and could and would do no good to society, unless they did more than the Apostles did with theirs; for the miracles of the Apostles laid the foundation of Antichrist's kingdom. And pray what else but Antichrist have we found, when pious Christians eighteen hundred years after Christ, are deploring the state of the Church, and their own solitary condition in the wilderness of professional religion?

It may be asked, if the Church universal contain the true, and practical, and infallible spirit of God, how does it happen that the spirit of God is divided? That is the very characteristic of Christianity—"This is my body, which is broken for you." This breaking of the Church is Antichrist to the parts, and in the parts. It produces good ultimately, by conveying useful experience; but whilst it lasts, it is relatively (though not absolutely) a positive curse. But the fragments must all be gathered; not a crumb must be lost; every bone must be knit. The Church will all come together again; the people will push in upon the clergy; clerical power will fall, and ministerial service be substituted in its stead. Then you shall see the Holy Ghost, and "the Lord shall be king over all the earth. There shall be one Lord, and his name one." This is Scripture—this is reason. It is no chimera. And if we, in body, see it not, it is not the less certain in the womb of Providence. It is thus that faith will be consummated in knowledge on this terrestrial ball—but it will be a mere shadow of a heaven. A planet like this is not susceptible of such glory as the literal promises of the Jewish prophets imply, and very just that it should not be so. Man, we hope, is destined to rejoice on a larger and lovelier ball than this miserable moon-haunted prison. We regard it merely as an inn, a tub in which we sleep for a night, as we pass along the highway of eternity. We hope to see brighter scenes; to sleep, and wake in an eternal succession of beings; but whilst we are in the world, we must dabble in its affairs; and here we have given a few of our conceits, but with good feeling, whatever may be the appearance of our words and phrases.

CREOLES.—Humboldt has observed, that the offspring of a Negro and European is more robust and active than that of a White with an American, because the best mode of effacing hereditary diseases, gout, scrofula, phthisis, mania, epilepsy, &c., is by the commixture of the species in intermarriages, as this corrects the defects of one individual by the soundness of the constitution of another.—Dr. Ryan.

TO CORRESPONDENTS.

I. G. was too late in requesting us to withhold his letters, but his fears were ungrounded. We shall not enter into controversy, and his letters will be interesting to many of our readers. But if I. G. is desirous of doing good, or conscious of being in the truth, why be anxious to avoid controversy? The Apostles contended in the synagogues and market places. Had they not done so, we should now have been writing against augury, and the killing of beasts in sacrifice to the gods; they have saved us that trouble, but certainly left us something to do.

THE CHURCH.

But not till time has calm'd the ruffled breast,
Are these fond dreams of happiness confest;
Not till the rushing winds forget to rave,
Is Heaven's sweet smile reflected on the wave.

Rogers' Pleasures of Memory.

THE State must finally become a Church, and the Church a State, and this take place whenever the State becomes a moral, instead of a political, government.

This is tantamount to a separation of Church and State, and also to an incorporation of the State with the universal Church. The earth nourishes all her children. Nature gives life and encouragement to all sects and parties. These are models of the universal Church. No Church can be catholic, which does not admit of variety within its bosom.

It has been objected to the unity of the Roman Catholic Church, that there is division in it; but the division of the Roman Church is of a very different species from that of the Protestant. In the former, all the dissentients arrange themselves under one head, and abide by one communion, and all submit to the authority of one supreme Pontiff, or living authority. The Catholics of England are often disgusted with the mummeries of the Continent. So says Mr. Baines, a Catholic priest, of Bath, in his "Vindication of the Christian Religion for the last Thirteen Centuries." His language we cannot quote from memory, but such is his meaning. There is an accommodating spirit in Catholicism, which bends before the weakness and prejudices of different climes and countries, and thus actually becomes, in part, what it claims to be, "a Catholic religion." In part, we say, for this accommodation of the Roman Church is carried only a very little way. This little way is the cause of its destruction. Had the spirit of accommodation been greater, Luther never would have separated from the Catholic communion. Had the Court of Rome understood the nature of man, and the laws of mental progression, she would have yielded to the spirit of the times, and asserted the Divine right of changing the nature of the dispensation, the forms and the ceremonies, with the changes that occurred in the public mind. Luther would have been satisfied with this. This would have been a precedent for future times, and various other changes would have been accomplished, and the Church might have attained to its destined perfection without a rent. But this was not the process ordained.

Had this process taken place, it would, most probably, have retarded reform; because it would have strengthened the Church, which would have used its influence to prevent the establishment of the representative system, through which alone a union of all classes can be effected, and the genuine voice of society and of God be heard. The access to representation is much shorter by politics than by ecclesiastics. Protestantism opened up this path, and now we are striving, with all our might, to [enter the strait gate, and complete the unity of society, by a perfect representative system. We know of no legitimate authority for society, but the whole of society itself; and we

are on the road to this authority, before which every minor power must bend.

Protestantism has entirely destroyed the Church, both in Catholic and Protestant countries. The State is the only national unity. Every man feels interested in the movements of the State. A few only concern themselves about the affairs of the Church, except when it intermeddles with the rights of the majority. Moreover, the representative system does not exist in it. You must have "orders" to belong to it. Not so with the State. Every man may be a senator; every man may, by a little industry, become an elector. Every man, therefore, as soon as he begins to think, thinks of the political right which he may, in a few years, enjoy, and on the exercise of which the future welfare of the country partly depends.

There is no institution but the State, in which the people can be collected into a focus, and concentrate their moral and intellectual power. The machinery is partly prepared for them, and by a continued and unceasing effort, they will perfect that machinery more and more, till at last it is worked by the combined will of the universal people. This we call the birth of a universal Church. It must begin politically. It is vain for any man to attempt to stop the current of this movement. Such is evidently its tendency, and wise men will rather direct and urge it than endeavour to stop it—more especially when there is no other conceivable channel, in which a movement can take place to universality.

When this universality has taken place politically, one of its first effects may be to place all religions on a level, and let each find its own support by its own worth. This, however, will be a very imperfect and unsatisfactory measure; a measure which has already taken place in other countries, and of whose immediate consequences we can by no means speak favourably. There is not a more fanatical and illiberal people than the American Republicans, among whom this system of equalism prevails. If no better result shall follow than that which American experience has manifested, our posterity have little reason to exult in the prospect which political universalism holds out to them.

Lucky, however, it is for mankind, that America has displayed to the world a sample of political universalism. With territorial advantages, superior to those of every other country in the world, it is very questionable whether the United States be at present enjoying greater prosperity, either nationally or individually, than might have befallen them under the dominion of the parent country. But allowing every argument in favour of political universalism to be true; admitting, that had it not been for independence, universal suffrage, and cheap government, the Americans would have been just where they were, before the declaration of independence—we affirm, that the sum total of actual gain in happiness to individuals, and to States as collective bodies, is but as dust in the balance, and not worth the price that it cost. The people of this country are becoming alive to the truth of this fact; the experience of America has become experience for ourselves; and we doubt not, when the public voice has obtained an organ by which to give utterance to its thoughts, it will declare other doctrines

than those of American Republicanism; and steer a shorter and a safer course to national regeneration.

What that course may or should be, we do not mean to inquire at present; we are more inclined to reflect a little while on the prevailing prejudice amongst educated people against popular or moral government. It is, indeed, a living discourse on the Scripture texts—"the wisdom of this world is foolishness with God," and "to the poor the gospel is preached." If the gospel be preached to the poor, it must be in the poor. It has already been preached. God, himself, has preached it in their formation. He gives it to them by Nature. The gospel is theirs by inheritance, and the gospel is good news, and these good news they will tell when you give them a tongue. Has learning done any political or moral good for mankind? With all his knowledge, can the man of science settle the controversies of politics? We need not sneer at religious disputations, political mysticism is much deeper, and never can be disentangled but by one process. How can justice be administered to all, when taxes are laid upon all or many articles? If the taxes are equal in amount upon different articles, they are unjust; and no man can find out the proper proportion. Complaints, therefore, will be uttered loudly throughout society as long as two different kinds of taxes exist, and the wisdom of man will never be able to settle the dispute. Political knowledge, therefore, such as we have at present, is of very little use except to prolong discussion and puzzle opponents. Had men more knowledge, they would put an end to political government, and introduce moral government; for true knowledge can easily demonstrate that politics are, by necessity, a labyrinth, and no balance can settle their controversies in equilibrium. Now the ignorance of the people will accomplish, instinctively, that which the knowledge of the learned either cannot perceive or will not acknowledge. The people will force on a moral government, which is in very truth the government of God, and the promised era of terrestrial salvation.

What we mean by a moral government is simply this: a government in which there shall not be a single discussion about taxes or burdens of any description; for not a tax will be levied, the very name will be unknown; every trader will be free as the air he breathes; but the legislative council shall be exclusively employed in devising means for moralizing the people, teaching them, directing them, counselling, kindly entreating them, and never offending them, because never taking a penny from them.

This we call a moral government; you may think this is not possible! There is nothing more so. Such a government does not exist in the world we allow. All governments are taxing governments, and consequently they all quarrel with the people. We wonder much that the clergy, who, sometimes, for decency's sake, preach sermons on the text—"the love of money is the root of all evil," have never, hitherto, made this discovery. As long as a single tax exists, men will quarrel with government very justly, and government will, whilst taxation continues, be what we call "a state;" but as soon as taxation ceases, it becomes what we call "a church." It then enters upon the moral government of society, and the great council of the nation becomes the national temple, the pulpit of the people, from which issues nothing that is *unclean*, nothing that is corrupted by filthy lucre, nothing that partakes of extortion or meanness, or any other unholy passion. Hence suspicion will be lulled; virtue will appear more unsullied than ever. The people will look with veneration upon their rulers, and all abuse and satire and ridicule which are now justified by the selfish, pecuniary, and place-hunting views of political partizans, will give place to the sober and dignified criticisms of deliberate reason.

We say we call this a "church," but we are not particular about names; you may call it a state, or a steeple, or anything you please, that is what we mean. Words are troublesome things, they have so many meanings that we are always ready to abandon them whenever they are likely to occasion disagreeable disputations.

Now, the basis of this moral government is simply justice—a moral basis; and we are prepared to maintain that no power but the universal people can be just. Sir William Blackstone

himself admits this, "In a democracy, where the right of making laws resides in the people at large, public virtue, or goodness of intention is more likely to be found than either of the other qualities of government." "Democracies are usually the best calculated to direct the end of a law" (vol. i. § 2). We are willing to admit any degree of individual wickedness in the people—drunkenness, brutality, beastliness, cruelty, ignorance, anything you can imagine, however base, individually; still the combined action of a nation, composed even of such, must be just—self-love produces the justice. In a faction these produce the grossest injustice. Where bribery or corruption prevails, nothing can be worse than such characters; but where bribery is not possible, where the combined action is national, the spirit of wolves and crocodiles, in self-government, must produce justice. There is no mathematical axiom more certain than this. It is not the justice of the people that we look to, individually; they are devils, all and each. It is the people collectively which we personify; and which is just, by a law of Nature, similar to what mechanicians call the resolution of forces.

Let not, therefore, our opponents argue against us, by picturing the immorality and ignorance of the people. We will go as far as they go, and a step farther, to show them that the fact does not incommode us, in a universal system.

But then the hurry, and confusion, and roaring, and swearing, and drinking, and fuddling, of a public election! Aye, very bad! We do not like such things, and we have already seen quite enough of them. We have seen the human slaves taking the horses from the carriage, and yoking themselves instead. We have seen the fawning, hypocritical scoundrels, eagerly pressing through the crowd, to shake the hand of the temporary favourite, and, in a few minutes afterwards, damning him as a proud, empty-headed blubber, because he showed a reluctance to grasp their dirty paws. We have seen and heard them, roaring, and shouting, and drinking beer and spirits, and huzzainga, and cheering their generous entertainer, all for the value of sixpence; and the sight has actually made us Tories for the time being; and we doubt not many have been converted to Toryism by similar exhibitions. We abhor all such scenes, and could willingly apply the whip of small, aye, of large, cords, to every actor engaged. But it is the old system which produced all this evil. It is *we* who want to destroy it. Governments have always encouraged these shameful exhibitions; first, by suffering GENTLEMEN (!) to canvass for votes, and buy men's consciences; second, by erecting booths for polling, and gathering a crowd; and third, by limiting pollings to one or two days, and thus huddling people unnecessarily together, and driving them to market like so many cattle. Whether this is done intentionally to expose the baseness of the populace, we know not, but it has that effect. There is no necessity for it; and without canvassing and polling booths, nothing of the kind would be visible, and a stranger would be unable to discover what was going on. We want nothing but sobriety, whereas, hitherto, every thing that is calculated to create confusion, and occasion a riot, or a drunken exhibition, has been preferred by the legislators of our country. If it was not intentional on their part, there is a strange fatality in their ignorance.

Intellectual and moral suffrage, soberly conducted, is our meaning. A man should have a suffrage, because he is a man, not because he has property. Matter should not rule mind. Intellectual and moral qualification is the true qualification for government. Such a qualification Brougham recommends for national education. We hope to see it established; it will become the embryo, or the forerunner of a moral government, *i. e.*, "a Church-state."

A PRACTICAL GOVERNMENT! OR, WHO IS THE VISIONARY?

Nothing is more common than to brand, as visionary, systems of society which require a thorough abolition of the present anomalies of what is called government. "Impractical," is the common epithet which is applied to all such Utopian theo-

ries—"madmen" is the appellation which many of their supporters receive from a discerning *public*! or rather, from a hireling press, which writes, more to please and to humour a particular class, than to ameliorate the general condition of the people. The most sublime truths are frequently suppressed for a generation or more, by the mere force of ridicule and satire, incessantly, unmercifully, and irrationally directed from a particular quarter, and the rising generation is left to discover the trick that was played upon their fathers, and which is also attempted upon themselves. And what is a practical system of government, after all? a system under which men and women exist, build houses, and cultivate fields, and make clothing? There never was a civilized government, under which they did not do these things. Do you mean a government in which there is no confusion of authority? There never was such a government; and our present government is, perhaps, in that respect, inferior to any preceding. It is very doubtful whether one of our two houses of Parliament be even a legal assembly. Many of the Members' rights to sit as representatives of the people are questioned; all the Members for the city of London have their rights disputed; and throughout the country, a general outcry of corruption and intimidation prevails, to a greater extent than was ever before heard of in this kingdom. Do you call this a practical system? Moreover, when the House is legally constituted, what can it do? We are told by the leader of the House of Commons, that we cannot obtain a national system of education, on account of the vested rights of the Established Church, which refuses to hold communion in Christian fellowship with Dissenters! Do you call this a practical system? And when a leading Reformer, in the House of Lords, brings in a Bill for a mock-heroic system of education, we find such truckling to prejudices, such fear of offending one class, and such anxiety to conciliate another class, and such evident dissatisfaction to all classes, that the heart of the people never can regard it as a national boon. Do you call this a practical system? When you are told that nearly two millions of property is annually stolen in the metropolis, and many thousands of police on regular duty, as a preventive force for the preservation of property, it is somewhat ridiculous, surely, to call it a practical system. When we are told, that the annual plunder at the docks, in such articles as old iron, cordage, sails, twines and ropes, lead and solder, oars, blocks, tallow, oil, paint, pitch, tar, turpentine, and innumerable other articles, by the purchase of which many thousands of people make a comfortable and pretty safe living, amounts nearly to a million sterling—do you call this a practical system? When we are told that thousands of streets and lanes in London are in such a state of corruption, so infested with malaria, and the accumulated filth of ages, that the most fearful and unheard of diseases are incessantly being engendered in them, which are never heard of among people who enjoy clean homes and cleanly persons; when you are actually told by physicians, that a very large proportion of the young men of London are impotent with debauchery and disease, and as feeble in body as old peasants of eighty or ninety;* when you are told that the superintendence of such diseases is one of the most lucrative, and the very busiest department of the medical art, that domestic peace is spoiled, young love disappointed, jealousies aroused, and hatreds insuperable engendered by them, surely you cannot have the impudence to call all this a practical or a religious system? It is the reign of Chaos. They are madmen who support it—they are fools who preach in it: and the only wise men are they who try to destroy it.

There is nothing more visionary than the system which is actually in being.

It is an old and an impotent cry that "the world is too old to change." The Heathens said so to the early Christians, and no doubt conceived it impossible that Christianity could ever supersede the sacrificial system of Paganism. Had the Chris-

tians hinted at the establishment of a Hierarchy like that of Rome, and even maintained its practicability, what a loud laugh of ridicule would have been raised by the common-place minds of the day, whose only idea of practicability arose from the facts of society around them! Yet all that visionary notion of a spiritual despotism has been realised, and ascertained to be quite as practical as a Roman Republic. The idea of a social system is less visionary than any other political idea. It is the simplest, and easiest, and most practical of all, because it is the truth—the destiny of man, into which society must necessarily run. The idea is now fairly broached amongst the people; it will grow with time; it can never be abandoned. It is a living germ, and it has now a soil for germination which it never formerly had: the popular mind was never before directed to it. Plato taught it only to a few philosophers, and, like Owen, visited Dionysius, the tyrant of Syracuse, in the hope of persuading the tyrant to realize it in practice; but the people knew nothing of it, and could not know it, for want of means of intellectual intercourse. That intercourse has been obtained only in our own day. The printing-machine and the post-office are both essential to the efficacious working of a popular press. Our present post-office system is only about fifty years old. Before its institution the newspapers contained very little information; they had not the means of procuring or supplying it—there was no demand for it. Even so short a time ago as thirty years, the *Times* was a miserable production, inferior to the penny papers of the present day; it was printed by the hand-press, and it took a whole day to print off an impression; now it can, or may, print off at the rate of five or six thousand an hour. The printing machine was invented in 1811. It was thought visionary; the old hand-press is now visionary, and may be seen rusting in idleness in many a printing-office, whilst the visionary machine (that was) is doing all the work. Gas was also on the visionary list about the same time, and now both these visionary articles have become the most practical systems ever yet discovered in their respective departments. Mr. Palmer's improved system of the post office, using coaches instead of horses only, was also opposed as visionary, yet in a few years it trebled the income of the old system; in fact, almost every great and valuable improvement in the mechanism of society is accounted a delusion when first suggested. Though men, from sad experience, have found that old things must vanish away and all things become new, and, that the vulgar conceit of ancestral wisdom is merely a vague and unmeaning notion, which experience belies, still the vulgar cant is kept up, and handled by conservatives of every grade, both Tory, Whig, and Radical, and the simple people are wheeled into the faith, that that must surely be a delusive and impractical system which great lawyers and legislators and other leaders of the people condemn, or lightly esteem. In so doing, they retard the cause of Reformation—but thus it is, and thus, we suppose, it must be. Notwithstanding, we will persist, cry aloud, and spare not, but lift up our voice like a trumpet, confident that our views, both of politics and religion, are exactly in the corresponding position of the printing machine in 1812 or 13, and the gas light in 1807; and that, in a short while, disappointment will drive many minds towards them, as the only resting place for society at large, and the only school for private virtue and happiness.

THE SPIRIT OF CONTENTION.

Is it possible to steer through life without giving offence? We trow not. There is no imaginable species of conduct which is likely to prove universally agreeable. The very attempt to please all is disgusting to all. Men, therefore, generally ally themselves to a party, console themselves with the friendship of that party, and take a melancholy satisfaction in the hatred of the opposite faction. The hatred of an enemy thus becomes a test of worth, and you find many pert conceited little fellows, exclaiming, with evident symptoms of internal satisfaction; "they hate the very sight of me, my very name is an object of abhorrence." This hatred is the thing to boast of; the love of their own party is an inferior species of triumph to which only an

* We were told so by a physician of considerable practice, only a few days ago, and our quotation from Dr. Ryan, last week, confirms it. We had also some horrible disclosures made to us, of disconsolate wives, and their numerous suspicions—the rest may be imagined.

ordinary importance is attached. Nay, some people are almost ashamed to be loved, they would rather be feared. Love is too effeminate, hatred is something to boast of; but fear, fear! oh, fear, is a triumph! What a dignity and importance it gives to a conceited fellow, to make him believe that he is an object of fear!

There is therefore, in the nature of man, a sort of predisposition to offence, whenever an occasion for quarrelling is discovered; and where can he live without finding one? It is not in Church and State alone, where the spirit of faction prevails; it descends into the smallest circles of acquaintance and family. We have seen families divided into factions as bitterly opposed to each other as those of Whig and Tory—Evangelical and Moderate. Independent of all this, a man is always in danger of quarrelling with his friends; he calls on one, and displeases another, he calls on that other, and displeases a third; he ceases to call on any, and displeases all. If he treats a lady with attention, something is suspected, if he ceases that attention, he is reproached with cruelty. If he endeavours to steer a middle course, he is cold and reserved, quite a disagreeable creature, without gallantry, destitute even of good breeding, or of common politeness. What is the poor fellow to do? A lady is similarly circumstanced. If she is very frank, backbiters will speak more than they ought, if she is not very frank, she is proud, and thinks too highly of herself, and her station in society. If she laughs much she is silly, if she talks much she is a gossip, and if she quotes authors in prose or verse, she is a blue stocking, and if she is totally ignorant of authors, then she is merely an ignorant woman. If she is fond of dress she is vain; if she is not fond of dress, she is a slut. We should really like to see the man or woman who has a good character, it has never been our lot to meet with one.

"Deus in toto, Diabolus in partibus."

"God in the whole, the Devil in the parts."

All men are good, but each man is bad. When God made the species, he pronounced it very good,—very. But as for Adam and Eve, individually, they were only so-so.

THE AMERICAN SHAKERS.

THE following article, from the *Penny Magazine*, is so confirmative of our own social views, that we must insert it, although it is probable that it has been perused by the most of our readers. The United Society is a working Social System, with this principal defect, "the interdiction of marriage, or reproduction." It is also a religious society, with very narrow views of orthodoxy; but in spite of these two obstacles to popularity, it has proved a successful experiment, as the following article, from an intelligent visitor of the Shaker communities, clearly establishes. Any necessity for further observation of ours is entirely superseded by the remarks, *en passant*, of the correspondent of the *Penny Magazine*:—

"Our first visit to the Shakers was at their establishment, two miles from New Lebanon, Massachusetts. There are seven hundred members at Lebanon, and three hundred at Hancock, not far off. The Lebanon establishment is in possession of about three thousand acres of land, which are cultivated to a perfection seen nowhere else in the United States, except at Mr. Rapp's settlement on the Ohio, where community of property is also the binding principle of the society. This principle seems to us to have acted most beneficially wherever we have seen it in operation; and this is not to be wondered at, since there is an absence of all that makes people reckless, and a presence of all that stimulates them to do perfectly what they have to do. There is none of the anxiety about a daily provision which eats into the heart of the labourer, discouraging him in his toil: there is the division of labour which secures to him the best of what others can do in departments in which he is not skilled; and his mind is free to follow out the employment he likes best, with all possible spirit and energy. His kind affections, too, are engaged to do his best for others who are doing their best for him. The eyes of the whole community are upon him, also; and his pride is stimulated to turn

out his work as perfect as it is in his power to make it. It appears as if all these inducements were stronger than any afforded by the possession of property in securing excellence of work, plenty of luxury; for nothing has been seen to equal the perfection of the Shaker and Rappite arrangements, in their fields, vineyards, gardens, and homes. They have the best crops, the best wines, the best provision for the table, the best medicines, furniture, house-linen, roads, fences, and habitations in the country, with an enormously increasing amount of wealth, and very moderate labour. They are free from the operation of nine-tenths of the penal law; from all that relates to the protection of property. They have all that they want, and have the means of obtaining all that they can ever wish for. They are free from all temptation to theft and fraud; and the enormous mass of law which relates to the maintenance and transference of property bears no relation to them. The matter of obedience to law is wonderfully simplified to them. Offences against the person (a very small proportion in all societies), are all for which they can be liable to punishment; and property is generally at the bottom of these. I believe no member of these societies has ever been charged with any breach of the laws of the country.

"The road through the settlement had not a stone bigger than a walnut upon it. Not a weed was to be seen in any garden; nor a dung-hill in all the place. The collars of the men, and the caps of the women were white as snow. The windows were so clear, they seemed to have no glass in them. The framewallings painted straw-colour, and roofed with deep red shingles, were finished with the last degree of nicety,—even to the springs of the windows, and the hinges of the doors. The floors were as even, and almost as white as marble. The wood was put up in piles, supported by stone corner-posts; and not a chip was astray, not a log awry. The shop was stocked with the surplus of their manufactures; linen and woollen drapery; knitted wares of every kind; sieves, baskets, boxes, cordage, casks and pails; medicines, confectionary, and toilette luxuries. They command a very extensive sale for all their productions; especially garden seeds and medicines, of which they send large quantities yearly to London.

"Our party consisted of ten persons, in four carriages. Some of the men of 'the family' (settlement) appeared to take charge of the horses, and they cheerfully saluted those of their visitors whom they knew. They were in broad-brimmed hats and homespun vests and breeches. Those whom we saw at work in the fields, orchards, and gardens, were without their coats. The women were in a hideous costume: close caps of linen, like ugly night-caps; and gowns of drab homespun, made to fit nearly as closely as a skin;—too scanty to all appearance to walk across the room in. A female elder received the ladies of the party, and conducted them over the dwelling, without hesitation, but without grace.

"We had come several miles, and did not expect to be home again before evening, having formed our plans in reliance on obtaining a meal, as could formerly be done, at the Shaker settlement. Two of the elders, however, declared that furnishing food to strangers was out of the question. They had discontinued the practice from finding themselves overrun with company from Lebanon Springs: the profit was no object to them and the trouble and disturbance very great. This was reasonable enough; and the leader of our party acknowledged it to be so; but pleaded the reputation of the country for hospitality, which might be compromised if European travellers were sent hungry from the door. This plea prevailed; and when we returned from the gardens and shop, we found a good meal spread for us. The long table was covered with delicious bread, some wheaten, some of Indian corn, and some made with molasses; cheese, butter, spring water, and excellent currant wine. We really thought we could have gone on eating such bread and butter all day.

"Such is the bright side of the picture. Now for the other. 'In their separation from the world, they abstain from all politics, all posts of honour, and all 'vain pursuits'; that is, all pursuits which were not approved by the founders of their society. The consequences of this separation are very lamentable. They despise the 'world's people,' as they call all out of

their own body. They regard as unholy every concern for the social welfare of large bodies of people, if shown in action. They consider themselves in a condition of privilege; and their spiritual pride is excessive. In order to keep up the exclusive spirit at its highest tone, great tyranny is practised over the young people by their superiors. They are discouraged from conversing with persons out of the limit of the society; books are discountenanced; no such thing is dreamed of as the pursuit of science, literature, or art. These noble intellectual occupations are regarded as toys with which the holy should have nothing to do. The children, who are brought into the society by the admission of their parents, often find the control to which they are subjected quite intolerable. Many quit the society when of age; and some elope before that time; but not before they have had a long struggle with their pride. Being brought up to consider themselves in a state of privilege, and under special divine favour, they feel it a degradation to go down into the world; and especially to work for money. It is feared that not a few hearts have been broken in the struggle whether to endure the restraints of the society or the degradation of becoming 'world's people.'

"A friend of ours had a girl in her service, who had escaped from a Shaker family, after having been brought up in it from her early infancy. She had grown more and more weary of the insipid life, from which all books, amusements, and variety were excluded, when one Sunday she excused herself from church on the plea of illness. She saw from her window a pony grazing in the field; she could not resist the invitation to exercise and sport; got out of the window, jumped upon the pony's back, and galloped round and round the field. She went in before church was over; but she had been seen, and was reported. In the irritation of her mind she could not bear censure, and escaped. The service into which she entered for support was easy, and her mistress was like a mother to her; but her pride could not brook service; and after a struggle of some months she went back to the Shakers, not pretending that it was for any other purpose than the saving of her pride.

"It is much to be wished that the Shakers could admit the pursuit of knowledge in other departments besides agriculture, horticulture, and domestic economy. The world might derive a valuable lesson from witnessing what might be done in science, literature, and art, by a body so relieved from worldly cares, so possessed, through their principle of community of property, with wealth and leisure. They have not nearly enough to do; there is not one of them that could not devote some hours of every day to a new pursuit if the means were opened to him.

"They are 'peace men;' and, like all the other 'peace men,' in all countries, they dwell in a place of peculiar safety and fearlessness. No one attacks those who are known to be sworn neither to attack nor defend. In all our travels we have ever found that none have so thoroughly enjoyed their due as those who refuse to enforce it. We speak not only of personal security, but of welfare in commercial affairs. Of all creditors, the 'peace men' are most sure to be paid. Of all citizens the 'peace men' are the most sure to have their rights respected. The fact is honourable to human nature; and it points strikingly to times to come, when moral power shall be supreme over every other kind of force. In America, several religious bodies, besides the Quakers, hold the doctrine of non-resistance; and many individuals of every religious sect.

"The Shakers insist on simplicity of language. The only particular under this head which strikes a stranger is, that they have no titles of honour, and say yea and nay, for yea and no. They do not use the Quaker thee and thou. Officers are required for the superintendence of the establishments; and these must have some sort of title. Those who direct the spiritual concerns are called elders; those who take charge of the temporal affairs, deacons and deaconesses. There are also, in each society, ministers appointed to preach their doctrines, and to examine candidates for admission.

"Evils of great magnitude arise out of the principle of celibacy, on which the Shakers pride themselves the most. There is no need to point out the habits of selfishness, pride, and bitterness of spirit which must arise out of the exclusion of a whole society from the tenderest charities of life. It is unquestionable

that much impurity of mind, and some of practice, arises among a number of persons all bound under the same inexorable rule. The pleas they use cannot be satisfactory to the minds of all; and there is certainly much doubt, suffering, and even disobedience in some, while there is an immeasurable pride and prudery in others. The discourses of the preachers almost invariably turn on this point of discipline, and the boastings of the members always.

"The pleas for celibacy are, the example of Christ; some texts from Paul's epistles; and that marriage is ordained for civil purposes, and ought therefore to be left to the 'world's people.'

"The numbers are kept up by the accession of new members, who often bring large families with them. There is a great temptation to this in the prospect of plenty with very moderate labour. There is every reason to suppose that the society would have been more, rather than less, wealthy without their principle of celibacy. The growth of wealth is so rapid and sure under the division of labour and mutual aid maintained where property is in common, that every worker is found to be worth much more than he costs. Few deny this. The difficulty lies in applying the principle; this can be done only in a fresh and separate community, drawing apart, on convictions of its own, from all old ones. The Shakers have done this; and have gone a good way towards proving what they might have done without celibacy by receiving into their 'families' large numbers of children from the earliest age. Their society has in fact been an asylum for many helpless widows with large families; who, instead of being a drawback upon the resources of the community, have increased its wealth.

"Desiring to witness the far-famed Shaker worship, we visited another establishment, among the hills which surround the valley of the Housatonic, one fine Sunday morning in August. On a green hill-side, we passed a 'family,' where all were making ready to follow us, two or three miles, to the place of worship. A brother was putting the horses into the neat waggon; the children in their ugly costume, stood looking on; while an elderly woman seemed to be placed in each group, as a sort of superintendent. The men looked, in some instances ruddy and cheerful; but the women were all pallid, thin, and withered. I did not see one pretty face among them all. The children looked dull and spiritless.

"When we reached the house of worship, we found only one person within the walls; and learned that service would not begin for half an hour. We mounted the hill behind the church; and stood among the trees, watching the gathering of the members. We seated ourselves, at last, on one of the benches near the door, reserved for strangers. The women and children moved in like ghosts, keeping their blank looks fixed upon us as they passed, and till service began. We felt chilled by the soulless stare of the women; but there was a liveness in the glances of the little girls, from under their close caps, which seemed to prophecy that they would not stay, when once they could get away.

"The men, with five boys, ranged themselves on three rows of benches on one side the room; opposite the three rows of women. The service began with a prayer and hymn; the latter sung to a quick chant,—the most discordant terrifying music that can be imagined. Then ensued the dance,—the part of the service we had most dreaded to witness. There is no fear of being obliged to laugh, however; it is too shocking to be ridiculous: the little girls and some old women sat still; the rest drew back the benches, to leave a clear space in the middle of the room, and formed in a line, opposite to the three men who were to furnish the music. These three pawed with their hands, like dancing-dogs, to keep time, and chanted a sort of tune, without words, as it seemed; and in voices which might almost have been heard to the end of the valley. The dancing began by the members advancing in a kind of marching step, for six paces, then six to the left, then six backwards, then six to the right. Thus they went on describing a square, in a jiggling march for a considerable time. The boys stamped with much spirit, as we thought with glee; the women, unnatural and forlorn in their whole appearance, might have been taken for galvanized corpses.

"The discourse which followed was (of all subjects!) on civil and religious liberty; and, for a wonder, without anything about celibacy in it. There was some rather strange imagery; for instance, the American revolution was said to have drawn the last of the teeth of the red dragon. But the principle of liberty seemed to be clear to the preacher's mind; and he was so liberal as to speak of those of the world's people who live up to their faith. More singing followed: the members dispersed to their homes or their vehicles, and we drove down the valley, not much exhilarated in spirits by anything which we had seen and heard.

"It is scarcely necessary to say that this sect has never had to boast of any great men or women. No persons of mental power would join a society whose principle is to crush human nature, to extinguish the intellect, and disappoint the affections. It bears no character of permanence, at least in its present condition. The war against Nature (which is a war against the Former of Nature) must be a short and losing one. If any strong mind should have inclination and opportunity to cast out the bad principles of the sect, retaining the good, the UNITED SOCIETY might become an important agent in improving man's social condition; but if this is not done, and speedily, the institution will probably languish to its death, being remembered only as an added example of man's social eccentricities."

DEATH.

THERE is a very great variety of deaths. Some merely fall asleep; death seems to be more a pleasure than a pain to them; they would feel sorry to be roused from the sweet repose into which it lulls them. Others struggle very hard for life, and die in very great apparent agony. Whether the pain be so great as the symptoms indicate, is impossible to determine; but the strength which some dying people evince at their exit, and the violent agitations into which the body is thrown, imply that life is violently obstructed, and that the pain must correspond to the vigour which is to be overcome. We have seen very few die, and consequently, have not much personal experience; but we have read and heard much of the termination of life. We have also some little personal experience, which exactly corresponds with the testimony of others. We have seen the violent throes of one whose whole frame was convulsed, and whose violent motions at the close of life were such, that all the combined strength of half-a-dozen attendants could not subdue them. We have anxiously inquired since we witnessed this scene whether it was right to employ this violence to repress the movements of those, who, in vulgar phrase, "die hard." There can be little doubt that their movements give them relief; nature itself instinctively directs them to roll and to kick, in order to mitigate the sufferings they experience. But the officious kindness of surrounding friends holds the dying patient by the legs and arms, presses upon his chest, and blockades him on every side, so that the efforts of nature are counteracted, and the expected relief denied.

Many are insensible for hours before death, and gradually disappear, so that the moment of death cannot be determined. Others recover their mental clearness a little before their latter end, and suddenly go out like an expended taper; death being only a gentle start or shock which produces no disagreeable effect upon the system. Others are delirious for days or hours previous to dissolution, and sing, and roar, and laugh, with a most revolting apathy of countenance and vacancy of eye. Drunkards are frequently of this class. Drunkards have strange visionary appearances to terrify them at their exit. "Do you see that black dog?"—"that cat with a long tail?"—"Don't you see that tall black looking fellow at the foot of the bed; send him off," &c. These are common expressions from the lips of a dying debauchee. Some fight with what they call devils, little fantastic images that flicker before them; they square at them like men going to engage in a boxing match; sometimes they defy them to do their worst, and challenge them to come on. There is no deception on a death-bed; these things are really seen; but they are in "the eye," as the

saying is, they are creatures of the mind, such creatures as the mind forms in dreams, and have the same objective reality as a lively dream has. But there is this difference between them and a dream, that they are seen in conjunction with objects in the apartment; they are seen *on* the bed, *on* the drawers, *on* the floor, chairs, &c.; so that the mind has a double vision, a vision of the apartment and its contents, and a vision of its own creations at the same time. Those who have ever been troubled with waking night-mare can, perhaps, imagine what this blue-devilism is. We have experienced the former for two weeks in regular nightly succession; we produced it at first unintentionally by a cheese supper; we afterwards kept it up intentionally, merely for an experiment. It was not at all disagreeable after a few evenings. We were always so much awake as to see the apartment distinctly. The incubus came regularly with a whistle or species of hissing. There was then a distinct and sensible jump of an animal, about the size of a dog, from the floor, which always came from the same side of the bed: there was the distinct pressure of the feet, and even of each separate toe, and the perceptible tread of four feet, first walking from right to left (as we lay on the back), across the ankles, then walking up the left side, crossing the chest, walking down the right side, and crossing the ankles once more, coming up the left side, then resting on the chest, and thence finally dispelled by a violent effort to recover breath. It never, on any occasion, passed the chest twice; and we were conscious all the while that then and there it must stop—We never saw anything; but the feeling is a most singular phenomenon. Wise folks of course tell us, that it is occasioned by indigestion, but this makes us no wiser. Why indigestion should jump like a cat, and whistle or hiss like a goose, is more than we can understand; that it is connected with indigestion we grant, but we would sooner believe that it is the cause of indigestion, than indigestion of it. Perhaps it is the Spirit of Indigestion.

Whatsoever it be, there it is, and so it is, and who can help it? He who takes a light supper can help it. The Spirit of Digestion will then defend him, and the cat won't jump upon him; we have found out this from experience. We are never annoyed by puss now, and perhaps we may be able to steer clear of those other demons that haunt the death-beds of the intemperate by the same simple process. Do not irritate your nature either by indigestible food or intoxicating liquor; appease all the spirits that surround you, whether of digestion or of indigestion, by a simple, a temperate, but nutritious diet; preserve your mind in a corresponding state of equilibrium, let no master-passion, like Aaron's rod, swallow up the rest, but give full development to all that is simple and innocent in your nature, and repose with tranquil confidence in the eternal plans of Providence both for time and eternity, and if this do not preserve you from cacodemons in life, and secure tranquillity at your dying hour, nothing else will; for nothing is more likely to procure a peaceful death than a peaceful and temperate life.

Death is an ordeal through which we must all pass; and the means of alleviating the pains which accompany it are of vast importance to all. They are not only important to the sufferer, but to his surviving relations. How harrowing it is to a surviving relative to think of the hard and agonizing throes that accompanied the dissolution of a regretted friend? It is an endless punishment. It embitters the remainder of life to many, and spreads the sackcloth of melancholy and desolation on the countenance, hurrying thousands with rapidity to an early grave, and overcasting society with a gloom which would not exist were death not thus made more horrific than it naturally is by the follies of intemperance.

The life is generally the parent of the death. They who do violence to their stomachs by excesses of any kind, who daily experience head-aches, and stomach-aches, and side-aches, and other maladies, rather than forego some little temporary gratification of an animal passion—lose more than they gain, live unhappy, and have very little prospect of an easy dissolution, or of leaving behind them that soothing of the soul, which the virtuous at death bequeath to their friends.

IRVINGITE PRANKS.

We perceive, from the public papers, that the Spirit is playing the same game amongst the Irvingites, that he has often played amongst the Southcottians, and all similar sects, who suffer themselves to be guided by direct inspiration or revelation. A Mr. Ballard, a leader amongst the Irvingites, at Milford, near Southampton, has been commanded by the Spirit to denounce the members of the Milford congregation, and declare to them, in the name of the Lord, that they were in error, forcibly dismissing them from the chapel, and employing a builder to raze it to the very ground. We think the Spirit acts very judiciously, and only wonder it could have borne so long with the sickening cant, and sanctimonious profession of superior holiness, which invariably belongs to all such narrow-minded sects. This, however, is an act of insubordination, for, according to the constitution of the Irvingite Church, the Apostles have the control over the spirit of prophecy. This is as it should be, for reason is superior to revelation. Reason is the Son of Man, to whom judgment is given. It is the Lord of human society, and all insubordination to reason will suffer punishment sooner or later. We fear, however, that the Irvingite apostles are too easily led by the Spirit, and have not the moral courage of judges and sovereigns, to check its extravagance, and preserve its sobriety. Their constitution is a step in advance of Southcottianism. The latter is wholly guided by revelation, and many curious games the Spirit has played with it. We shall mention only one. It took place under the leadership of George Turner, in 1817. George was informed by the Spirit that a great earthquake was about to take place, which would shake the foundations of the old world; but the Lord's children would be safe. The kingdom of Shiloh was confidently expected to begin at the time. Great preparations were made for his coming. Even clothes were made for him, without taking his measure. The Spirit told them to make the clothes large, as Shiloh would be tall of his years. We know a man, who was at the expense of the coat. We have seen it; he now wears it, having kept it for nearly twenty years in a chest, waiting for Shiloh, until the Spirit, through a prophetess, told him to wear it himself, as Shiloh was in him. We know a lady, who ordered a silver snuff-box for Shiloh, thinking it probable that the Messiah would like a pinch occasionally: our eyes have seen, and our hands have handled, the identical box, with Shiloh's name on the lid. Well, we say the great earthquake was to take place in 1817, and Shiloh was expected to come and reign. It was expected at midnight, and as the believers believed themselves safe, and the aristocracy in danger, several went out to the gentlemen's gates, and waited anxiously for the coming shock and general wreck, intending to take possession of the deserted seats, houses, and equipages of the rich. Some, more fearful, stayed at home, and prayed. Twelve o'clock came, and no earthquake. All were disappointed, and the Spirit made a suitable apology, as usual. An Owenite, however, informs us, that the prophecy was really fulfilled; for it was in 1817 that Mr. Owen made his celebrated declaration of his Social System, which shakes the foundations of old society, and announces the coming of another. If such be the case, one gave the prophecy, and another fulfilled it, and each party despised the other. Providence works the machinery of Nature with two principles—attraction and repulsion. The repulsion of sects, and of individuals, is working to the same general focus. The time is dreary and long which the process requires; but all parties have one object, general amelioration, and this when the means of social intercourse are multiplied and facilitated, will ultimately lead to unity of method. The repulsion and resistance of the different parties will work, and work vehemently, until a compromise is effected, and the truths of all sects, for each has a little, are acknowledged and acted upon.

The great defect of all such religious sects is that they have no better social or domestic economy, than that of the world around them. They differ merely upon an abstraction, a point of faith. The Shakers are nearest to solid truth; but as if there was a fatality about all partial views, Shakerism is also rendered inoperative, by the unnatural law of monachism, or

celibacy; and as for infidelity, it never has been able to make the rope of sand hold tight. Nothing short of universalism, in our opinion, can bind men together; and that holds communion with every religious feeling, gives a political existence to every adult, and derives its authority from the concentration of the public voice.—*Deus in toto.*

GEORGE WHITEFIELD.

NOTHING that remains to us of Whitefield in his sermons and sayings, accounts for his astonishing power of moving an audience. His manner was much. He was a consummate orator, and appealed as strongly and openly to the passions as ever did Garrick or Kean. He stamped, he wept, he lifted up his voice like a trumpet, he besought with tears. His domestic companion and assistant, Winter, says of him:—"His freedom in the use of passions, often put my pride to the trial. I could hardly bear much unreserved use of tears, and the scope he gave to his feelings." And there is no doubt that the best-acted scene, too often repeated, must tire or disgust the constant spectator. Whitefield performed his best sermons exactly as Siddons or John Kemble went through their favourite characters. Foote and Garrick maintained that his oratory was not at its full height until he had repeated a discourse forty times. Garrick affirmed also, not wholly in jest, that he could make men weep and tremble by his varied utterance of the word Mesopotamia. Franklin, by hearing him often, came, he says, to distinguish easily between sermons newly composed, and those he had preached often in the course of his travels. His delivery of the latter was so improved by frequent repetition, that every accent, every emphasis, every modulation of voice was perfectly tuned and well placed, that, without being interested on the subject, one could not help being pleased with the discourse; a pleasure of much the same kind as that received from an excellent piece of music. But if to this is added the deep interests enforced by the home-thrust arguments and passionate appeals of the preacher, addressing a fascinated audience on the solemn and awful themes of "righteousness, temperance, and the judgment to come," the effect may be imagined, and the nature of Whitefield's power understood. He seems to have possessed another quality, which is unnoticed by his admirers, and which, though an original power, is perfected by use. This quality, call it *test* or *address*, or by whatever name—the spontaneous offspring of entire sympathy with the audience, and of masterly self-possession—must have been remarkable in Whitefield. He never submitted to the tame benumbing custom of reading his sermons. They were prepared, studied, and most carefully recited. Southey, in his *Life of Wesley*, when noticing Whitefield's art of speaking in the pulpit, conveys a most useful lesson to all young preachers:—"And the sermons," he remarks, "been delivered from a written copy, one delivery would have been like the last; the paper would have operated as a *spell* from which he could not depart; invention sleeping, while utterance followed the eye. But when he had nothing before him except the audience whom he was addressing, judgment and the imagination, as well as the memory, were called forth. Those parts were omitted which had been felt to come feebly from the tongue, and fall heavily on the ear; and their place was supplied by matter newly laid, in the course of his studies, or fresh from the feeling of the moment. * * * But the salient points of his oratory were not prepared passages—they were bursts of passion, like jets of a Geyser when the spring is in full play." The truest notion of the peculiarities and originality of his oratory, is to be obtained from those incidental bursts and jets, when, as a homely critic said, "he preached like a lion." One of those rampant outbreaks, which made their way like an avalanche, was witnessed by David Hume, who had been attracted by the fame of the preacher. He says:—

"Once, after a solemn pause, he thus addressed his audience:—'The attendant angel is just about to leave the threshold of this sanctuary, and ascend to heaven. And shall he ascend, and not bear with him the news of one sinner, among all this multitude, reclaimed from the error of his ways?' To give the greater effect to this exclamation, Whitefield stamped

with his foot, lifted up his hands and eyes to heaven, and cried aloud 'Stop, Gabriel; stop, ere you enter the sacred portals, and yet carry with you the news of one sinner converted to God.' * * * This address was accompanied with such animated yet natural action, that it surpassed anything I ever saw or heard in any other preacher.

Winter, in describing his manner, says—

"As though it were no difficult matter to catch the sound of the Saviour praying, he would exclaim, 'Hark! hark! do not you hear him?'—You may suppose, that as this occurred frequently, the efficacy of it was destroyed; but, no; though we often knew what was coming, it was as new to us as though we had never heard it before.

"That beautiful apostrophe, used by the prophet Jeremiah, 'O earth! earth! earth! hear the words of the Lord!' was very subservient to him, and never used impertinently."

Stories, anecdotes, and the most homely illustrations, brought from familiar life, were, with great tact and aptness, drawn into the service of the sanctuary. He frequently spoke of himself, having first engaged the sympathy of his hearers so far as to make his egotism agreeable to them. This relaxation alternated pleasantly with his fits of vehemence and passion. Whitefield omitted nothing requisite to the complete effect of his speaking. He was neat in his dress, and studiously careful of his attitude and gestures; he was never put out—he never stumbled for a word. "Nothing awkward, nothing careless appeared about him in the pulpit." "He left nothing to accident that he could regulate by care."—(From *Tait's Magazine*.)

THE SCARLET SISTERHOOD.

ONE of the first acts of the reign of Elizabeth, the virgin Queen, and founder of the English Church, inflicted the punishment of hanging, cutting up, and bowelling alive, all those who should maintain the spiritual supremacy of the Pope, and deny that of the Queen. Fifteen Catholics, upon this charge, suffered this horrible torture, besides one hundred and twenty-six priests, for being priests, and continuing obstinately to be priests; and sixty laymen, for hearing mass, and showing hospitality to priests. Margaret Middleton, of York, a lady of noble connexions, accused of the latter crime, and refusing to speak, and thereby betray her spiritual guides, was pressed to death, on York Bridge, her hands and feet being fastened to four stakes, and a large board, loaded with heavy weights, placed on her body. She merely said, "It is as well to go to heaven this way as any other."

We do not like to belong to a bloody Church. A Church that has even one drop of blood to answer for is not for us. Roman Catholicism is drunk with blood, and Protestantism was spawned in it. We belong to the universal Church, self-governed by the combined moral influence of the whole mass; not by a college of cardinals—not by a confederacy of gentlemen in holy orders—not by a hereditary race of legislators—not by a motley group of ten-pound conscience-brokers. All these are illegitimate authorities. We owe no allegiance to them. The are necessarily corrupt.

POLYGAMY.

MANY proofs might be adduced to prove that Polygamy produces more female offspring among mankind, and other animals (Hippocrates, Harvey, Willoughby, Forster, &c.), and that more males result from monogamy.—*Dr. Ryan*.

[We cannot otherwise account for the number of wives which both rich and poor obtain in polygamous countries. At the siege of Babylon, under Darius Ochus, it is said the Babylonians being sorely reduced for want of provisions, resolved to destroy all of their fellow citizens who were unserviceable in the defence of the city. They, therefore, assembled together all their wives and children, and strangled them; only every man was allowed to keep his best beloved wife, and a maid servant, to do the business of the family. Even then, the women must have been two-thirds of the population. Darius, having taken the city, impaled three thousand of the rebels, and caused fifty

thousand women to be introduced into the city, to supply the place of those which had been murdered. In Thibet, where half a dozen, or even half a score of men have one wife in common, we suppose female children must be "*rara aves*," that is, rare birds, and angelic visitors. This, however, is a wonderful accommodation of Nature. Moreover, it shows the liberality of God, who thus good-humouredly indulges the peculiar views of morality, and domestic propriety, which prevail in different countries.]

It appears, from what Lord John Russell says, that the principal obstacle to national education is religious sectarianism. Is not this enough to make men curse religion? Rather than that the Bible be not read in the schools, the bishops would suffer the people to remain in ignorance. Nay, the Established clergy, for the most part, would prefer national ignorance to a system of education not under their own control! This attempt to enforce unanimity, is the very thing that prevents it. The best educated countries in the world are those in which the clergy and aristocracy have least power—republics and despotisms. In Prussia, the proportion of educated children to the population, is one to six; in New York, one to four; in England, one to seventeen! Universal education must make a great revolution in the character of roguery; it will introduce more head and pen work into the game of knaves, and thus enforce a radical change in the forms of society. It is only as a means to this end that we regard it as a good. "*Directly*" reading is not a good, because it is a solitary and unhealthy employment; but it is an ordeal, through which society must pass, to come to social unanimity and uniformity upon first principles. Were this latter end gained, knowledge would become alive in society; at present it is actually dead, and buried in books of controversy and party spirit.

"Happy the son whose father has gone to the Devil," is an old proverb, which alludes to the good fortune of the son whose father died out of favour with the priesthood, by leaving none of his property to the Church, by which he doomed himself to damnation for the sake of his family.

"UNDER THE ROSE."—The clergyman wears a rose in his hat, and in confession, what is spoke in his ear is, in effect, "under the rose," and is to be kept secret, as being under the seal of confession.

TO CORRESPONDENTS.

An Old Subscriber.—We are much obliged to An Old Subscriber for his letter. We fully agree with him in respect to Popery, Protestantism, preaching, &c., and we have no doubt that what we mean by theological authority will not displease him. Authority can do two things—set up, and pull down. Now, a universal Church composed of the whole people, would NECESSARILY be a moral Church, and keep down intellectual or doctrinal controversy, where it ought to be kept—that is, in individual or private life, so that it never would reign publicly. It is the clerical bodies of Popery, of Protestantism, of Wesleyanism, which make doctrine and dogmatism rule over us. Were these clerical bodies superseded by a universal Church, morality would reign. We are much mistaken if our correspondent does not fully perceive our meaning by this week's Shepherd, which is full of the subject.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 26, Vol. III.]

SATURDAY, DECEMBER 23, 1837.

[PRICE 1½d.]

A MORAL GOVERNMENT.

Say, why was man so eminently raised
Amid the vast creation? why ordained,
Through life and death, to dart his piercing eye,
With thoughts beyond the limit of his frame,
But that the Omnipotent might send him forth,
In sight of mortal and immortal powers,
As on a boundless theatre, to run
The great career of justice?—*Akenside.*

GOVERNMENTS can only deal with visible things, and in relation to external behaviour alone can they rule mankind.

The peculiar feature of old society is its departure from this law of Nature. In all ages, theories, dogmas, and intellectual propositions, have been imposed upon man, and the reaction has been very deplorable. The rulers attaching importance to one proposition, their opponents could not fail to attach equal importance to the other. The supreme power resolved most gravely, that Mary, the mother of Christ, always was, and still is, a virgin. The opposite party, being compelled to avow this, could not fail to attach importance to its denial; and being trained from infancy to the affirmative or negative, and seeing it keenly contended in the schools, and in the market-places, seeing the people fight over it, and butcher each other on account of it, each successive generation only widened the breach, until some new and more engrossing subject of disputation absorbed the general interest; and, even then, the old was established by law, and enjoying the luxurious ease of endowment.

This system is the clerical system, which is incorporated with all governments. It can never form the basis of a good government, because it proceeds upon the principle of blinding the intellect, which is free by nature, and thus it becomes an obstacle to all progressive improvement.

But it may be replied, that the moral government, which we prefer, is equally illiberal, inasmuch as it binds the behaviour. Now this is the very happiness of a moral system—to set a hedge around the passions—to curb all the wild and savage recklessness peculiar to the ungoverned—to prescribe a course of innocence and of enjoyment—to give protection to all—and as much individual liberty as is compatible with universal happiness.

Thought, or intellect, or opinion, or feeling, is entirely different. It is the source of conduct, but cannot be subjected to a law. It must be free, and the expression of it ought to be free. Governments, therefore, have nothing to do with it. If the individual's opinions be so very different from the common opinion, that he is necessarily impelled to act differently, he must suffer according to the law which regulates the conduct he pursues. If murder, he must suffer the consequence. If assault, he must suffer as an assailant. But the more teaching of a doctrine is not amenable to a moral tribunal, unless it directly inculcates the commission of a crime acknowledged by all to be deserving of punishment.

Such questions, therefore, as the *Virginis partus*, the birth of the Virgin, or the divinity of Christ, or transubstantiation,

or the resurrection of the body, or, in fine, any other theological question, are beyond the sphere of governments, and ought to be left entirely to the Protestant principle of individual opinion.

If a Church receives one or more of these questions, and rejects others, then we call it a sectarian Church; but if it admits them all into its bosom, upon condition merely that they subscribe to these two fundamental principles—*first*, "Love thy neighbour as thyself;" and *second*, "The spirit of Christ is the combined influence of all the Church, genuinely expressed upon a moral subject;" then it is a universal Church.

These two propositions are, in some sense or another, universally received. And it is somewhat remarkable, that they constitute the sum total of Christ's teaching. The first is a beautiful moral precept, too beautiful for practice, but a *beau ideal*, which forms the very best possible basis of a moral system. No man can deny the beauty of it. Tory, Whig, and Radical, believer and infidel, all agree in acknowledging its perfection. There could be little disputation about the value of the precept, and no heresy could be taught respecting it, which conduct would not easily detect. A clergyman who preaches in opposition to the primitive Christian morals, of all things in common, and adduces the language of these same primitive Christians, to prove the truth of some ecclesiastical dogma, is easily detected in his heresy, under a moral government. The clergy do so now: but they live under a dogmatical system. Dogma is here of more importance than conduct. Their conduct is, therefore, judged by the times in which they live—by the creed of the church to which they belong; and in this respect, perhaps, all is right. But were the primitive Christian morality established by a moral government, there could be no heresy taught upon this article of faith, which even children could not detect. All men can judge of moral heresy, but no man can judge of intellectual heresy.

In a church, based upon this principle, therefore, we would have this advantage, that heresy could be detected at once, and unanimously.

The second law of a universal church may, perhaps, be expressed differently. But, in a Christian country, the language we have employed is more suitable, namely, that "the Spirit of Christ is the collective spirit of the universal church, expressed, not intellectually, but morally."

We believe that this truth, variously expressed, is tacitly acknowledged by all men. It is used argumentatively by all parties. The general assent of mankind to a proposition is even employed as argument on intellectual subjects. It is used by divines, to prove the existence of Deity, the immortality of the soul, the divine institution of sacrifice, of the

* Here we must acknowledge our obligation to an old subscriber, for calling our attention to an assertion we formerly made, namely, that the Church should have theological authority. It was not altogether correct. It cannot positively decide on a final truth. Its authority is purely moral, and can only approve or disapprove; and as it cannot establish a dogma neither can it suppress or reject one,

Sabbath, &c. Universal approbation is the highest compliment a public man can receive; all parties rejoice in it. Universal execration is the greatest punishment which can be inflicted. Universality of assent is thus almost tantamount to a demonstration of a fact. There is an apparent objection to this assertion, in the circumstance of the occasional protestations against its truth, which we hear, from time to time, amongst the unpopular religious and political parties. Even Lord Brougham himself, a few days ago, publicly denied that he regarded it as a test of truth. But remember, truth is partly an intellectual subject; we do not affirm that universality of assent or dissent is a test of scientific questions. We apply it only to the feelings and the instincts of Nature; to that department of our being, which is out of the reach of science, to which science never can, by any possibility, approach. Wherever reason can or ought to lead us, there we are left to reason and experience; in those departments of knowledge is the best guide. In chemistry, or astronomy, or geology, we are guided by reason, or induction only; feeling, or imagination, or instinct, has nothing to do with these. On these subjects the people cannot judge; their verdict has no value. But on a point of feeling, maternal, paternal, filial, social, we say, decidedly, universality is a test, and a final court of appeal—and the spirit of the people at large on that subject is the Spirit of God, “infallible,”—“infallible.”

The universal Church, therefore, is a moral Church; particular churches are doctrinal churches.

The Roman Catholic Church is not a Catholic, or universal Church, because it is a dogmatical Church. And as all the other churches are less Catholic than itself, we see no possibility of obtaining a universal Church, but through the State. The Churches must be absorbed by the State. The English Episcopalian Church is at present a part of the State. The State is, therefore, a sect, and the Church is the main obstacle to all progress towards universalism. It is the great enemy of all reformation. Instinct seems to teach it this fact, that its latter end is approaching.

But when the Established Church is dissociated from the State, will this be sufficient to make the State universal in its principles?

No; it has got another stage to run after that. It has its intellectuality to banish!

This may seem strange to modern educationists. To banish intellectuality from the State! This is surely a delusion.

It is not a delusion. The intellectuality of the State is playing the devil with society. You may just as well try to fathom eternity as to fathom any political question. No man understands politics any more than he understands God Almighty. The lawyers know no more about legislation than the clergy about theology. It is a marvellous fact that we are paying millions upon millions of our hard-earned money to keep up “mystery, mystery—Babylon the great, the mother of harlots, and the abomination of the earth.”

What then is to be done? Remove all subjects of political discussion, that is, the levying of money—from legislation, and one large mountain of mystery would at once be cast into the sea. Let the simple rent of the solid land be the everlasting revenue of the country. It is equal to fifty millions. You may easily find even an equivalent for those whom you seem to rob by this process. Make a new code of forms for social transactions, and leave the administration of justice to the “living law” of judge and jury’s conscience. Educate every child, and train it to a profession. Classify all men, and let each man be known to his class, having power in it, and with it, as a member of the great fraternity for the self-government of society. Encourage social intercourse in masses, for the acquisition of knowledge, for amusement and recreation—provide accommodation for all such purposes. Please mankind, and you will be pleased with them; kindness always calls forth a smile, even from the most perverse.

This might be a preparatory step to better things; but even this is more than we are sanguine enough to expect; we throw out the idea in order to give it birth in those minds which have not yet received it, that they may digest it properly, and teach it to others; that it may spread abroad in society, and

become the germ of a new spirit of agitation, which must of necessity arise when our present struggle for suffrage and other preliminary matters is over.

Popular suffrage, under a political system, will never benefit the people of this country to any great extent. It will be a long and a dreary while before it ever bring them even into a condition so prosperous as that of their American brethren. America, moreover, must, for many centuries, be blessed with advantages which we do not possess. It has an immense surface of unclaimed land in its back settlements, which is yearly adding to its internal resources. But, even supposing we were as comfortably circumstanced as our Transatlantic brethren, what a pitiable state of society it is for knavery, for avarice, for theft, for self-interest, for drunkenness, ignorance, and every imaginable wickedness! The difference of a few pounds in taxation, or shillings in weekly income, or quality and quantity of bread, beef, beer, and potatoes, is a trifle compared to these. Who knows the miseries inflicted even on families apparently well-conditioned, by the craft and villany of commercial bargains in every department of American industry? Misery is not confined to those only who want bread, and have no comfortable dwellings, though these are more immediately deserving of our compassion; it steals alike into the drawing-room and the cottage, and banishes sleep from the bed of down, as well as from the hard and cold plank, or the harder and colder stone. A little gain we do allow you might obtain by the alleviation of some legislative burdens, but we regard it as very, very little indeed. Politics cannot serve you. The Tories themselves, and the Whigs, have already acknowledged this. How often has it been repeated in Parliament by members of every party:—“Parliament cannot interfere, can do no good to the complainants.” This has been said to the hand-loom weavers, and to the stocking weavers, and to numerous other petitioners. Yet these petitioners never seem inclined to take Parliament at its word. They insist upon boards of trade, minimums of wages, compulsory regulations of wages, and other visionary schemes, which the legislators know well are wholly impracticable; but how few of the people seem yet to be convinced that politics cannot save them—that moral government alone can redeem them, and bring them, with a high and uplifted hand, into a land flowing with milk and honey.

It is for the purpose of removing, as far as we are able, this popular delusion, that we write. We know it cannot last very long. Times are now favourable for removing it. We have now a large and widely circulated press, and a reading population. We have only had these a few years. We have got a trial of Reform, it has proved a delusion. We have got a trial of a few reductions of taxation, they are not perceived. Our feelings are still irritated as much as ever by the miseries of life. Wherever we move we see the evil of the system pursued. We have moral and intellectual wants which cannot be gratified, affections which cannot be answered, innocent desires which cannot be indulged, and all those feelings which we wish above all other feelings to suppress, are those chiefly which are roused into unholy action. It is a hell, and men are all devils, from the best to the worst. Virtue itself is only a species of vice.

PROPHECY.

It is necessary to say a few words upon prophecy as an accompaniment to our article on modern miracles. We hope we shall satisfy all but the dogmatic, whose patronage we do not court, that the phenomenon of prophecy is not an isolated phenomenon, belonging to a particular age or people, but a natural and universal fact, belonging to the constitution of man, and developed at times in all ages and amongst all people. There is no truth of which we are more convinced than this, that what is called the gift of prophecy or revelation, is entirely misrepresented both by believers and infidels, who are equally under delusion respecting its nature.

A believer regards it as infallible in its testimony; an infidel denies even the fact of the phenomenon. A believer regards with peculiar veneration, the imaginary character of an

ancient seer, whose body has long ago mouldered into dust, and of whose personal appearance, not even a tradition has preserved a radiant image. The messenger of the Almighty is sufficient material for the imagination to begin with. This supereminence of calling suggests a corresponding excellence of shape, mind, and character. All that a poetic soul can conceive, and the spirit of painting inspire, is employed to produce the *beau idéal* of the legates of heaven.

And in their looks divine,
The image of their glorious maker shines,
Truth, wisdom, sanctitude, severe and pure.

This is a poetical delusion, and we are all the creatures of the ignorance or craft of it.

On the other hand, an infidel will tell you that such men as Isaiah, or Jeremiah, or Hosea, were either enthusiasts, who *imagined* they saw visions, or they were impostors who *pretended* they saw visions, or their books were not written by themselves, but by the priests to bewilder and enslave the people, or by some well meaning but fraudulent reformers to excite the people *against* the priests! All these absurdities have been brought forward by the infidel party, in their hopeless attempts to philosophize the question, and the result has only been exposure of ignorance.

Prophets have lived in all ages, men equal in foresight to the Jewish prophets, and some in many respects superior (we always except the two founders of the two great and marvellous dispensations of Judaism and Christianity). They live at this day in all countries, and may easily be discovered by the inquiring mind, and one or more is always, in succession, starting out of obscurity and calling the attention of people to his revelations. These *naturals*, if we may be allowed to use the expression, are the simple children of Nature. They were the first philosophers, and have only been thrown into the shade, by the substitution of scientific reasoning for natural impulse, as the director of human affairs. They were evidently the earliest writers, and their communications were preserved as the commands of the Almighty; printing was unknown, literary criticism unheard of; literary controversy never even thought of; books were rare, and such writings, with the public records, were probably all the books that existed amongst the early Jews. Very few of the prophets committed their prophecies to writing; many of those which were committed are lost; and what remain in the Old Testament are probably all the books that Ezra could find belonging to the Jewish nation, the entire library of the Jews. When the Jews returned from Babylon, they began to have intercourse with the Greeks. Literature was more common; antiquity beyond the Babylonish captivity was sacred. The Bible, therefore, became an ancient relic as soon as it was collected; it was sacred at once, and veneration for its antiquity would naturally prevent any addition to its contents. This we believe in the simple history of the Old Testament.

But we are not to infer from this that there were no prophets after Malachi. The *writing* prophets were the meanest of the class. Elijah has not left a syllable on record. Elisha, second to Elijah, is equally mute. John the Baptist, one of the greatest of all the prophets, is merely transiently mentioned in a few words, and scarcely even a saying of his recorded. Since the times of the apostles, the fathers enumerate many individuals possessed of gifts similar to the old prophets, preserving always a peculiar veneration for those of whom they knew nothing. St. Augustine writes very copiously of visions and revelations, and describes several individual cases very minutely. Several of the rites and ceremonies of the Roman Church were given, and the tombs and relics of the martyr discovered, by revelation, and prophecies were given and recorded in the same style as of old with such profusion that, if the Christian Church had collected all its prophecies, as did the Jews of old, the Bible would now have been so very large that no ordinary house could hold it. Many of these prophecies we have read, and some of them are really sublime; some are inferior, some superior to the old Testament prophecies. The latter have the advantage of being select, and of being translated by learned

men into a pure and correct phraseology, far superior to the original, which is very inaccurate and obscure, like the writing of the vulgar, which is always more incomprehensible and doubtful in construction than that of well educated persons. The former, that is modern prophecies have not been so favoured, and the vehicle of printing being easily obtained, they are less select, and more exposed to contemporary criticism. This has partly been the cause why they have been subdued; but the principal cause is the ambiguity and unsatisfactory nature of prophecy itself, which has lost its reputation by the mystical deception with which it invariably plays upon the faith of its receivers.

Few of our readers are aware, that there are prophecies, originally given in English, in the same style as the Old Testament, in which similar judgments and mercies are pronounced upon our cities as upon those of ancient Asia. The burden of the Lord to London, Bristol, Bath, Edinburgh, Glasgow, &c., sounds very strange to those whose knowledge of divine things is confined within the Bible boards alone; yet the writings of John Lacy, and his school, contain many such, and James Cunningham has published a large collection of those directly given in communication to himself. These men lived more than a century ago. Lacy was a gentleman of property, worth £2,000 per annum, and evidently a simple-minded man, and quite free from the imputation of craft for gain. He had also the gift of tongues, and spoke Latin, when the Spirit was on him, with great fluency. It was not good Latin; but he could speak it at no other time.

Emanuel Swedenburg, and Richard Brothers, are well known apostles of mystery. The latter made considerable stir in his day. He was visited by the first nobility of the land; and the visit of the King's brother, the Duke of Gloucester, so alarmed Mr. Pitt, that, with the assistance of the Attorney and Solicitor-General (now Lords Eldon and Reddesdale) he got the Duke of Portland (Secretary of State), to arrest Brothers as a traitor, in 1794. He was kept in confinement eleven years, that is, till Pitt died, and then liberated immediately. And pray what reason have we to believe that the ancient prophets were different from Brothers? Their treatment was similar. It is imagination alone that makes the difference.

Since Brothers' time, we could enumerate many individuals of the same class; but it would swell this article to an unnecessary length. We shall, therefore, content ourselves with giving a specimen of a living prophet, the celebrated John Wroe, of Ashton-under-line notoriety, now, we believe, residing at Wakefield, in Yorkshire. Wroe is a singular man. With the good or evil of his character we have nothing to do. We are treating merely of mental phenomena, and to phenomena we confine ourselves. He has disciples in all parts of the country, in England, Scotland, and Ireland, and he has several missionaries preaching his faith. He even sent two missionaries to Vienna, many years ago, to anoint young Napoleon, as the next scourge of the Lord; but they could not obtain an interview, the Prince being hurriedly taken out of town, whence they could not follow him. This was interpreted as a sign, by some, that he was not the character meant. Wroe has given a strict law to his followers, to "bind the evil," as he himself says; and in many respects it is very effectual. Temperance is especially enforced, even the tasting of spirits used to be prohibited; tobacco was forbidden; cleanliness was enjoined, both in house and person; but a very narrow creed, and exclusive sectism is encouraged. That John Wroe has visions and revelations, we have no occasion to doubt. The visionary phenomena are too unique in their kind, for us to be deceived to any great extent; and an unlettered peasant, like Wroe, who cannot even write his own name in a legible style, and can write nothing more than his name; a man who scarcely ever read a book in his life, and, therefore, is entirely unacquainted with the history of his class, could never bring forth such a perfect imitation by mere craft. We could safely challenge the most learned and talented man in England to do so. Many of Wroe's communications are in print; the language is inaccurate, and full of provincialisms, but some of the ideas are exceedingly rich. We will extract one specimen only, almost at random. (To understand the commencement, we must observe, that when the Spirit came

upon him, he always put his hat upon his head, and took a rod of iron in his hand; if he could find no other substitute, he took the poker. We asked him once, how the Spirit came upon him—how he felt the influence? He said it sometimes seemed like the flapping of the wings of a large goose over his head. Sometimes it was merely an irresistible impulse, which overcame volition; sometimes an audible voice; sometimes vision. In vision he has been so insensible, that the pricking of needles and pins made no impression.

"Islington, London, 4th Month, 9th Day, 1829.

"The words of the Lord came unto me, saying, Yohanan (Hebrew for John), I will rule the whole house of Israel, and this shall be the sign to the house of Israel, that if Israel see the servant prophesy with the rod not in his hand, they shall pay no regard to that, neither shall they be ruled or directed by it. Whether it be male or female, they shall give account of all that has been transacted during the time that he has been their prisoner; if his head has been covered, and the rod in his hand, that shall they show to the house of Israel, and no other. * * *

And within the thousand years, which is one day, and the last of the six, and within it will I make the first (man), he shall be finished, and not be marred any more; for, within the third watch of the day will I make a final end, and every planet where man dwells will I draw out of its place; for where man dwells there will be a regular heat, and I will complete my work, every tree shall give its increase at its proper season, for there shall not be one month in the year but the fruit shall be seen hanging on the trees, neither shall ye have store-houses to lay up your fruit. If you go northward there it shall be. The children shall hand the fruit to the fathers; eastward the same, southward the same, and west the same; for every month will I water the earth with dews; one month shall not have more water than another. Every river shall overflow the lands with mist, and the resemblance must I bring on Benjamin's gate.* For, when I was making man, Satan came also and marred the man in the making, so the earth of the vessel I cast from me, that I might make another, and within six thousand years will I finish him; and I have preserved the soul of man by the angels and guards that I have set over him. Though Satan marred the shell, yet the soul that looked to me have I preserved. He has had power to toss the earth to and fro, and break the arm, and cut the leg, and wound the body, but the soul he shall not destroy, nor destroy the life of it; for those who are bound prisoners, their souls will I require at his hands after my Sabbath is over, and I will show the justice of my power before the angels and my creation, and I will show to Satan and his angels that man has served me while he has been bound. When I cast him out of heaven, then I promised to finish man within six thousand years, that he might show his power during this time with all those planets which fell with him; then shall the angels which shall minister on these planets see my justice and behold my power, for I divided every ball which I fixed in the midst of the heavens for the angels; and I said I will make man within six thousand years on these balls which fell with Satan from heaven, that he should mar the man in the making on those which fell. So it was not man that fell wilfully, but being made subject to the fall, that I might show my power. So I tell thee, and the whole house of Israel, that he has power over all the planets which he took for instruments to make war in heaven. So in the planets which fell not, are not the whole creation with the angels there happy? I tell thee, with the house of Israel, these are my heavens, with the throne of mine inheritance, so man being made subject to vanity, not willingly, and Satan being stronger than they, it was needful that I should overshadow a part of them, and make them prophets. Satan, by his power, has come forth with the same likeness, that he might make all my work void, and throw the truth to the ground. There has not been one generation, but I have sent prophets amongst them.

Hear, O Israel, I have now showed thee things which have not been showed to thee before, for I will open thine ears, and

thou shalt hear, I will open thine eyes, and give thee a heart to understand with, so that thou shalt know both the day and the hour that I will finish thee; for I will bless thee with the blessing of eternity, so that thou shalt become my sons, and know me in all things; for he who hearkeneth unto me, he shall be a branch of me; as I live, so shall he live. * * * The balls of the planets which fell will rejoice more than the balls of the planets which fell not; yet I tell thee, those which fell, shall see my justice, and give true judgment."

The above is a sort of mediocre specimen, neither best nor worst. If any one says he cannot understand it, we request him only to compare it to Hosea or Amos, or any one of the Jewish prophets.

But what is our own opinion of all this?

Our own opinion is, that authority resides in the universal church, and that prophecy through and by individuals is of no authority until received by the universal church. Were the Church to receive John Wroe, he would become authority. At present his authority is confined to his own followers.

POLITICAL DREAMERS.

We have often asserted, and still repeat, that politics are equally as mysterious as religion, and that the people are all at present under a political delusion. The whole system of government is a fallacy, and a tyranny. Taxation is injustice, and "*each man for himself*" is the mystery of iniquity. In this individualism lies all the evil. The mere laying on or taking off a tax will make very little difference, whilst individualism lasts. Things would soon come to their old level again. The world is, so far as the relative distinction between rich and poor is concerned, just in the same state in which it always was. Some think former times were better. They said so in Solomon's days; but Solomon replies, "Thou dost not think wisely concerning this thing." They say so of the weather: that the summers were hotter, and the winters colder. They used to say so a hundred years ago. They are always saying so, says Roach, in his "*Great Crisis*," in times of peace, for Nature conforms to the state of human society, and harder frosts are sent in time of war, and these hard frosts bring corresponding reactions of heat. This was said more than a hundred years ago, and the last great war-time is a somewhat curious confirmation of the assertion. If, therefore, the above writer concludes, a time of universal peace shall come, all the elements will be subdued, and play sweet concord with man's passions. It is a beautiful idea; but it is a digression from our subject, which is political delusion. Men have always been complaining, and always blaming *little trifles*. One says, taxes are too heavy; one says, rents too high. One blames paper money; another blames gold. One says provisions are too dear; another says too cheap. The whole breath of the people is spent on trifles, consequently they are just where they were. They have never yet struck at the root of the evil, viz., individualism, or the selfish system.

In order to give some positive proof of this fact, we shall quote a few passages from old writers, chiefly taken from Sir J. Sinclair's collection. We shall begin with a quotation from Jacob Vanderlint, who recommends the enclosing of commons, &c. This has been done, and still no good has followed. The following passage was written in reply to an objection, that food was too plenty, and that breaking up more land would only make matters worse. It is dated 1734;—

"If, therefore, it be not the plenty of the produce that is the cause that it is at present sold so cheap, that the farmers can pay no rent, as, I think, it is sufficiently proved it is not, it will be necessarily required to show what is the cause of so melancholy a truth as this objection is founded on. For I allow, that, perhaps, there never were so many farms quitted, and thrown on the gentlemen's hands, in England, as at this time.

"Now this cause, I assert, is chiefly, if not solely, owing to too great a scarcity of money amongst the people in general, and in order to improve this, I must show what are the signs of a sufficient plenty, and of too great a scarcity of money amongst the people.

* His own residence, near Ashton.

"Now the signs of a sufficient plenty of money are these: the houses well filled with inhabitants, the rents well paid for them, and fines exacted; as also, that the rents for lands in general be well and duly paid, and that we be not overburthened with poor, nor our roads or streets infested with highwaymen and robbers. When things are thus circumstanced, trade may be truly said to be in a flourishing state, or money, on which trade floats, may be said to be sufficiently plentiful, and more plentiful than this it never can be.

"On the other hand, since it is now notorious that the number of empty houses is very great, and, instead of fines for them, as formerly, the rents are lowered, and still falling; besides that the landlords very frequently fit them up, too, for the tenants, and our poor are so very much increased, that we are obliged to transport many of them, and our roads and streets are so exceedingly infested with highwaymen and robbers, as, perhaps, the like was never; and since the objection says the landlords can now hardly get any rents for their farms; these signs, therefore, being exactly the reverse of the former, must needs be as certain and evident proofs of a decay of trade, or, which is tantamount, of too great a scarcity of money amongst the people in general, as the aforementioned circumstances were signs and proofs of a flourishing trade, and a sufficient plenty of money amongst the people in general; nor do I know what kinds of proofs could be produced, or reasonably required besides, or stronger than these.

"For if, when the houses were well filled with inhabitants, the rents were not only well paid for them, but fines frequently exacted, and we were not then overburthened with poor, as we are now, nor our roads nor streets infested with highwaymen and robbers; if the rents for the lands were then, likewise, well paid, and raised too, as they certainly were; and if now the gentlemen can hardly get any rents for their lands, and all the contrary marks and signs are upon us, it must be plain that it is not the plenty of the produce, but too great a scarcity of money amongst the people, which hath reduced trade to so languishing a condition, that tradesmen in general can't get money to pay the usual rents for the houses, nor the farmers for the farms."

Anno 1680.—"It may be undeniably and uncomfortably observed, that whilst every one hath eagerly pursued his private interest, a kind of common consumption hath crawled upon us, since our land rents are generally much fallen, and our home commodities sunk from their late price and value; our poor are vastly increased, and the rest of the people generally more and more feel the want of money. This disease, having grown upon us in times of peace, when no foreigners have exhausted us by warlike depredations, may very justly amaze us; and the more, when at the same time we observe that some of our neighbouring nations, lately our equals, or much our inferiors (I mean the French and Dutch), are become so prodigiously rich and powerful on a sudden. Certainly these mighty productions must have some great and vigorous causes, which have been very furiously working of late years, and such as have not fallen under common observation."—*Britannia Langens; or, a Discourse of Trade*, Printed Anno 1680. Introduction, p. 1.

1699.—"Unless this can be compassed (namely, reducing the revenue of the crown to the sum of 2,300,000l. per annum), it will be found that, in no long course of time, we shall languish and decay every year, by steps easy enough to be perceived by such as consider of these matters. Our gold and silver will be carried off by degrees, rents will fall, the purchase of land will decrease, wool will sink in its price, our stock of shipping will be diminished, farm-houses will go to ruin, industry will decay, and we shall have upon us all the visible marks of a declining people."—*An Essay upon the probable methods of making a People Gainers in the Balance of Trade*. By Dr. D'EVENANT. Originally printed Anno 1699. See also his *Essay on the Balance of Power*, "I will venture to say, from the time of the Norman invasion we never had a more dismal view before us." Originally published Anno 1701; printed in his works vol. iii. p. 302.

1736.—"The vast load of debt under which the nation still

groans, is the true source of all those calamities and gloomy prospects of which we have so much reason to complain. To this has been owing that multiplicity of burthensome taxes, which have more than doubled the price of the common necessities of life within a few years past; and thereby distressed the poor labourer and manufacturer; disabled the farmer to pay his rent; and put even gentlemen of plentiful estates under the greatest difficulties to make a tolerable provision for their families. From this have proceeded those infinite swarms of locusts and caterpillars in office, who not only prey on the vitals of industry, but render even our liberties precarious, and dependent on the will of those, who have the sole nomination and direction of them. And to this we must likewise ascribe that ruinous spirit of luxury, corruption, and venality, which hath infected the whole nation, and almost effaced the very marks of frugality and public virtue amongst us."—*The Craftsman*, No. 502, 14th of February, 1736.

1739.—"What are then the circumstances of this kingdom and of France? On one side mortgaged revenues, credit sunk at home and abroad, an exhausted, dispirited, discontented people. On the other, a rich and popular government, strong in alliances, in reputation, in the confidence and affection of its subjects.—Our well-equipped fleets and well-dressed troops give, to be sure, an air of magnificence; but then it is well known that we owe almost Fifty Millions, and have been forced to apply the Sinking Fund, not to discharge that debt, but to furnish out these shows; whilst in most parts of England gentlemen's rents are so ill paid, and the weight of taxes lay so heavy upon them, that those who have nothing from the court can scarce support their families.—*Considerations upon the present State of our Affairs at Home and Abroad.—In a Letter from a Member of Parliament to a Friend in the Country*. By George Lord Lyttelton. See his Works, Edition 1774, vol. I. p. 64 and 65.

1736.—"It has been a general received notion, among political arithmeticians, that we may increase our national debt to One Hundred Millions; but they acknowledge that it must then cease, by the debtor becoming a bankrupt.—But it is very difficult to comprehend, if we do not stop at seventy-five millions, where we shall stop.—*A Journal of Eight Days' Journey, &c. in Letters*. By Samuel Hannay, Esq. Printed Anno 1736, in one volume quarto, p. 318.

1765.—"Thus much is indisputably certain that the present magnitude of our national incumbrances very far exceeds all calculations of commercial benefit, and is productive of the greatest inconveniences, by the enormous taxes that are raised upon the necessities of life, for the payment of the interest of the payment of this debt, &c. &c.—And lastly, they weaken the internal strength of a state, by anticipating those resources which should be reserved to defend it in case of necessity."—*Blackstone's Commentaries*. Vol. I. p. 328. Edition 1775.—See also Preliminary Discourse to Postlethwayte's Dictionary on the wretched state of our Finances. Third Edition, Anno 1766.

1774.—"I am grieved to observe, that we have many taxes more hurtful to individuals, than advantageous to the public revenue. Multiplied taxes on the necessities of life, candles, soap, leather, ale, salt, &c., raise the price of labour, and consequently of manufactures. If they shall have the effect to deprive us of foreign markets which we have reason to dread, Depopulation and poverty must ensue."—*Kaim's Sketches of the History of Man*. First Edition, vol. I. p. 484.

1776.—"I suppose there is no mathematical, still less an arithmetical demonstration, that the road to the Holy Land was not the road to Paradise, as there is, that the endless increase of National Debts is the direct road to National ruin. But having now completely reached that goal, it is needless at present to reflect on the past. It will be found in the present year 1776, that all the revenues of this island, North of Trent, and West of Reading, are mortgaged or anticipated for ever. Could the small remainder be in a worse condition were those provinces seized by Austria and Prussia? There is only this difference, that some event might happen in Europe which would oblige these great Monarchs to disgorge their acquisitions. But no imagination can figure a situation which will induce

our creditors to relinquish their claims, or the public to seize their revenues. So egregious indeed has been our folly, that we have even lost all title to compassion in the numberless calamities that are waiting us.—*Hume's History of England*. Vol. V. p. 475. Note B.

1776.—“Great Britain seems to support with ease a burden which half a century ago nobody believed her capable of supporting. Let us not, however, upon this account rashly conclude, that she is capable of supporting any burden; nor even be too confident that she could support, without great distress, a burden a little greater than what has been laid upon her.”—*An Enquiry into the Nature and Cause of the Wealth of Nations*. By Adam Smith, &c. Vol. II. p. 363.

INQUIRY INTO THE RELATION BETWEEN FAITH AND KNOWLEDGE.

ESSAY I.—THE KNOWLEDGE COMMON TO ALL.

By the Transcendentalist.

In the first place, let us inquire what is knowledge? We use the verb “to know” in two senses. Either we say, we *know* this or that; or we say, we know that this or that is so and so; as, for example, “I know Peter,” or “I know that Peter is an Englishman.” The first sense we will not dwell on, it merely expresses recognition.

The second sense may be called the scientific sense; all reading, all experimentalising, all speculation, are employed to acquire knowledge in the second sense of the word. The pursuer of science proceeds thus: he first takes a proposition, and then inquires into its truth. “A is B,” is a proposition of the truth of which he is not certain; at first he examines its demonstration if it be a matter of speculation, or weighs its evidence if it be an historical tradition, and finally declares that he *knows* it to be true or false.

We have now a middle state between knowledge and absolute ignorance, as we shall further explain. Suppose a man with a mathematical mind commences the study of Euclid's Elements, and proceeds as far as the fifteenth proposition,* which is as follows:—

“*Theorem*.—If two straight lines cut one another, the opposite angles shall be equal.”

Suppose he has read this proposition, that he understands its meaning, but that he has not yet read the demonstration, which proves its truth. He has a mathematical mind, by which is meant he does not admit the truth of the proposition on the mere authority of his author, but requires a rigid demonstration. What is called the middle state will be shown by a comparison between this man and another who never heard a single geometrical proposition. The student asks himself: “Are, or are not these angles equal?” The ignorant man never asks himself anything about the matter. Yet it cannot be said that the one *knows* more about the truth of the proposition than the other, for neither have read the demonstration. The student does not *believe* it to be true, because belief in an author is contrary to his disposition. All that he knows is the existence of a question of which the boor is not aware. If we suppose another who has read the demonstration, we shall have three classes.

| I. | II. | III. |
|--------------------------------------|--|--|
| Those who never heard of a question. | Those who know a question, but not the answer. | Those who know question and answer, whom we call the “men of science.” |

The supposition of a fourth person will split the second class into two divisions. This person will be one who has heard and understood the proposition, but having no inclination for geometrical studies, pursues the question no further. This man neither knows, nor ever will know, the answer, unless his mind be changed. Now, what is the difference between him and the student, since both are interrogated, that is, both have heard or

read the question? Undoubtedly, this is the difference; the student not only is asked, but *asks himself* the question, which the other never does. Intellectual education has done as much for one as the other; the tutor can never give more than what Toland (in his “Christianity not Mysterious”) aptly calls the “means of information,” unless, indeed, the answer is so very obvious, that the mere hearing of it will convey its meaning. Wherever there is the slightest difficulty, a question must be put by the pupil to himself, which, of course requires an exertion on his part.

We have now four classes, to whom, for brevity's sake, we will give the characteristic names of

| I. | II. | III. | IV. |
|-----------------|----------------------------|---------------|-------------|
| The uneducated. | The educated non-enquirer. | The enquirer. | The knower. |

Now these men, it is assumed, have all one quality in common; they have all sound minds, and none of them are idiots. They all, therefore, are aware that a thing must come under a category, or under the opposite of that category; or, to use a formula, they are all aware that A is either B, or it is not B. Where they got this knowledge, is not at present the question; we are not discussing the differences between Empirists, Platonists, and Transcendentalists, and assume as a fact, that every man, who is in a sound state of mind, will at once admit that A is either B, or not B.

For this formula may be put with a narrower signification, viz., “It is either true or false that A is B,” or even more generally, “A proposition is either true or false.”

This is a proposition which does not belong to any of the sciences, commonly so called, but which must be assumed, prior to the study of them. The whole body of scientific books do no more than give a number of propositions, and then determine to which of these two categories each proposition belongs. Not a step can be made, except from this point; no knowledge can be scientifically acquired, without a question being asked, and the asking of a question assumes the two categories.

We have gained a point from this portion of our investigation; namely, that in scientific knowledge we descend from the absolute to the concrete, and that this distribution of propositions, into true and false, far from being a part of any particular knowledge, is at the foundation of all.

True and false may be called the material qualitative division of propositions, in contradistinction to affirmative and negative, which are the formal division. Indeed, the use of affirmative and negative propositions would be extremely limited, if this axiom, or undemonstrated truth, did not lie at the basis of logic.

We observed, that the axiom, “It is true or false that A is B,” had a narrower signification than “A is either B, or not B.” Its narrowness consists in its not involving a non-B. The deficiency is supplied by another axiom:—“If it be false that A is B, it is true that A is not B,” and *vice versa*. The first axiom pronounces that there are two categories, the true or the false; the second, that the non-being of a proposition under the one, implies a being under the other. Whether these axioms are the highest logical heaven we will not say, but they are quite high enough for our purpose.

Understand, gentle readers, that when the word “high” is used, it does not mean “superior,” or “better.” These high axioms are mere abstractions, and would have no existence at all, were they not manifested in the concretions which are called “lower.” We find them occupy a necessary place in logic, that they have a kind of *logical being*, and therefore treat them with due respect, but merely on account of the service they perform in explaining what stands below. There are a number of sublime Platonic souls, who boast of the contemplation of such abstractions, which are called “Universals.” This, however, is but a sort of philosophical “Cockinism,” or a seeking to aspire, which ends in self-annihilation. The

* This proposition is selected as being one of the simplest.
T.

* The word “question” is used, because every mathematical theorem, till demonstrated, is no more than a question, though its form is enunciative.—T.

universal, apart from the particular, is a mere abstraction; the particular, without the universal, is a downright impossibility. The whole end of philosophy is to discover the universal, as manifested in the particular, always allowing the universal a primary and a logical being, which first comes into *existence* in the shape of the particular.

This subject is so interesting, that I shall pursue it for some time, and consequently shall interrupt my dialogues. Interrupt, did I say? I am not sure of that. The grand tendency of my dialogues was to show that each member of a relation, taken by itself, is a mere abstraction, and these essays will, I fancy, come to no other end. In one sense of the word I may be called "bipolar;" but my bipolarity differs from that of many others, inasmuch as I treat more of the point of union between the two poles, of that which is neither non-A nor A, but non-A in a state of becoming A. Thus, by the flowing, as it were, of one pole into another, instead of a sharp line of demarcation being drawn to separate them, I show that the high Being, who is above both poles, is not a mere logical abstraction, but a perpetually manifested existence.

I will just give the point to which my dialogues had arrived, that when I resume them, my readers may know how to take them up. I had come to a "striving," as the only state in which activity could be manifested. From this I had intended to deduce time and space as being naturally generated by a struggling power, and what I said in refutation of Zeno's theory, was to oppose any objection which might be made to the possibility of generating time, on the assumption that an infinite number of points must be passed through.

PATIENT READERS,—who have taken the trouble to peruse the dialogues, read these essays also; if the first were to your mind, so likewise will be the second.—Your loving friend,

THE TRANSCENDENTALIST.

A DIVINE NATURE THE PRIMARY CONDITION OF SOCIAL IMPROVEMENT.

In the present pre-occupied state of society, when nothing but bustle and activity prevails, it may not be impracticable to inquire, why the arrangements for social improvements, long since proposed by benevolent individuals, and continually brought before the attention of "*the people*," have never yet been adopted? or why *the people* themselves have never listened to the schemes so ably designed for them, with an intention to put them into practice.

Is it that the people are satisfied with the objects that they are at present pursuing? or is it that they are not enough dissatisfied with themselves to desire a personal reform? Or shall we say that *the people* have never been in the position to raise funds sufficient to make the experiment.

We think that the savings' banks, friendly union societies, and clubs of various descriptions, by which money to an immense amount has been collected, is a sufficient evidence, that *the people* could, if they would, have secured clean abodes, wholesome food, instruction for themselves, and their children, at a less money cost than the cost of their present miserable condition.

Why, then, we again ask, have the people not adopted improved social arrangements? And we propose, as an answer, that their pre-occupations are so intense, and their individual pursuits so imperative, as to prevent their feeling the immediate destitution in which they are, which consequently precludes the possibility of seeking an efficient remedy; or that the people are too strongly attached to the low objects of their present aim to leave them for that which alone can essentially improve them.

If we carefully examine the end proposed by philanthropists, we think, we shall find that a *severe self imposed* moral discipline is the price demanded for improved social conditions.

It does not rest with us to determine whether the price is too high for the promised advantages, to be secured to us, and to our children, but to ask whether the people are willing to pay it.

If it is allowed that the people are not yet in a state seriously to attend to the good proposed to them, we may ask is it *possible* for them to be brought to listen to the new plans for their improvement, and secondly how is this listening state to be awakened in them?

In attempting to show that the people are not in a state to accept an improved manner of life (or mode of living), we have simply to ask, what are the conditions prescribed for them by the philanthropist, and we shall find that the requisite state to receive wholesome food, clean abodes, orderly habits, scientific arrangements, and other social enjoyments are a love of, and desire for temperance, chastity, order, science, music, &c. &c.

But as these conditions are so generally wanting, where is the stock of goodness from whence the new community is to have its beginning?

Let us, however, suppose that social arrangement are forming which shall be in harmony with the wants of the people, and that they are imperceptibly advancing towards the end proposed, and inquire what *must* be the necessary consequence (and if we take a correct view), we shall find that every improver from Plato down to Fourier and Owen, stands merely as an individual example of the divine and human conjunction, or instance of peculiar genius, and that in almost every age has arisen some such genius *in real being*, so far in advance of the general mass; who seeing heights, lengths, and depths, beyond the people, has always some scheme to offer for the general good, which is more pure, more true, and more real, than the people are prepared to believe, or to practice. Such a genius points to the higher and true way, and it were well for the people if they followed the direction; but being tied and bound by the chains of their prejudices, and occupations, they have no mind left for a like association. Probably, such men will continue to appear, who are fraught with celestial blessings, to allure the people from their gloomy drudgery, striving to get in them, an upward tendency, that richer blessings still might unfold themselves, should there be found people worthy of them; and although some few in all ages have accepted the superior attractions, the people *collectively* have never yet been in a state to receive the same. And thus it appears that it is not possible to bring the people into a state to accept the generic guidance of individual genius, unless a higher nature than the more human is superinduced into them.

Shall we then give, all hopes of ever seeing the human passion submitting to be governed by the divine spirit, because we presume that we have proved that the work so intensely desired by Philanthropists, can never be brought into light, or active energy, by *their own efforts*?

We know that the Infinite Spirit in the philanthropist is always working a new character into the age, superior to the present character of the people, and ever will be superior to the views *generally* conceived, in every stage of exterior civilization. In other words, that, as the physical body, is always in arrear of moral beauty, so are the external forms of society always in arrear of the ideas originated by the spirit, and must ever be so, inasmuch, as the effect is lower than the cause, the act inferior to the actor.

Hence we may venture to assert that the present social state is the expression of the present *voluntary* state, with respect to the spirit; and that *if it were possible* to change the social form, it would soon assume a confused, and more unnatural appearance, than it does at present, and disorder greater than such as we now suffer from would be the result; but in truth, the forms and the tastes cannot long materially differ.

Or, to say the least, would not a superior scientific culture produce increased want and misery, as long as it was not used to amend those passions, which the spirit seeks to substantiate to sustain properly the whole outward activities.

Is it not for this, that Jesus Christ always avoided to recommend formal doctrine? did he not perceive, with much more intense force than we do, that a *new well being* was needed, and not new outward circumstances, and that good conditions would as naturally result from the good in the moral being, as expressing result from, and must take the form prescribed

to it by the will, in the intellect, that the good in the characters will soon produce good beings, and good circumstances.

The will, when free, rejects all forms not in accordance with that which makes it free.

The people progress just in proportion as their character is in relation with the improving spirit.

Instead, therefore, of giving up as hopeless the government of the passions, shall we not endeavour to show how man can receive the new nature, that will govern the old, and out of the old conditions, make the new that are suitable.

SHELEMIAH.

SOCIAL IMPROVEMENT—THE PRIMARY CONDITION OF INDIVIDUAL IMPROVEMENT.

OUR readers will perceive from Shelemiah's letter that we have a host of opponents upon us attempting to prove that it is necessary to be good and comfortable inwardly before you can be so outwardly, that you must go to rest first, and make your bed afterwards. Our own idea is, that it is necessary first to anticipate by imagination, and prepare by mechanical skill a place for sleeping comfortably, and after that to go to bed. As to morality, in a state of society like this, it is delusion to think of it. We do not consider temperance or chastity all that is necessary; we know many rogues who are notable for both virtues. Most of the happiness or unhappiness of life depends upon what is called temper; and all the world knows that temper is best managed by outward circumstances. If the acid of apples set your teeth on edge, do not eat apples. Is not this the lesson of wisdom? Does not Shelemiah teach this himself when he recommends moral conduct? What is moral influence but an outward circumstance acting inwardly? "Oh, but," says Shelemiah, "a man must be sober inwardly before he is sober outwardly!" Indeed! this is a great discovery! We allow it—he has got the resolution to be sober. But how did he find out that sobriety was a virtue? Because a certain material substance deranged his immaterial intellect. Had this not been an outward fact, he never would have known what sobriety was. The people, we do allow, can, if they please, become sober. They may cease to drink spirits or beer; they may learn to live upon bread and water, but they can never learn to obtain good wages for labour by this virtuous process. The question thus divides itself into two, and we hope Shelemiah will attend to it—*first*, what the people can do; and, *second*, what they can not do.

Shelemiah would do well to consider the effect of such an assertion as this:—"The present social state is the expression of the present voluntary state." He infers from it that if the present formal state were changed, society would fall back into its old confusion—i. e., if a poor man, in a dirty house and clothing, were to receive a fortune, he would soon fall back into the dirty house and clothing. No! the poor man would receive a new voluntary feeling instantaneously with the money. In a moment, in the twinkling of an eye, it would come. He would retain much of the old man; but new tastes, hitherto suppressed, would begin to germinate and grow according to the capacity of the individual to receive them. Who does not know this? We sketch from Nature.

If this poor man were previously a drunkard his fortune might ruin him. "Hear, hear," says Shelemiah. This we consider the only rational objection, and if we could not provide against it, we would instantly allow, that before we can produce a good moral state we must make men sober. But nothing is so easily cured as drunkenness. If we can find no other means, we can withhold the material. You cannot prevent murder thus—you cannot make men kind and affable thus—you cannot regulate the sexual passions thus—all these must be under moral training—but drunkenness is the offspring of distillation, and lack of entertainment. If there were no gin, there would be no gin drinking. But we maintain that moral training would cure drunkenness, and moral training is an outward process.

Shelemiah has fallen into the vulgar Christian notion, that Jesus Christ taught no new plan, therefore no new plan is necessary; but Shelemiah should remember that Jesus Christ

maintained that the world would get worse and worse, and that his no-plan of regeneration would be inefficient. Experience has confirmed this. We can expect no greater individual attempts at holy and virtuous living than have already been made, to the great sorrow of society, for individual proselytism is always destructive of general peace. Time and experience have stamped "impossible" upon the scheme of reforming man thus. Modern times have suggested a new process, viz., a universal process—the reformation of society *en masse*. This alone has not been attempted. It is a new idea to the people. The great mass of the people have never heard of it, or heard of it only through the ridicule and satire of the public press, which represents every thing as a chimera that is not urged upon it by a pressure from without. About ten years ago the ballot was a delusion all over the press, now one half of the press is calling for it. It rose from the people, and is now spreading over society. There are many other notions now rising which a few years will bring to maturity and vigour.

If Shelemiah read Jesus Christ as he ought, he would find the Saviour say, "Come unto me;" and, "If the son of man be lifted up, he will draw all men unto him;" and how are they to come? "Inwardly and individually," says Shelemiah. Why, that is the very way they have preferred for eighteen hundred years. We have all our lives been sickened with it. All our friends, and relations, and acquaintances in youth, all the pulpit orators we were accustomed to hear, all told us to seek Christ inwardly and individually. All the Christian fathers are full of this mode of coming to Christ. But scarce a syllable can we find in one of them about reforming man *en masse* upon Christian principles. We maintain that Shelemiah's method has been tried, and tried, and tried a thousand times over and over, and demonstrated to be impossible. Moreover, we maintain that it is Antichrist, the very spirit that cannot come to Christ, because its essence is division or individualism, it begins with parts, and never can embrace the whole. It is an *a posteriori* process. Ours is *a priori*, beginning with the whole, and embracing all at once.

That the good must be in the framers of a good constitution we allow, but it is not necessary for the people to be more than passive to it. We thus acknowledge the spiritual to be the root and the branch, the beginning and the end.

DEVILISH LOVE.

SPECIAL attachments are not inconsistent with social love, but we are sorry to say that they are frequently experienced, in the very strongest and most feverish degree, by the most unworthy persons, and have their root in the basest selfishness. *Devils can love*, but they love *selfishly*. It is *angels* only that can smile on all, while they dont on one. Where are they? We have seen mothers, whose love to their own offspring was so selfishly intense, that they looked with jealousy and hatred on every other child. We have seen lovers, whose attachment was so strong, that they were unhappy in each other's absence, and manifested their unhappiness by rudeness and incivility to all around them. We have even been disgusted with the hatefulness of mutual love; but it was *self love*, unsanctified by *social love*. Self love is not an evil in itself. It is only evil when confined to mere self, or one's own little coterie. It is the wild root of virtue. It is the radicle of the seed—social love is the plumula.

As twigs, ungrateful to the planter's care,
On savage stocks engrafted learn to bear;
So different virtues do from vines shoot,
Wild Nature's vigour working at the root.

TO CORRESPONDENTS.

A Constant Reader.—We do not know, and do not care much. Transcendentalist.—As T. is now writing for us, and not for "the salt of the earth," we hope he will make his letters as simple and morally useful as possible.
I. G.'s errata in our next.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 27, Vol. III.]

SATURDAY, DECEMBER 30, 1837.

[PRICE 1½d.]

TO THE OWENITES.—SOCIAL REFORM.

SOCIALISTS.—The subject of this address is the "Religion of the New Moral World," read by us long ago in your weekly periodical, but lately put into our hands by your worthy Father, in the shape of a bill or tract. If it be a mere formal production, it ought not to be circulated: if not a mere form, but an everlasting truth, it is a subject of very great importance.

To us the subject of religion is of very great interest. There is none of greater. There are two reasons for this—first, a personal reason, which we pass over as an individuality, a feeling which we cannot well communicate, or make intelligible to those who have it not; second, a social reason, because it seems to belong to human nature, and is cultivated, under various aspects, by the great majority of mankind, the wisest and the best.

It is, therefore, a powerful circumstance, and we have no doubt has hitherto been found such by you, in your strugglings for social amelioration.

Religion has hitherto proved a very great curse to society. Many, therefore, are tempted to conclude, that it is a curse in itself, under every aspect; but has not wealth proved a curse? has not intellect proved a curse? Every lever of power has been abused in the old immoral world. The argument of a curse, therefore, is not conclusive for the entire removal of religion.

But what is religion? Is it a mere matter of expediency only, or is it the fountain of all true philosophy, and all sound morality. St. Paul says of his religion, "In Christ are hid all the treasures of wisdom and knowledge." A true religion is the foundation of all truth. It is the Atlas, which supports the intellectual and moral being.

We have given your religion, in another part of the *Shepherd*. We do not mean to oppose a single article of it. In general, we think it very excellent, and unexceptionable in so far as mere form of expression is concerned, and feel disposed to wink at any trifling imperfection, which might suggest itself to our own peculiar and individual views. We do not regard ourselves as authority, and, therefore, cannot presume to be hypercritical; but there is one immense vacuity not filled up, which is of so universal a nature in Christendom, or, indeed, any where else, that we are confident we are not speaking as individuals when we make allusion to it. It is this very universality that emboldens us to address you. We mean to speak the sentiments of millions of the wise and the good, the rich and the poor, the learned and the unlearned, the young and the old, of both sexes.

Well, then, we say, that a system, which acknowledges the being of a God, whether matter or spirit, for we cannot say much that is definite or intelligible about the nature of either, cannot be called a religion, unless it recognizes the Providence of God in the works of creation. God being omnipresent and omnipotent, is omni-active at the same time. He has, therefore, been actively engaged in every event or occurrence which has taken place in society.

Being the sole source of the laws of Nature, he is the sole source of wisdom. Having the power to manifest that wisdom,

all his works must end in wisdom, and all the means employed to effect his ends must be the inspirations of wisdom.]

According to the Religion of the New Moral World, he has resolved to consummate the progress of society in a system of universal justice. The process, therefore, by which he has resolved to lead men to this consummation, must be a process of wisdom. The apple is sour before it is sweet, it is green before it is clothed with its roush colouring. All growth is gradual, and all maturity the offspring of incipient weakness.

Thus it is with man. Thus it is with human society. But the Deity is not to be acknowledged in the ripe fruit only, but in the unripe also; not in the summer only, but in the winter, also,

Awful he,
With clouds, and storms, around him thrown,
Majestic darkness!

The acknowledgment of the directing counsel of God in all things is not an article of faith only, but an axiom of philosophy. To bring in the Deity, therefore, in a vague and inactive sense, like the Epicureans of old, without giving him an active office to fulfil in the government of his own creation, is perfectly superfluous. Atheism would be as philosophically correct. If the world can do one hour without God, it may do for ever.

It is a philosophical, we may call it a scientific fact, that God is the Governor of the world; that its revolutions have been directed by him, and its institutions appointed by him; and that they form a great and unique system for the formation of human character; that such men, therefore, as Moses and Christ are, in an especial sense, divine commissioners, not because they wrought miracles, but because they formed men's characters.

To deny, therefore, the divine mission of such characters, is an error in philosophy. It is a departure from that very reason which you claim as your especial guide.

Nor does the acknowledgment of the divine mission of Moses and Christ imply the continuance of any system established under their name. The process of human discipline is a succession of stages for the development of different features of humanity. One gives place to another; and though all do walk in darkness, the last was foreseen and foreshown in the first. From the very commencement of the great mystery of religion, it has been predicted, in dark and mysterious language, that a time should come, when righteousness would flow down our streets like waters, and the poor should be satisfied with bread; and during the continuance of these preparatory and transient systems, however dark and ambiguous the style, this positive truth has always been announced, that they were not final systems, but temporary corruptions, for the manifestation of evil—heralds of a better and a more enduring system to come. The very reception of the faith of these systems is the strongest impulse for bringing them to a close.

Now we do not treat this subject as your Christian-evidence gentlemen treat it, by quoting from the fathers and the historians; we deal neither in history nor fable, Greek, Latin, nor Hebrew. Such reasoning is mystification to the poor and

the unlearned, and is not necessary with the people. For, to make the argument complete, if you quote from one father, you must quote from all, and you must give text and context also; and when you have quoted them, you must then find out from whom the fathers themselves did quote, and you lose yourselves in a cloud of witnesses, and make out a case so long, that both jury and counsel are puzzled to connect its innumerable links. We reason from mere facts—the present existence of Christianity, as the successor of Judaism, and the prediction, in both these religions, of the very religion you wish to establish. They have been predicting your coming for thousands of years. The mode of prediction we overlook; the general fact of the announcement of a new era, a new earth, wherein dwelleth righteousness, is all we assert.

What objection, therefore, can you have to acknowledge the faith of these two systems? Do they throw any obstacle in your way? They predict their own downfall for your sake—their own absorption, by your universal system of peace. Do you imagine that the corruptions of priesthood would receive confirmation from an acknowledgment of the divine mission of the churches? Must an apple always be green, and a gooseberry always sour? or do you imagine you would lose your liberty by such an acknowledgment? You would gain it, and you would gain authority. What is the authority promised to the Church, that is, the company of those who are gathered together upon the principle of Christian charity? "the keys of heaven and earth." "Whatsoever ye bind on earth, shall be bound in heaven; and whatsoever ye loose on earth, shall be loosed in heaven." Ye are under no law, "for love is the fulfilling of the law." Say we not right, therefore, that you will, gain your liberty? You become the representatives of Christ, and act in his name; and to him all authority is given, and no earthly power can deprive him of it.

But, then, you say this is an imagination. We reply, your religion is an imagination, there is not an article in it which is less imaginative than this we have taught. Do you want certainty? Have you got it in your own system? You foresee a system of peace; it is a plausible hypothesis. You teach a doctrine of the formation of character; it is a beautiful theory, but your practice has not yet substantiated it. You inculcate the doctrine of non-responsibility, but still it is problematical whether you can ever act up to it. You are pretty well acquainted with imagination, and deeply conversant with fanciful doctrines like ourselves. They who live in glass-houses should not throw stones. Moreover, you teach phrenology sometimes, and you divide the mind, the indivisible consciousness, into faculties, and you sometimes say that one faculty sleeps whilst another is awake, like the eyes of Argus when he watched his flock. You give instructions in geology, and you tell us what the earth was thousands of years ago, and what climate this island was placed in, and how the poles of the earth must have altered, although you know not but this island is a moon that fell into the ocean when Noah was on his voyage to Mount Ararat. All these things you take upon credit, and we do not blame you, they are good things, and useful knowledge; but still they are largely mixed up with faith and imagination, and not a whit more certain than the fact we have presented before you.

Do you want to get rid of mystery, therefore, shake it off, and cast it from you. Here is a science with a beginning, a middle, and an end. Why do you reject it? why do you prefer a state of darkness to one of light? why do you require more certainty on a point of this nature than on any thing else? why do you believe in an unmeaning hypothesis, and reject a plausible and definite hypothesis, because it is not yet certified with sensible demonstration? Are you always so very prudent in judging? Is your inactive unprovidential God more intelligible, or less hypothetical than the one we have now described. Is there any superstition in ours which does not belong to yours? and is not yours somewhat useless and ridiculous, sitting omnipresent in Almighty indolence, letting everything go to confusion as it may; whilst ours is an ingenious intelligent power, leading us through the wilderness of confusion into the haven of eternal justice, guiding our steps as a father doth his children, and saying unto us, in a still small

voice of faith, "Fear not, I am with you." Ours is a better philosophy. It is more true, more rational, more cheering, more inspiring, more free, for our Father has told us, that when we come of age he will remove the devil, our tutor, and give us our liberty.

Talk about mystery! where is there greater mystery than in your own minds! Have you not clothed all things in obscurity except politics, which we give you credit for reforming? You have given us a new earth in politics, why not adopt the new heaven in religion? You say you have got charity. This is not enough. Moreover, it cannot be complete if your philosophy be based on an erroneous principle, which kills faith and hope, the sisters of charity. Faith is charity in prospect, and hope is the same. You say your system is Christianity realized. Why deny, then, the mission of Christ, and his faith? Do you not kill your own system thus, and diminish its authority by casting off the Christian philosophy, whilst you keep its moral spirit? What harm does the philosophy do you, that you fear it so much? What conjuror has alarmed you, by raising the devil in the one, and not in the other? Let us know, for truth's sake let us know, and let us discuss the subject in a friendly way for a little in the *Shepherd*, and the *New Moral World*. We do not know what good may result from it. Truth can never suffer. It is a universal question, and your success is deeply involved in it. Mayhap we can show you something you do not know. You cannot excuse yourselves now by saying you do not wish to enter into religious controversy, for you are deeply involved in it, and yet you are not touching the question, for when you prove every miracle of the Bible a falsehood, you gain nothing at all. The Catholic Church rests on a higher authority than mere Scripture or miracle, so that you have a tough battle to fight, even when you are done with the Protestants, and there are many giants to overcome before you begin your second campaign. You may save yourselves a great deal of trouble. You may appropriate the learning of the Church, just as you appropriate the wealth of the rich, and the taste of the great. You will act in consistency with your principles in so doing. But you have a poor prospect before you if you engage in historical controversy about miracles, and the external evidences of religion, which, if the Church had a mind to enter seriously into the conflict, it could pour down in water spouts and inundations upon you.

But why you want to get rid of miracles is more than we can understand. You say your system is Christianity realized. Why are you ashamed of the interposition of heaven in its favour? Do you think it the bastard son, the son of the bondwoman, and want to lower the legitimate to your own level? or what do you mean? Surely it is an honour to your system to know, that when it was first taught by Christ, it was ushered in by a power divine. We know no party more interested than you are in defending the miracles of Christ, and the constitution, and divine authority, of his Church.

But you say they are unnatural! You know this no doubt! This is a fact! O socialists, foolish socialists, Satan hath bewitched you!

But are we not as great fools as you are? quite so. We would weigh much about the same in a pair of scales. We have done, said, and written, many foolish things, attempted things beyond us, waded out of our depth, left unfinished many presumptive attempts. But in this address we are not speaking for ourselves, we are speaking for Christendom. The great majority of enlightened Christians would acknowledge the above truths. Fanatics, of course, would complain, but these you do not care for.

You must have your system universalized, and if you cannot imbibe some such principle as this, the consequence will be that it will be imbibed by some other party. It cannot be put down by reason, nor philosophy, nor matter-of-fact, nor common sense. We cannot imagine any thing sober and intelligent that can scratch the cuticle of such a perfect philosophy, on which the most sublime conceptions, the most poetical superstructure of feeling, can be raised in perfect unison with the perfection of moral and religious liberty.

We propose, therefore, the addition of the following article to your new religion:—

"That the dispensations of Providence in the history of mankind, constitute a connected series of training for the formation of human character, ending in the establishment of a system of universal justice, foreseen and foreshown in mysterious language by divine commissioners from the beginning in all ages, but, more especially by Moses and Christ, whose successive systems, instituted by an extraordinary manifestation of power, have afforded all the experience necessary to enable mankind to reconstitute society upon equitable principles, and unite the Gentile and the Jew in one great family."

This article contains vitality. There is a science in it. It does not meddle with the social system. We do not mean to interfere with outward arrangements. We may talk or chat a little about better and worse, and give various views; but this is our plan—to Christianize the social system, or to sanctify it; to consecrate it to God, to faith, hope, and charity. This is our object, our only object. This is all our ambition. We are merely a disembodied spirit seeking a body, hovering over the surface of the waters, like Noah's dove, and looking for a place of rest.

We recommend the Owenites to study this article well, and discuss it, and take time to it; but, more especially, we invite the editor of the *New Moral World*, or any of his talented correspondents, to discuss the matter with us in the two periodicals, for the mutual good of all. It cannot divert the attention from other proceedings, being purely internal and social.

RELIGION OF THE NEW MORAL WORLD.

The Religion of the New Moral World, consists in the unceasing practice of promoting the happiness of every man, woman, and child, to the greatest extent in our power, without regard to their class, sect, party, country or colour.

And this religion every child born in the New Moral World will be taught to practise from its birth, through life: and every one will easily acquire, and act upon, it.

Human knowledge is not sufficiently advanced to enable the children of the New Moral World to express more than probable conjectures respecting the supreme power of the universe; conjectures derived from the known laws of Nature.

From these laws the following conjectures are deduced as probable truths:—

- 1st. That an eternal uncaused existence has ever filled the universe, and is, therefore, omnipresent.
- 2nd. That this eternal, uncaused, omnipresent existence possesses attributes to govern the universe as it is governed.
- 3rd. That these attributes, being eternal and infinite, are powers which are incomprehensible to man.
- 4th. That these eternal and infinite attributes are probably, those laws of Nature, by which, at all times, in all places, the operations of the universe are incessantly continued.
- 5th. That it is of no importance whether men call this eternal, uncaused, omnipresent existence, MATTER OR SPIRIT; because such names alter nothing, explain nothing; and man knows the qualities of those existences around him, only so far as his senses have been made to perceive them.
- 6th. That if this power had desired to make the nature of its existence known to man, it would have enabled him to comprehend it without misery or doubt.
- 7th. That, as this knowledge has not been given to, or acquired by man, it is not essential to his well-being or happiness.
- 8th. That human nature has been formed to be what it is by this power; and the object of man's existence is the attainment of happiness.
- 9th. That the power which composes and recomposes all forms from the materials of nature cannot be changed in its eternal course by the request or prayer of man, or any created being.
- 10th. That all dissensions among men, on these mere speculative matters, are the greatest mistakes they have ever made, and are now the most formidable obstacles to their progressive improvement and attainment of happiness.
- 11th. That, for the convenience of discourse, it is necessary

that some concise term should be adopted, by which to designate that Power, which unceasingly composes, decomposes, and recomposes, all forms of existences throughout the universe: and that, the term God is, perhaps, as unexceptionable for this purpose as any that can be employed, because it has the recommendation of general use in its favour.

12th. That, therefore, the creating power, or powers of Nature, will be universally called God in the New Moral World.

The whole duty of man to this power, or these powers, is to be happy himself, to make his fellow beings happy, and to endeavour to make the existence of all formed to feel pleasure and pain, as delightful as his knowledge and power, and their nature, will admit.

There will, therefore, be no worship—no forms and ceremonies—no temples—no prayers—no gloom—no mortification of the flesh or spirit—no anger on account of religious differences—no persecutions,—but friendship, and kindness, and charity for the Jew and Gentile. All that will be required by man for the glory of God, will be to make himself, and all other living things, as happy as possible.

In the New Moral World, to produce happiness will thus be the only religion of man; and the worship of God will consist in the practice of useful industry, in the acquisition of knowledge, in uniformly speaking truth, and in the expression of the joyous feelings, which a life in accordance with nature and truth will be sure to produce.

Thus will a religion be established which will offend no man, be adopted first by the intelligent and rational of all sects in all countries, and afterwards by the human race, when it shall become one nation and one people, having one language and one interest, and when truth, or the knowledge of nature, shall cover the earth as the waters cover the sea.

THE POPULATION SCARECROW.

MALTHUS has devoted a chapter in his celebrated work on population, to the refutation of Godwin's Social System of Political Equality and Community. His principal argument is, the increase of population beyond the means of subsistence; and he draws a very striking picture of the progress of this *beau-ideal* system of Godwinism, until, by the operation of "the inevitable laws of Nature alone, and not from any original depravity of man, it degenerates into a society constructed upon a plan not essentially different from that which prevails in every known state at present." He says, that were such a state of society instituted, there would not be one woman in a hundred, of twenty-three years of age, who had not a family. Now we dispute this *in toto*. There are stronger causes than the fear of provision for a family, which prevent women from having families. What is it that causes so much celibacy amongst the aristocracy? What is it that causes such paucity of children amongst women of intellectual pursuits, and highly gifted minds? Only open up a field of honourable, intellectual employment for the female sex, and you would see a phalanx of women, as numerous as that which now pines in solitude, eagerly and enthusiastically engaged in useful pursuits, from whom the population terrorist would have little to fear. Campanella has got some views upon this subject, of considerable importance, which have been employed by no modern Socialist, that we know of, except M. Fourier. He says that Nature has created barren women, on purpose to prevent this evil; that they hold a very important station in the great household economy of Providence, a station similar to that of Female Communes at present. But theory, upon such a subject, is vain. We know not the resources of Nature, until we try the experiment, and the experiment must and will be made. We certainly must allow that if the present system of education prevailed, and all fear of having a family were removed, population would either rapidly increase, or mortality would increase, to keep it down. But there are some fears, which are better than others: some of a higher, and some of a lower order—the fear of mere want is, we believe, the least common of all preventives of population. Moral causes are most common. These latter operate on all the educated classes. There would be a positive decrease

of population, if the ratio for the higher classes were universal. The increase comes all from the uneducated. A prolific lady is a rarity. Our late Queen Charlotte, no doubt, was an exception; but she never was accused of blue-stockings. Zuccherò, the painter, could not get his picture of the Royal family finished, so rapid was the succession of baby after baby, to be introduced into the group. The poor artist, in despair, exclaimed, "Mein Gott, mein Gott!" and threw down his pencil. But *fine* ladies are not all Queen Charlottes. A baby is a rarity with the largest proportion. But they are neither to be praised nor blamed for this. It is not a test of merit or demerit. We state it merely as a fact, and an important fact, too, which Sadler, in his reply to Malthus, has, we think, demonstrated, that well-educated people are less prolific than those whose intellectual natures are not highly cultivated.

At all events, it must be very evident, that the argument of Malthus against a change of system is merely theoretical; and as it is his principal, if not his only objection, it amounts to nothing, until we have positive experience to ascertain its value.

We have the universal testimony of all ages and nations, to the hope of a change of system. Jew, Christian, Pagan, all agree in anticipating a period when a new law will be delivered to mankind, and a new order of things established. The return of the golden age is the song of all the poets, and is, more or less, incorporated with all religions; and, above all, with that religion of which Mr. Malthus himself was an ordained minister. The possibility of the new order, therefore, ought not to be opposed by a Christian clergyman. There must be provision somewhere, in the divine resources, for that system of things foretold, when God will "clothe the priest with salvation, and satisfy the poor with bread." It is not to be supposed, that any new laws of Nature will be enacted, but only opportunity afforded for the development of those laws which have hitherto been suppressed. It is remarkable, that an infidel should have more faith in the promise to the FATHERS, than even a Christian clergyman!

The world itself is not likely to last for ever. Why should not mankind have a thousand years' experiment of community, before it be destroyed?

OWENIAN TRACT.

THE following is one of the tracts circulated by the followers of Robert Owen, which we have selected in order to give our readers an idea of the present prospects of the party, as well as their mode of address.

OBSERVATIONS Upon Political and Social Reform, with a Sketch of the Various and Conflicting Theories of Modern Political Economists.

TO WORKING MEN AND WEALTH PRODUCERS OF EVERY CLASS.

FRIENDS,—You are the source and origin of all wealth; your hardy hands dig from the earth its hid treasure; you build our houses, cultivate our fields, weave our garments, and produce all the comforts and luxuries with which society abounds—and yet you are poor! Indigence and affluence grow up and flourish together; industry starves in the midst of plenty. How shall we account for so strange an anomaly? If we ask our doctors of law and divinity for a solution of this social enigma, we shall be told that it proceeds from our *corrupt nature*! that man is a greedy, avaricious, and selfish being! reckless of consequences to others, so that he can but gratify his own inordinate desires, and appropriate the best of everything to himself! "The strong," say they, "oppress the weak; the wise overreach and defraud the simple! What can be done with so perverse and mischievous a creature, but to 'abandon him to his own heart's lusts, and let him fall a prey to his own devices?'"

Go next to STATESMEN and LEGISLATORS, and hear what they say to the matter. They will tell you that it is a *necessary result of civilization*!—that without the spur of competition we should for ever have remained savages!—that without inequality of rank and fortune, emulation could not have been excited,—that the only incentive to high and lefty enterprise,

the only stimulus to human improvement and human progression, is PRIVATE PROPERTY. If, then, private property and competition for wealth are to exist, it follows that some must be *poor* and some *rich*; some *abound* and others *want*. "We may slightly," say they, "ameliorate the condition of the *working millions*, but cannot considerably improve it. The wit and ingenuity of men have been exercised in all ages to discover this *desideratum*, but in vain! their *theories* have proved *fallacious*. Look," say they, "to your boasted land of liberty and equality, AMERICA! there the people are invested with political power; there they have 'universal suffrage and the vote by ballot.' And are these FREE MEN happy? Are the *labouring population* well housed, well clothed, well fed? Is there amongst them 'no leading into captivity? no complaining in their streets?' Assuredly there is! There, as elsewhere, *competition* keeps down the money price of labour to the lowest scale of subsistence, 'and it is right,' say they, 'that it should be so! Cheap labour produces cheap clothes and cheap bread.'

Come we now to WHIG, TORY, and MALTHUSIAN political economists. These are very pious men, and cheerfully acquiesce in the ways of Providence! "The Author of Nature," say they, "has wisely ordained that a growing and luxurious population should be continually scourged and kept down by pestilence, wars, poverty, vice, disease, and premature death. Were it not for this wise ordinance, men would multiply like rabbits. Like the CATERPILLARS of EGYPT, they would soon 'eat up every green thing,' and at last be driven to the necessity of following Dean Swift's advice, and of devouring their own offspring."

Let us lastly descend to the new school of RATIONAL OR SOCIAL REFORMERS. A class of politicians thus described by the glowing and elegant pen of Coleridge:—"We turn with pleasure to the contemplation of that small, but glorious band, whom we may truly distinguish by the name of thinking and disinterested Patriots. Accustomed to regard all the affairs of men as a process, they never hurry, and they never pause. Theirs is not that twilight of political knowledge which gives just light enough to place one foot before the other; as they advance the scene still opens upon them, and they press right onward with a vast and various landscape of existence around them. Calmness and energy mark all their actions. Convinced that vice originates not in the man, but in the surrounding circumstances; not in the heart, but in the understanding; they are hopeless concerning no one. To correct a vice, or generate a virtuous conduct, they pollute not their hands with the scourge of coercion; but by endeavouring to alter the circumstances, would remove, or, by strengthening the intellect, disarm the temptation.

"The unhappy children of vice and folly, whose tempers are adverse to their own happiness, as well as to the happiness of others, will at times awaken a natural pang, but they look forward with gladdened hearts to that glorious period when

* If in England we hear less of stagnation in the commercial circles than we did a few weeks ago, the lament has not ceased in America; they are, perhaps, not yet used to it as we are; and as a specimen of the existing state of things in New York, we quote the following from the "New Era," published in that city:—

"At no period of its history has there been so great a degree of general distress in this city as there is at this day. Of its mechanics, and other working men, at least 10,000 are now without employment, and the wives and families of these, which amount, upon a low calculation, to 10,000 persons more, are suffering want, many of them heart-rending want. The letters which abound upon our table from commercial clerks, state that there at least 2000 of that educated class who have been dismissed from their occupations, and whose previous scanty salaries allowed them to make little, if any, provision for so sudden and distressing a contingency. Of seamstresses, book-folders, bonnet-makers, and other industrious females, we are assured, from sources likely to be well informed, that 3000 are at this moment in pining destitution, and exposed to heartless temptation and seduction."—*New Moral World*, Vol. iii., No. 44.

justice shall have established the universal fraternity of love."—*S. T. Coleridge. The Friend.*

Of this class of reformers the benevolent Owen is the head and leader. These philosophers tell us that men have hitherto egregiously and most lamentably erred,—that they have been ignorantly attempting to contravene the immutable laws of their nature,—that priests and legislators, mistaking the materials they had to work upon, like unskilful mechanics, have spoilt that which they intended to improve. They contend that MAN is not *naturally vicious*, but just what *circumstances*, acting upon his *organization*, conspire to make him,—that it is possible to take any number of infants from the *breast*, and train them up to be industrious or idle, learned or ignorant, virtuous or vicious,—that so powerful is the influence of early association, so indelible the impress of education, that they may not only be *given* any habits and any opinions, but be made obstinately to adhere to them—and, with few exceptions, pertinaciously to retain them through life. "Could we not," says Mr. Owen, "take an infant of *Jewish parents*, and make a good *Quaker* of it? Could we not take children from this country, and, by placing them in the islands of the Pacific Ocean, make them *cannibals*? If we had been taken from our parents when young, conveyed to India, and brought up in Hindoo families, can we doubt that at this time we should have been true believers in, and devout worshippers, of the god JUGGERNAUT—ready to throw ourselves under the heavy and crushing wheels of his stupendous chariot, as a sacrifice most acceptable to him?"

If man be thus the creature and the slave of circumstances, "Why not," say they, "remove from him every deteriorating and pernicious influence, and surround him with such circumstances as shall improve and elevate his character, and make him a wise, virtuous, and happy being?" "COMPETITION," say they, "ever has been, and ever must be, the fruitful source of vice and misery; it exhausts the energies of man in fruitless and unnecessary toil, corrodes and cankers the mind, and engenders the worst passions of which human nature is capable; it loads the few chosen favourites of fortune with excessive wealth, and keeps the bulk of mankind in indigence and want; it creates a bloated and unnatural monster of monopoly on the one side, and, on the other, starvation and death; and science, in its progress, will increase the evil; it will sharpen the edge of competition and multiply its powers of mischief until it has borne down and destroyed the present system of society altogether."—*Remarks on Rational System.*

"Would you then," say they, "rid yourselves of all the evils which at present afflict you? Would you emancipate your children from poverty, vice, and misery? Abandon COMPETITION and go into COMMUNITY. Do you doubt its practicability?—Look at the AMERICAN CO-OPERATORS! They have tried the system for many years, and find it not only *practicable*, but highly *beneficial*." Mr. Mellish who, accompanied by Dr. Isaac Cleaver, visited the community of RAPPISES in 1811, gives us the following account of their origin and successful progress:—

"The Harmonists, or Rappites, are a colony of German emigrants who settled in America in the year 1803. When the society was first established the whole of their property amounted to only 20,000 dollars. The present stock of the society we estimated as follows:—

| | Dollars. |
|---|----------|
| 9,000 acres of land, with implements | 90,000 |
| Stock of provisions for 900 persons, one year | 25,000 |
| Mills, machinery, &c. | 21,000 |
| Dwelling-houses and public buildings | 18,000 |
| Horses, cattle, and 1,000 sheep | 16,000 |
| Stock of spirits, manufactures, &c. | 50,000 |

220,000

They possess about 9000 acres of land, 2500 acres of which are cleared. The society now consists of about 800 members. It is impossible to convey any adequate idea of the diligence, industry, and perseverance of this extraordinary people; wherever we went we found them all activity and contentment; but they have every inducement to perseverance—they are all

on an equal footing; every member is equally interested in the good of the society. The moral deportment of these co-operators is highly praiseworthy,—there are no vicious habits amongst them. As to lying and cheating, so common in competitive society, they have no temptation to it. As individuals, they have no use for money, and no fear of want."—*Mellish's Travels in the United States in 1811.*

This flourishing COMMUNITY, as well as those of the Shakers, have lately been visited by one of our most eminent political economists, who gives the following account of them:—

"COLONY OF ZOAR."

"The capital of this colony is estimated at 137,400 dollars, about 34,300*l.*, which is altogether clear profit; for the settlers had not a single shilling of their own when they first embarked in their association. Their constitution is as follows.—The chief management of the colony, the keeping of the accounts, correspondence, and direction of Divine Service, have been unanimously intrusted to their leader, M. Baumbler, who had acquired the confidence of the whole community while they were living in Germany. He is assisted by three directors, who are chosen for three years, but one of whom is obliged to resign every year. The election is by ballot, in which every person of the age of twenty-one has the right of participating. Each director has his own department of agricultural, domestic, and administrative economy; they meet every night at the house of their leader, consult upon matters affecting the welfare of the community, and determine the labours of the following day. On the following morning, such persons as have no stated employment assemble upon a given signal, and each of the directors chooses the person whom he considers best qualified for his particular business. The directors are, however, obliged to take a personal share in the most difficult part of their labours, and to excite their workmen by their example.

"With abundance of food and other necessities, it may be truly said that a person may live free from all care in Zoar. Every child too, from the ages of three or four, is sent to the general public school, which is superintended by three females. The children are instructed in easy labours suitable to their age; the girls, for instance, in spinning, and the boys in plaiting straw; so that each has a fixed task, at the termination of which they are turned into the play-ground."—*Penny Magazine.*

"Our first visit to the Shakers," says Miss Martineau, was at their establishment two miles from New Lebanon, Massachusetts. There are 700 members at Lebanon, and 300 at Hancock, not far off. The Lebanon establishment is in possession of about 3000 acres of land, which are cultivated to a perfection seen nowhere else in the United States, except at Mr. Rapp's settlement on the Ohio, where community of property is also the binding principle of the society. This principle seems to us to have acted most beneficially, wherever we have seen it in operation; and this is not to be wondered at, since there is an absence of all that makes people reckless, and a presence of all that stimulates them to do perfectly what they have to do. His kind affections, too, are engaged to do his best for others who are doing their best for him. Nothing has been seen to equal the perfection of the Shaker and Rappite arrangements, in their fields, vineyards, gardens, and homes. They have the best crops, the best wines, the best provisions for the table, the best medicines, furniture, house-linen, roads, fences, and habitations in the country, with an enormously increasing amount of wealth, and a very moderate labour.* They are free from the operation of nine-tenths of the penal law; from all that relates to the protection of property. They have all that they want, and have the means of obtaining all that they can ever wish for. They are free from all temptation to theft and fraud; and the enormous mass of law which relates to the maintenance and transference of property bears no relation to them. I believe no member of these societies has ever been charged with any breach of the laws of the country.

* "The RAPPISES," says Miss Martineau, have an abundance, so much beyond their need, that it is surprising that they work, except for want of something else to do."

"The road through the settlement had not a stone bigger than a walnut upon it. Not a weed was to be seen in any garden, nor a dunghill in all the place. The collars of the men, and the caps of the women, were white as snow. The windows were so clear, they seemed to have no glass in them. The frame-dwellings, painted straw-colour, and roofed with deep red shingles, were finished with the last degree of nicety,—even to the springs of the windows, and the hinges of the doors. The floors were as even, and almost as white, as marble. The wood was put up in piles, supported by stone corner-posts; and not a chip was astray, not a log awry. The shop was stocked with the surplus of their manufactures; linen and woollen drapery, knitted wares of every kind, sieves, baskets, boxes, cordage, casks and pails; medicines, confectionery, and toilette luxuries. They command a very extensive sale for all their productions; especially garden seeds and medicines, of which they send large quantities yearly to London."

Working Men! Will you see this PARADISE before you, and within your reach—and yet quietly and supinely dwell in abodes of poverty? Will you for ever continue to "spend your money upon that which is not bread, and your labour for that which satisfieth not?" "FORBID IT HEAVEN, AND FORBID IT MAN."

My friends! the time and money which you spend in *political contention*, and useless strikes, would carry ANNUALLY several hundreds of your unemployed or ill-employed brethren into peaceful and successful community. Be ye then no longer the tools of hollow and selfish POLITICIANS—their interest is not your interest! If they court your favour, it is that you may carry them on your shoulders to *place* and *emolument*. Take, then, "your own affairs into your own hands."—Club your means together, and institute for yourselves, as the Shakers and Rappites have done, and as the Socialists of Manchester are preparing to do—INDUSTRIAL COMMUNITIES.* Then shall you inherit the boasted prerogative of your nature, and be indeed "*Lords of Creation*." Then shall every one of you "sit down under his own vine, and under his own fig-tree, and none shall make you afraid." Then shall you, and your children after you, enjoy peace, plenty, virtuous contentment, and happiness.—S. C.

* A congress of delegates from various bodies of SOCIALISTS throughout the United Kingdom met at Manchester, May 1837, to consider of and adopt the best means of bringing the COMMUNITY SYSTEM into successful operation in this country. After taking the best legal advice on the subject, it was finally agreed that they should at once enroll themselves under the title of "National Community Friendly Society," according to Act of Parliament, 10 Geo. 4, cap. 56, sec. 11. Their objects are thus stated:—"The objects of this Society shall be to raise funds for mutual assistance, maintenance, and education, which funds shall be applied for the purchase or rental of land, whereon to erect suitable dwellings, and other buildings; wherein the members shall, by united labour, support each other, and arrange the powers of production, distribution, consumption, and education, so as to produce among the members feelings of pure charity and social affection for each other, and practically plant the standard of 'peace and good will on earth,' towards all men."—*Rules*, p. 11.

The amount of subscription required from each member is one shilling per week; which in the four preceding months has produced a fund of 500*l*. This success, added to the liberal offers which they have received of pecuniary assistance as soon as they shall be ready to commence upon LAND, has led some of their more sanguine and enthusiastic brethren to desire that practical operations should be immediately entered upon. Fortunately, however, a great majority of their members, more cool and calculating, are opposed to any rash or precipitate attempt, and are determined to wait until they have made sufficient preparation to commence with *certainty* of success. Mr. Owen, writing from Munich in Bavaria, September 28, observes, "I am much gratified to hear of your progress in Lancashire, Yorkshire, and Cheshire. Go on and prosper; but do not yet suppose you are ripe for *sound* and *successful* action. Spread the principles with firmness and moral courage, as widely as

possible; increase the desire to apply them to practice, but inculcate the necessity for a full preparation of money and industry, with temperance in all things, before that practice be commenced."—*New Moral World*, Vol. iii., No. 52.

Those who desire further information on this most interesting subject, or wish to aid, by subscriptions or otherwise, this noblest of all human undertakings, are requested to apply personally, or by letter, to the Managers of the National Community Friendly Society, at the office, Great George-street, Salford, Manchester; or at the London Branch, 69, Great Queen-street, Lincoln's-inn-fields; where lectures are delivered, and where this, and other pamphlets and books, illustrating the NEW VIEWS OF SOCIETY, may be obtained.

MYSTICISM AND SCIENCE.

A SCIENTIFIC man is one, who affirming that he explains Nature and Nature's laws, in reality, hides and confounds all perception of that which upholds Nature and Nature's laws, and without a due regard to which they cannot be comprehensively understood. A MYSTIC is he, who charged with hiding and confounding all real ideas, alone ventures to speak openly and directly of Nature and Nature's laws, and of the law-maker.

To speak indistinctly and distantly to give out obscure hints of a power and life beyond dead matter, is the office of science. To declare clearly and affirmatively, to assert openly and undiluted the reality and activity of such power and vitality, brings down on such boldness and freedom, the contemptuous epithet of Mysticism.

Here, as in numerous other cases, the words should be transposed, in order to express truly the popular idea; but for the popular expression of the true idea, the words will do very well as they are. All that is necessary is for the Mystics not to be afraid or ashamed of being so called. Then the word would soon resume its ancient, its honourable and correct meaning. The word would do very well for the men, if the men would endeavour truly to deserve the word.

This personal literal introduction serves to let you know that one at least is willing to brave the sneerful use of the word "Mystic," in the hope not only of successfully recalling a good word from bad ideas, and false, degrading, associations, but of audibly declaring the existence of a valuable reality, where the merely scientific man who now possesses almost exclusively the favourable ear of the public, asserts that no truth can hopefully be sought. In spite, however, of the scientific man's endeavour to keep us from investigations which he avows an incapability of clearing up, these questions do and will, somehow or other, occur to and agitate every mind whether learned or unlearned.

Why our scientific men act this churlish part of the dog in the manger, unable themselves to manifest the truth, yet denying the power to others, is only reconcilable with a state of mind I should be sorry to attribute to any one individually. Of a class, however, I have less hesitation in saying that they appear to be influenced by the narrow-mindedness of sectarians, and the mental idleness, the imitiveness, the submission to authority and precedent, which reproachfully distinguishes England above all other European countries.

I may be allowed to add that the Mystic has this superiority over the scientific, that the former comprehends the latter. The Mystic is an essentially scientific man, but the scientific man does not reach to Mysticism; just as the algebraist covers the arithmetician, and goes much farther; while to the mere calculator, the mathematician is an incomprehensible Mystic.

It is therefore clearly not within the province of the scientific man to dogmatise on the assertions of the Mystic. Above all, when he spontaneously declares that "the language used is without a meaning to him," p. 191. The Mystic is in no such difficulty with respect to science; he can find at least a relative in every proposition, theoretical or practical.

Is it not almost enough to drive the Mystic for evermore inward to communion with his own teacher, and to make him cease regarding the progress of the human race, when the very occasion upon which he was writing, the only idea he wanted to

THE SHEPHERD.

bring prominently out, is so defectively done, that the most acute and lively mind can overlook or mistake it? No wonder that Mystics are generally chargeable with shutting themselves up, when at the moment one declares the inutility of the teacher, the confusion of the author, the mischief of the priest; it is supposed that he has in view some "peculiar process of education," p. 191. Or when he avows the necessity of a something beyond, and besides all that is figured forth under the ideas of redemption, or regeneration, or renewal, he is accused of wanting "first to renew the nature of man, and, secondly, to renew the forms of society," p. 189.

How is this difficulty to be surmounted? For the Mystic must not to give up his mission merely because he does not immediately succeed to the extent which would perhaps more gratify an obtrusive self-pride. On the contrary, failure must double his energy to discover his own defects, and quadruple his humility to acknowledge them: especially under the circumstance of free speech so friendly allowed in the pages of the *Shepherd*.

Suppose a native of some distant land where the art of painting, as a generic or ideal expression is totally unknown, were to visit Europe, and, returning home, used every effort which language will allow to explain to his fellow countrymen, the enchanting art which had excited his deepest admiration, what chance would such a one have of being understood? Let him endeavour to give utterances for realities which he had seen and felt, and, which in fact, he himself is. Forced, as necessarily he must be, to use the expressions which his neighbours constantly and exclusively used to other and lower facts, or at best, to mingle the individual words in new combinations, would not the happy shepherds of such enlightened regions exclaim, "he uses language without a meaning to us?" We know very well what it is to put a red mark upon our sheep, or to brand the hide of any animal; and we suppose he means some refined and improved mode of doing this. But if all the sheep were well daubed over to day, would not to-morrow's rain wash off every vestige? And as one scabby sheep mars the whole flock, what security have we for even a momentary continuance of this new mode of colouring sheep?

The traveller has to reply, "No, no, you mistake the affair altogether; it has nothing to do with a system of re-colouring what is coloured already: for, if once done, it lasts for ever; or, indeed, so long as the sustaining substance lasts. But, in fact my friends, I perceive it is my inconsideration which has led to this confusion. Either you must go to Europe, and see these works, and see the way in which they are produced; or some specimens must be sent here, that you may be at least convinced of their existence. To what source you may attribute their origin will be another question. I can only in the mean time verbally assure you, though I perceive the futility of it, that the things I speak of, are real in themselves, and are also made to be representative of realities much higher than themselves."

And with this appearance of arrogance, must he give up the subject he had endeavoured to introduce to their comprehension, lucky if 'he escape with whole bones from the matter-of-fact, and common sense indignation of themselves or their flocks; especially of those sleek, well behaved black rams with their densely logical spiral horns.

A few of the natives, however, are docile or curious enough, seeing he is an honest man, to imagine that the traveller is attempting to describe something which he really has seen and felt. They, therefore, meet him privately, and though himself no artist, he endeavours, by means of such rude materials as lie about, to develop in them some intuition of the fact of their being such an art; leaving it to themselves to allow the art to unfold itself in them, or in other words, to be added to their present extent of being.

In by no means so good a position as this supposed traveller, is the man amongst us who asserts, in a direct manner, the existence of a yet unacknowledged, unconscionable addition to our being. To the frigid formula of words alone can he apply for means of communication. The desire to know more by personal and more intimate (mystical, if you will), modes, is more rarely his good fortune, than to be passed aside as the reviver of old dogmas and doctrines said to be long since crushed under

the wheels of the modern giant "steam power," or evaporated by the admirable discoveries of all-dissolving "chemical-agency."

Still it must be patiently declared again and again, in language of all kinds, that this additional nature to the human nature is to take place.

All analogies and illustrations, however vividly they may picture, to the author's mind, the point he wishes to enforce, cannot be otherwise than defective in some material point. In the case where a thing unknown to the hearer is illustrated by a thing known, the figure must necessarily be objectionable on another ground that it has a tendency to keep the mind to dwell on the illustration, instead of going onward to the thing itself.

Man's mind we all perhaps perceive, and admit to be so far comparable to a tree that he has his period of germination, his leaf season in youth, his summer blossoming, his autumn ripeness. All which is in the natural order from below upwards. Thus in man the expansion of the body is followed up by the bloom of intellect, and succeeded by the ripeness of morality. But all these processes, whether carried on in the open air, or in the forcing house of college erudition, can only faster and faster, or more and more extensively push the earth born nature of the plant or of the man. The crab-apple will remain a crab; the natural man will continue a natural man. Before the tree can produce any other than crab apples, the orchardist must come and graft, or bud, a new species into or upon the old stock. It is clear that no alteration of position of the trees with respect to each other nothing that the trees could do, each for itself, or to its fellows, could produce any such result. If they could succeed by any self effort in purifying or increasing their growth, it could only be with the nature that they have, and not with the nature that they have not. This would end in producing more and more of the acid, crab, principle, which is the very one to be suppressed—not reformed, or augmented.

Thus Education may expand our external powers, may stimulate our intellect, may enlarge our moral feelings; but totally in vain, as to any special alteration of our being. The orchardist must be allowed to come and prune away all these forced growths; and, grafting the new species upon the concentrated sap of the single stock, suffer to grow a new life, with new leaves, new blossom, and new fruit similar in name, only to those which grew in conformity to the old life.

A MYSTIC.

REPLY TO THE PRECEDING ARTICLE.

THIS is the old story over again about regeneration—piecemeal too—that is, one at a time. There is really a great deal of this regeneration in the world. It assumes a great variety of shapes. A woman not long ago told us her son was taken with the new birth, and could not work; he lay in bed all day. She herself and husband have had it a long time. She feels God within her, has strong impressions, cares for no knowledge of any kind; she very calmly says, "My God will teach me what is necessary for me." But what is very singular, she has a very great aversion for another individual in the same state with herself. Of all clames in society there is not one which is more divided in heart and soul than the mystics, or the regenerate. The fact is, that individual regeneration is an impossibility. What is called the new nature is a mere fancy. Every man gets a new nature by conversion of any kind. Make a Christian into a Mahometan, he gets a new nature, a new inward being, and feels it too. When a man begins to ride a hobby he gets a new nature. We know an old gentleman who was once a most inordinate drinker, and had no command of his appetite for liquors, who at last found a substitute in the study of botany; he is now a most inordinate botanist, and has informed us that there is scarcely a plant, or even a weed in the country, of which he cannot give the name, both vulgar and scientific. This man has got a new nature. He is now a sober regular living man, and keeps time like the seasons. He has found an addition to his nature. A man may find a new nature by the study of any subject; but it neces-

sarily happens that the study of "God" produces a peculiar effect, different from that of vulgar science, because God is a living conscious being, and botany is a dead subject; the man who muses upon God, therefore, necessarily concludes that he has the deity within him, just as the old gentleman above alluded to has botany within him. But the old gentleman can give us a proof of his skill. We have walked over fields for a whole day with him, and heard him lecture on the virtues of plants, and give their individual names and histories. Here was proof positive. What can the divine-natured man show us? His science costs him very little. We know some who have put it on in a twinkling, and found it a very convenient excuse for ignorance. They talk about a thing they know nothing of, and cannot explain, for nobody can understand them, and they cannot understand themselves. They merely assert, and blame the hearer's unconverted nature for not comprehending them. If this be not quackery, we should like a correct definition of quackery. Robert Owen informs us that nobody understands his system but himself. Indeed, we have heard him say publicly that it requires a man to be regenerated to receive and fully appreciate it, and, in one sense of the word, Robert Owen is right, for every man who undergoes a remarkable change of principle, and acquires fixity of mind, instead of doubt and irresolution, is regenerated in a certain degree. But all these new-natured people are remarkable for this, that their own sweet selves are the standard for others.

Now we have no such presumption. Our motto is, "God in the whole." Individuals are devils necessarily, devils to society, and devils to one another. The individual spirit is a fractional spirit. We say unto men "unite, and let the universal spirit of God that is in man reorganize or regenerate society." We do not prescribe to them what they are to do after this. Whatever the whole does we submit to. There will then be only one patient to heal. By the system of our friend there are millions of patients, and new ones daily appearing as the old die off, and everlasting apostacies with seven devils, where there was only one before. When society is united apostacy is impossible.

Our correspondent's observations respecting scientific men do not apply to us. We suspect he reads only his own articles in the *Shepherd*, or he would not falsely accuse us. Our principle has always been that the positive acknowledgment of God is the first axiom of philosophy. All philosophy without this is delirious. There is nothing more insane. But we have taught that science is twofold, negative and positive. Vol. i. p. 394-5. The first treats of proximate causes only, the second of the universal cause. We will quote the passage, just to convince the reader of the inaccuracy of our correspondent. After showing that science negative treats of minor causes, as heat is the cause of evaporation, &c., we speak of the positive thus:—

"The positive system employs the word God as the great uniting principle, which combines in one all those proximate secondary minor and disconnected causes which the negative system pursues. It gives a unity to all this multifarious scene of nature which science examines in detail. It views the whole with the bird's eye prospect of a generalizing mind, and by the help of those discoveries which the negative system brings to light, it dives into the plans and mysteries of universal nature, revels in the sublime and intellectual contemplation of its unique intelligence, and anticipates the future destiny of man from an analysis of the present and the past, and the analogy of the whole and its parts. Moreover, there is this peculiarity about the positive system, that it connects the whole history of the species by one great intellectual link of conscious purpose. It rejects the unphilosophical and absurd idea of chance or incidental occurrences, by including all systems of religion and politics within the machinery of nature, not as fortunate or unfortunate coincidences having a passive origin, which is a most insane idea, but as movements originating in an active will."

Thus wrote the *Shepherd* in 1835. It has never contradicted it since. But we dislike all cant. We like positive axioms to be laid down, and we like to adhere to them; but the man who talks much of his divine nature, makes himself unneces-

sarily a suspicious character. Jesus Christ said, "Tell no man who I the son of man am." Be not your own trumpeter. Let your actions speak, and your words testify. But, for wisdom's sake, let them be intelligible. We hope our correspondent will answer the following questions:—

Has he himself got this new or additional nature? and what is its fruit? and how is it distinguished from self-conceit?

INTELLECT AND MORALS.

"We know," says Dr. Channing, "nothing so fitted to the advancement of society, as to bring its higher minds to bear upon the multitude, as to establish close connexions between the more and less gifted, as to spread far and wide the light which springs up in meditative and sublime understandings.—On the faithfulness of great minds to this awful function, the progress and happiness of men chiefly depend. The most illustrious benefactors of the race have been men who have risen to great truths, have held them as a sacred trust for their kind, and have born witness to them amidst general darkness, under scorn and persecution, perhaps in the face of death. Such men, indeed, have not always made contributions to literature,—for their condition has not allowed them to be authors,—but we owe the transmission, perpetuity, and immortal power of their high thoughts, to kindred spirits which have concentrated and fixed them in books."

"Some may think that we are exalting intellectual above moral and religious influence, that the teaching of moral and religious truth by the comparatively weak and foolish, is the great means of renovating the world. This truth we indeed regard as 'the power of God unto salvation.' But let none imagine that its chosen temple is an uncultivated mind, and that it selects as its chief organs the lips of the unlearned. Religious truth is, indeed, appointed to carry forward mankind, but not as conceived and expounded by narrow minds,—not as darkened by the ignorant, nor as debased by the superstitious,—not as subtilized by the visionary, nor as thundered out by the intolerant fanatic,—not as turned into a drivelling cant by the hypocrite."

TO CORRESPONDENTS.

The Omnivorous Animal will be inserted next week; but we mean to exclude one page, which is very much calculated to destroy its effect with all but those few to whom the writer has no occasion to explain himself. We assure him, that in so doing, we merely impose upon him the same restrictions which we have long ago imposed upon ourselves. We must concede much to others, if we expect concessions from them. Feeling should never be explained or exposed. She is a veiled nun, and will fly from those who attempt to draw the veil aside. She loves those best who say least about her, but wrap her up in pictorial images, and send her, unseen, but felt, in all kinds of vehicles and commodities. Descriptive poets are her favourites. They are the best mystics. We have dived into many mystic writings, but sweeter, and holier, and purer feeling, we never found in one, than in Goldsmith's "Traveller," "Deserted Village," or "Edwin and Angelina." Those who attempt to describe the indescribable, and lift the veil of Isis, commit an act of violence, which Nature never fails to punish some way or other. It is a pity to kill the goose that lays golden eggs, merely to survey the centre where the eggs were generated. This was done by the very noblest minds of antiquity, the modern Platonists, Ammonius Saccus, Proclus, Plotinus, Amelius, Jamblichus, and Porphyry, who were like men climbing huge precipices, and leaving the people to stand and gaze on their extraordinary daring. It is better to take your gifts down to men, than to go to the tops of cliffs and mountains, and hold them out for their acceptance. "Who is a wise man, will understand these things; prudent, he will know them."

Three Hundred Maxims for the Consideration of Parents—we will notice them next week.

In page 189, for "latter part 26th verse," read 18th verse.—Page 190, for "Deut. 1, 41," read 1, 41 to 45.

UNIFORMITY AND VARIETY—IN SYSTEMS.

Deh fate un corpo sol di membri amici.

"Oh make one compact frame of friendly members."

Tasso—Jerusalem Delivered, 1, 31.

WE think it is Hutchison, who makes uniformity and variety the standard of beauty. Whether they be the standard or not, we shall not stop to inquire; but certainly we regard them as essential ingredients of a state of happiness.

Along with uniformity we include unanimity, as the source from which uniformity proceeds. Unanimity, with variety of mind, is therefore co-existent with uniformity, and variety of external arrangements. We prefer the words expressive of the outward forms, because they address themselves more clearly to the understanding.

It has been the ambition of legislators and moralists, in all ages, to produce unanimity of mind upon many important topics, and especially upon religion. Laws have, therefore, been enacted for the limitation of thought; vainly attempting to accomplish by force, what can only be efficiently done by conviction. But the consequence has been violent irritation, and infinite division of opinion, which, perhaps, is greater now than at any former period, because now authority is destroyed, and each man thinks for himself.

Along with this division, however, has grown up a greater outward display of toleration, so that variety is more pleasing than formerly. Where once a difference of mind would have led to blows, the result is now a hearty laugh, or a good-natured smile, with the free-minded; but with the stern disciples of the old theological schools, it goes no farther than a good hearty scowl, and a word of admonition. There is certainly a little progress towards perfection in this, more especially when it does not originate in indifference towards truth, but merely in a tolerant and intelligent spirit. Much of it, however, at present, arises from indifference. A constant tendency to throw serious subjects into ridicule, is the peculiarity of very many modern liberals. This is not right. It is prejudicial to truth. It has the effect of repressing much sanctimonious folly, but it counterbalances all the evil it destroys, by that which it creates. This is not liberality, but intellectual licentiousness. Such people will sport with the finest truths, and prostitute moral and intellectual beauty, with a reckless unconsciousness of the influence of their conduct upon the moral feelings of society. But it is a law of Nature, that laughter never can ultimately command respect. Gravity, even accompanied with ignorance, is more respectable than wit and learning, under the direction of levity. It is the moral sense of mankind, which establishes this law. There is a sort of "Divine Instinct," as the author of the "Three Hundred Maxims" expresses himself, which never fails to give its final verdict in favour of sobriety of mind.

Sobriety is generally consistent with itself, and has an attachment to truth. It is the ruling power of society; but it is a vicious power, in a state of tutorage, or imperfection. All bigotry lives and fructifies in it. Gravity is the peculiar feature of partisanship, especially religious; and attachment to principle is often carried to so fearful an extent, that the laughter-

loving witting, or giggling fool, is often, by way of contrast to his sober counterpart, denominated a fine fellow, and a boon companion. We are not surprised at this. The man of principle, as he is called, will too often quarrel or combat over a word—he will rebuke, correct, admonish, and even frown, for a very subordinate offence, or an insignificant error of judgment. Co-operation with such men is impossible. Yet, although the former are more social, they are less trustworthy and constant; less hearty in the pursuit of a definite object.

Here are two great evils, therefore. On the one hand, a sort of negative indifference to truth; and on the other, a disagreeable, unsocial, hammering of crude notions, under strong antipathies for their opposites. The former party is the most social; the latter the most intelligent. But the most intelligent of all is a party which cannot well be formed until society be altered, which combines the sober research and ardent attachment to truth of the one, with the good-natured indulgence and toleration of the other.

But even this party must have a principle of unanimity by which to unite, or party it cannot be; and that principle must be some universal and heart-searching proposition. Any subject is heart-searching, which is deemed of vital importance. The eating of pork was once heart-searching. It caused many bloody wars, and violent persecutions. But there is no religious principle more uniting in its influence, than that which regards God as the author of all that is—the sole source of good and evil. This necessarily puts an end to religious strife, and leaves man at liberty to act for himself, as the sole judge of good and evil relative to himself. The will of God becomes then synonymous with the will of man, and the true word of God becomes then the living, active spirit of the present generation of men, and government becomes a theocracy. This principle would put an end to all religious strife. There would be many minor differences, but they would all be temporary. Happiness would be the test of the value of a principle of action. At present the test is an old book, written God knows when, and translated and retranslated by men who neither knew the language well, nor understood the subject; or the test is a string of articles, written nearly three hundred years ago, in the midst of bloodshed and strife, occasioned by the very doctrines insisted upon. Happiness is out of the question; good works are not taken into consideration; the satisfaction of the poor is not regarded as a criterion. The test of truth is a scholastic notion, a grammatical formula, a mathematical proposition, in which the heart has no necessary interest, but in which a sort of artificial interest is created, by connecting it with worldly possessions, honours, emoluments, power, fear of God and the devil, hell, heaven, judgment, and eternity,—thus causing a discord to exist between happiness here and happiness hereafter, and testing the value of a doctrine or system by a vain imagination, instead of a present and felt reality.

Under the guidance of such a theological proposition, we say uniformity and variety would act most harmoniously, for the variety would be the result of peculiar tastes, and could excite no bigotted antipathy in consequence of religious zealotry.

But it will be many generations before all men could be brought to the acknowledgment of such a proposition, and under any other it would be impossible to reconcile a nation to a social system, without variety amounting to discord. We shall suppose, for the sake of illustration, that the British nation resolved to adopt a social system, such as that of Owen or Fourier, and to establish communities all over the country. We think it very probable that a large proportion of all sects and parties would have no objection to the community of property. The high and low Calvinist, the Armenian, the Anabaptist, and Pædobaptist, &c., could see nothing in the mere community of property to do violence to their creeds, and the poor of every persuasion would hail the advent of such a system as a great deliverance. This is a uniformity principle, therefore, supposed to be already gained. But there are minor considerations, vital with all, but in different senses, which would create rival and opposition communities immediately. The marriage question is one, public worship is another. We should have Baptist communities, and Pædobaptist communities, and Wesleyan, and Calvinist, all agreeing upon the uniformity principle of community of goods, but living at enmity upon the variety principles of doctrine and opinion. But a very great advantage would be gained by such a separation of sects. We should then be able to determine, which at present we are not, which species of doctrine is best calculated to constitute a system of peace. It is very probable that such a trial of worth is determined upon in the councils of heaven, it is impossible to divine futurity in minute particulars, but we can positively say that the means of observation, and of judging, under such circumstances, would be more perfect than they now are, when the various sects are lost amid the ocean of society, and never can be viewed or judged collectively.

Had Owen proposed a system of this kind in 1817, he would probably have had many more friends, but he would then have concealed his own ulterior plan, which is one of the plans to be tried by experiment. It is better as it is. Government was very much disposed at that time to make an experiment, but was alarmed by the pecuniary demands of Mr. Owen, and as the tide of public opinion soon turned against him, no additional motive was furnished to induce it to yield. Had the experiment been made, it would have been sectarian, and being made with paupers, would have arrayed the prejudices of honest pride and independence against it. Now, Owen's plan is an additional sectarian plan—that is, it is the plan of a party, and would, in a universal system like that we are describing, compete with the rest.

Nay, there are so many eccentric beings in society, that if scope were allowed, we have little doubt that there would arise communities of bachelors and maids, like the Catholic monasteries. The number of individuals who pursue a solitary life from choice, cannot be determined, under present circumstances. Many old maids are grievously wronged by a harsh judging world, which sets them all down in the list of disappointment, as foxes grinning at grapes. It is our own opinion that immense cohorts of genuine devotees to celibacy would be found—in every nation—to whose peculiar services society would probably owe more than to any other party. The world is already greatly indebted to celibacy. The monks, with all their faults, were the intellectual nobility of the dark ages. They have not only faithfully preserved their precious deposits, but spent immense labour and time in collating manuscripts, composing indices, illustrating obscurities which render the study of ancient history, literature, philosophy and theology comparatively easy to the modern student. From such communities we could not expect poetry, novels, and romances, or such aerial productions; but heavy, hard-headed labour, deep research, invention, and discovery, would be found to court their society. We should have communities of light-headed people—vigorous in body, and jolly in behaviour, devoted to the dance and the song,

Married to immortal verse,
Such as the melting soul may pierce,
In notes with many a winding boat,
Of linked sweetness long drawn out, &c.

We should have communities of artists congregating for mutual

benefit and inspiration; then dispersing throughout society for the distribution of their talents, and the reward of their merits. We should have communities of philosophers, all ultras in their views, who, tired of the common-place modes of vulgar life, associated together to elevate their minds into infinities and eternities, and build their eyries in inaccessible cliffs, where minds of ordinary wing could never accompany them. These, and a thousand other varieties, might all exist upon a principle of uniformity, comprehending nothing more than community of landed interest for the material department, and toleration of variety of opinion and discipline for the spiritual, or mental and moral department. The most attractive would be the largest, and the most successful in the ordinary business of life and production of common-place enjoyment.

Taking this view of the prospects of the social question, it is almost immaterial what particular party have the start, provided others follow in succession. But as the agitation of the question in its first movements, is the hardest labour of all, and surrounded with the greatest difficulties; it seems to us, that the most universal and popular views compatible with liberty of opinion, are most likely to prosper. But should any individual party succeed, another party will assuredly follow upon a different principle; and every succeeding attempt will be different from its predecessor. Uniformity, without variety is impossible, under any view of the question. For even a national movement must give way to the prejudices of sects. All this variety, foreseen, and certain, results almost entirely from the religious principle. Were that unanimous, the variety would be very trifling, consisting chiefly of eccentricities, which would be productive of much social satisfaction; but with sectarian opinions, or fundamental theology, it is vain to hope for social uniformity, without a long experimental trial of the comparative merits of each system, for each party must necessarily believe itself best fitted for the exercise of the social virtues.

Take any view which you please of the subject, it is a religious subject; the struggle, is a religious struggle, and deeper and deeper must its combatants dive into those all engrossing questions, which always have ruled, and now bear sway over all civilized and barbarous nations. The battle is greater and nobler than the people imagine. The present is a material age, it is not the last, it will soon be over, and a battle of principle will supersede it. But there is one thing which may be urged in favour of the materialists at present, and that is, that the battle of principle may be fought after the material question is settled. This is true, the material question must be settled first, but we never can confine ourselves solely to one question; we must always have a variety of questions before us to direct our judgments in the settlement of one. No question is insulated, and no man can give a judicious verdict upon a case, who does not perceive the consequences of his verdict. We look beyond the material question of mere territorial community. We always have the ulterior idea in view, and the more so, because, others neglect it. We should, probably, say less of it, if others said more. The importance we attach to it, comparatively to the other, is not to be determined by the frequency of allusion to it. We are merely filling up a vacuum, which we perceive in the investigation of the subject. We are calling the attention of our readers to that, which others neglect or despise; and were the material question altogether overlooked, we should probably, devote ourselves for a season, almost wholly to it, till we found a coadjutor to enable us to take up the spiritual counterpart. The mind is the being to be consulted; the feelings are the parties for whom we ought to legislate; both these are invisible principles; the invisible, is the source and the seat of all happiness, the beginning and the end; the visible are merely media of enjoyment. These media are of immense importance; but they are good or bad only as the invisible spirit feels them. It is the spirit which selects them, and the spirit that enjoys them, and uses them. It is all a question of feeling, of spiritual feeling. Here it begins, and here it ends, and here it rests in the spirit for ever.

THE OMNIVOROUS ANIMAL.

SOME weeks since there were inserted in the *Shepherd* various observations, *pro* and *con*, relative to the comparative merits of the several kinds of human diet. I do not think the subject was much, if at all cleared up, but it seems to have been lost sight of. On reference to the former numbers, it appears that the discussion was suffered to be extinguished by a sort of jocular attack. Now, I like a joke very well myself in its proper place, and of all the serious subjects for man's consideration, I will admit his belly may bear satirising as well as any. Yet we must not be thrown aside from the deeper value by a horse laugh.

I dare say I may be very singular in my fancy, but to me the matter is of much importance, and if you will tolerate it, I will endeavour to give some facts connected therewith, or, in short, the experience of my own case.

I know that the sensual man can settle the debate at once, by a successful appeal to the fact of his own gratification, his pleasurable sensations, his happiness, as he calls it. I also know that the scriptural man can continue to justify his sensualities by quotations, to the effect that "not that which goeth into the mouth defileth a man," &c.

Yet I think, looking at the subject candidly and fairly, on religious, or on moral, as well as on scientific grounds, it is exactly of that kind which is open to question and investigation, and that in the mixed state of existence wherein we now find ourselves immersed, it should be questioned and investigated. For though in itself it is one of a lower character, it has connections of a high character, and I venture to assert, that in a mediate mode, its relations are of the highest kind.

After several changes of my interior position, as from logic to action, from action to feeling, and so on, mostly leading to a deeper unfolding of the interior life, I resolved a few years ago to make the trial of abstaining from animal food, with all its usual accompaniments. I was in but middling health at the time, but my chief impulse originated in the perception that some friends, who had for many years adopted that plan, were always in a state of mind and body so much more free and elastic than myself.

The most immediate results of the experiment worth remarking, was the fresh outbreathing of an eruptive acid disease of which I had been previously cured, and which the continued stimulation of what is called good living kept temporarily concealed; thus justifying the theory, or rather explaining the facts of those medical men who recommend stimulating diet in cutaneous and glandular diseases. Almost every kind of food I took underwent such immediate fusion, if I may so describe it, as to show some powerfully bad quality in the stomach, which I would designate as excess of acid. Perhaps, if any state would excuse the use of animal food, it was mine. I, however, persevered, even to an extreme, that I need not enter into. Employing the medicated vapour bath to take off the old refuse, I have gone through the difficulties with such success, that at the present moment I am thankful to say I am better than I have ever been since my dyspeptic days commenced.

These are the physical facts as compressed as I can narrate them. Probably they are too brief, but they must submit to brevity for the sake of the more important mental facts.

What do I gather from this experience? First, that I would not recommend to any person over forty years of age to attempt such an alteration in his system, unless he be prepared to meet ultimate consequences. If any of that age be resolved, then temporary excitements of a purifying nature, such as bathing, gymnastics, and the like, may be adopted, until the new system is found to work harmoniously. Far, however, are to be preferred excitements of a moral and intellectual nature. It is a known fact that an imprisoned convict requires more food, especially of the animal kind, than does the free labourer in the open fields. The benevolent Howard ascertained this, and the poor law investigations have shown it to be the customary state of things. An increased dose of mental occupation is, therefore, necessary for such as resolve to make light of the body. All which you perceive harmonizes very well. For

the time and money saved by the abstainer, enable him to be *sin* to edge off from his mechanical work if he be a poor man, and thus he gets more time to think and to act for the higher ends of his existence. He can afford to cease that excess of heavy labour, which is necessary in order to find the means of keeping his stomach in subordination, or rather in pacification, under the high-pressure system.

If in a state of life where money is not a great object, how much good could be done in the time thus saved? In the families of the rich and middling, towards the conclusion of a heavy breakfast, with its super-addition of eggs, ham, &c. &c., comes the important question.—"Well, my dear, what shall we have for dinner to-day?" Half an hour may be consumed in this discussion; then, "When can you be at home to have it nice and hot?" Off goes the lady to spend the morning in the agreeable and highly intellectual task of ordering the articles of the various tradesmen. Then, wherever he may be, or however engaged, the husband must put off every thing to be at home with his appetite at the appointed time. The necessary repose for digestion completely blocks out the whole of the participants from any further interior efforts for the day. The belly has them tight to the table, and there he keeps them. Hence you find that music, or what goes by that name, is so fashionable. It requires scarcely any mental exertion to play over what is known, and none at all to hear it.

After all, be it observed the actual support of the body must come from the inside. The soul's health and strength must support those of the body. And who will dare assert that the mind's health is the result of the body's eating and drinking? The universal mind must maintain the individual mind, and not backwards from the individual to the universal: the individual mind, by its body-derived health, sustains the body, and not the body sustains the mind. The body imbibes and uses the food in obedience to the healthy mind, and not by any self-power, and the food does not otherwise strengthen the body of a living person, any more than it would if crammed into a dead body, which is demonstrable in diseased persons.

There is perhaps no result of abstinence more striking than this, clearer realization of the distinction between body and self. Many of your readers will at this festive season be cracking their nuts round the family fireside. If they perceive a nut a little larger than ordinary, rather darker in the shell, more glossy and fat looking, they may conclude that the fruit-eater has omitted to throw away one of the bad ones. Let it be cracked, no very difficult matter, and they will probably see that the kernel, or what should be the kernel, is a soft much enlarged, but much diluted, worthless mass, adhering nearly all round more closely to the shell than to itself; and the living germ will be sought therein in vain. Such a fellow was not a meat eater, but he very well describes the state of one so far as a confusion of man's two distinct natures is concerned. But a good sound nut will rattle in the shell before it is cracked, and declare by the tone that he is sound.

On which it may be observed that we have had very many clear sighted intellectual men, not only among the flesh eaters but even among the great drinkers.

I would say in reply, that I think you may smell out the channels through which the ideas of every man come, by a comparison and investigation of their works. Not to occupy too much of your space, I will leave that proposition to your better-read contributors, and merely name two well known individuals, very much alike in their public pursuits. Both were vehement politicians, both wrote for education, both wrote and spoke largely on general topics. I mean Sheridan and Cobbett. The former a wine-bibber; the latter a milk-sop. While the stimulated man could rise no higher than a mere pronouncing dictionary, the temperate furnishes us with grammars, full of acute reasoning. While one writes plays of doubtful morality; the other brings forth permanent essays on finance arising out of the topics of the day. One involves himself in debt by personal extravagance, the other by his public attempts for man's amelioration. One dissipates his personal energies in court vices, the other concentrates them in agricultural plans. I am not unaware that the better of the two was not faultless; but remember, he was not an abstainer. Though abstemious, he

argued warmly on the beer and bacon side of the question, and had a vast deal to much of that kind of mental colour.

Much more remains to be said, and above all, we must not fail to allude, so far as propriety will allow, to the hymeneal consequences. So that you are likely to receive another note from

A MYSTIC STUDENT.

Christmas 1837.

[Our correspondent confounds the two Sheridans.]

INQUIRY INTO THE RELATION BETWEEN FAITH AND KNOWLEDGE.

By the Transcendentalist.

ESSAY II.—WHAT FAITH IS NOT.

In our first Essay we have found, that, previous to all inquiry, two categories must be known, viz., true and false.

Now there are two states, one of decision, another of scepticism. For action, the first state is requisite; the second is merely prior to the first state, or, if persisted in, produces nothing but positive inertness. The state of the mathematical student, mentioned in our last, is merely one of temporary scepticism; this lasts while he is examining the demonstration, which being done, he pronounces his decision, namely, that the proposition is true. Scepticism of this kind is the very reverse of inertness; it renders the student impatient, and stimulates him to action, namely, to the search after truth. The scepticism of the man who does not inquire, is a state in which he chooses to remain; as it does not stimulate him, it is a lasting proof of his inertness in a particular branch. Understand, by scepticism is here meant the refraining from placing a proposition under either of the categories of true and false.

Our student has hitherto been considered a mathematician, the pursuer of a science which guides to *certainty*. Let us now take an historical student, who can, at best, only arrive at a probability more or less strong. Suppose him investigating the truth of some ancient tradition; that he finds two reasons for believing it to be false, and five equally strong reasons for believing it to be true. He would be sceptical to a certain extent, that is, he would not *know* under which category to put the proposition, but still he would say, "If I must put it somewhere, I will put it under the category of true."

We will now leave students, and consider *practical* men, whose energies are not directed to the mere acquirement of knowledge, but to the performance of some act, in consequence of a previous knowledge, or conviction. A man of business, for instance, goes in the morning to his banker's. The propositions which he assumes to be true are that the banking-house has not been burned down the night before, that it has not stopped payment, &c. &c. He cannot prove the truth of any one of these propositions, cannot produce the slightest chain of evidence; all that he can rely on is the fact, that a house on fire is more uncommon than a house not on fire, and hence, as he has to assume one of the two to be true, he decides on the latter, and walks to town accordingly. The student, who is merely pursuing knowledge, stands in quite a different position from the man of business; the former may, if he like, remain four or five years in a state of scepticism as to whether there really was a King Sesostrius, and may employ all that time in weighing the evidence. Not so the man of business; nine o'clock comes, and off he must go, for he cannot stop to wade through the *Times*, *Herald*, and *Chronicle*, to see if there has been a fire, but he at once assumes there has not, and he starts to business accordingly.

Now we see the use of our reducing all investigation to an inquiry under which of two categories a proposition should be put. Were there more than these two categories, scepticism would be triumphant, and one of the greatest springs of action would be stopped. The argument, *ad absurdum*, would be crushed at once. This argument merely proves that a proposition is *not* under one of the categories, and from this it is immediately inferred that it must come under the other. Suppose (if it be possible to suppose a logical contradiction), that there were a third condition, besides being "safe," and "unsafe," in what a situation would the man of business be! It not being

proved that his counting-house is unsafe, he at once assumes it is safe—it must be, or the other. But suppose the non-predicating "unsafety" of his counting-house did not necessarily involve safety, the check to action would be extraordinary, the non-proving one case would leave open two others, one great species of argument would be annihilated, and scepticism would reign triumphant over action.

But to what does all this lead?—To the following point. Scepticism cannot long be the state of a man of action; if he were forced to scrutinize every proposition with the minuteness of a speculator, the whole world would be speculating, and nothing would be done. Promptness, we have further shown, depends on a man being able to say "either this or that;" the smallest balance of evidence is enough for practical purposes, or the non-proof of a proposition being under one category, is sufficient to assume it under the other, and off starts the practical man, guided by never so small an advantage in either of the scales.

The chief spring of the practical world is, as we see, not knowledge in the mathematical, and scarcely in the historical sense of the word. Ask any one, if his friend So-and-so is alive, and he will answer "Yes," merely because he has seen him a fortnight before, and has not heard to the contrary. If you press him, and say, "Do you *know* he is alive?" he would answer, "No, but I *believe* so."

This word "believe," which here means no more than a placing a proposition under one of two categories, on probable, but not certain evidence, has been, and will continue to be, the cause of warfare between the faithful and the infidels. The infidel attaches no more meaning to the word "faith," than is here attached to "belief," in the mere worldly sense of the term. "Belief," says a note to Shelley's Queen Mab, "is utterly distinct from, and unconnected with, volition; it is the apprehension of the agreement or disagreement of the ideas that compose any proposition." If this were an adequate definition of "faith," there is no doubt the infidels would be invulnerable; it is absolutely impossible that a man can be guilty of any wickedness, merely because he requires a longer chain of evidence to admit a proposition than another. The question that remains is, whether this definition be adequate. The consideration of this point will occupy our next essay; however, we will venture to anticipate the result, namely, that the mere deciding in favour of the greater of two probabilities, is NOT faith, in the religious sense of the word.

Some readers will ask, what use has been made of the four classes mentioned in our last essay? To which we answer, none as yet; but in considering faith, we shall move in a circle, till we meet with them again.

THE TRANSCENDENTALIST.

THREE HUNDRED MAXIMS FOR PARENTS.

(Darton and Clarke, 58, Holborn-hill. Price 6d.)

THIS is a curious little volume, and is certainly worth more than the money as a mere curiosity; but it is valuable, moreover; it contains many useful, and some very excellent precepts; but there is a third class, which is marvellous and extraordinary, beyond any thing we ever saw in print. Of this third class we shall say nothing; it refers to an unspeakable subject, of which, as an Apostle says, it is not lawful for a man to speak. We leave it to the reader to cogitate thereon, but we fear the words will disturb his own interior thoughts. The school is evidently mystic, but still there is a grain of practical truth to be found, which we have picked out:—"Let the beneficial influence of the master act upon the girl, and the soft influence of the mistress upon the boy," is bringing moral instruction home to the understanding and the feelings, which can never be divided. We recommend the principle of this precept to Shelemiah. Perhaps it, better than we, may teach him the beneficial influence of an outward circumstance. But "never let the child look outward for the ground of its conviction," would puzzle one of Daniel's angels to expound. What is a ground of conviction, that robbing a bird's nest is wrong? Our feelings? These are moved by the plaint of the injured

bird, and would not be experienced, did we not perceive symptoms of a sensitive injury. The grounds of conviction are *always* double, *outward* and *inward*, and never, in any single case, inward only, or outward only.

We consider that this little book might be made very useful, by means of the pruning knife, and a little additional graft of the understanding. The sermons of stones and trees, and actions, and circumstances, are a thousand times better than those of words. Indeed, we think a dumb parent can bring up his children as morally as a talkative philosopher. Who has not felt the eloquence, of a look, a shake of the hand, a step, a gesture, an attitude, an act? All these are outward symptoms of inward feelings. They do not deceive; words often deceive. We wish to God the moralist would endeavour to bring about a system of *dumb moral instruction*, and leave the sciences to the tongue and the pen. The author of the "Three Hundred Maxims" evidently has something of this in view, but he begins at the wrong end. We wish he had a school or a family to instruct, that his lectures might be experimental. He would find outward things more useful than he imagines.

Matter is the book of God. It is the house of God—the temple of God; and its arrangements by man are the ceremonial worship of God—now, henceforth, and for ever.

"Never venture to determine what thy child shall become, but by the inner determination find out God, who is determining it."

"It is impossible that a corrupt generation should generate a better one, without purifying itself."

"Never behave childishly to a child, but treat the child with a childlike heart."

"Let your child be alone only after having been in good company, for when it comes from worldly company, it will always be *bad* company to itself."

"Words are not at all the means of conveying ideas from one to the other, but only the means of representing ideas."

"Talk not to your child about the *motives* from which you act, but let your *actions* be in correspondence with the highest good, and the child will itself be aware of the good that is in your motives."

"Never tell the child that you act out of love, but really put so much love into the act, that the child will be sure to find it out from its *loveliness*."

"Never think that you will dispose your child by *words* to what you have indisposed it by facts."

"Never *reason* with your child on that which it should believe from divine instinct alone."

"All that is *above* the child is a subject of the child's belief."

"All that is *below* the child is an object of the child's reasoning."

"Never exhort your child to love, for a commanded love is but a lifeless image of love."

"Never exhort your child to gratitude, for thanks which are *extracted* will be patches of excess or defects."

"Never claim the attention of your child when you feel disposed to *preach* moral, but be always ready to *aid* it, when it addresses you for the sake of its moral elevation."

"As soon as the child sees that you do not care about the occupation to which its *nature* leads it, it will not care about the occupation to which you would lead it."

"Gratify not your own vanity by the exhibition of your child; let its blushing cheek be a lesson to yourself."

"Never propose to your child any character, and the least of all your own, as the model, according to which the child is to form itself."

"Do not prove to your child the truth of revelation by the miracles operated at the time of its introduction on the earth, but let the child find the *real miracle* in its own person."

"The child's spiritual nature is not bad in itself, but it becomes so if you waste it, and neglect that good which shall become the ruler of it."

"The difference between the sexes is no *inequality*, for there is not less certainty in the *feelings* of a woman than in man's *understanding*."

"Let the peculiar character of each sex be developed in the interior life, and that will better secure them than walls or doors."

"To let the peculiar character of the sexes be freely developed, you must, as much as you possibly can, bring them up together."

"Let the *beneficial* influence of the master act upon the girl, and the soft influence of the mistress upon the boy."

"Do not shut up your daughter from the exercises and liveliness which prevails in the society of boys."

"Do not shut up your son from the grace and loveliness which prevails in the society of girls."

"Do not allow the *feelings* to occupy the whole of your daughter's existence, but cultivate her understanding with relation to the Spirit."

"Do not offend the Spirit in the feelings of your daughter, by submitting them to the scourge of the *understanding*, for woman in her feelings *beholds* the Spirit which man often hardly understands."

"Surround your daughter with the sphere of *natural* existence, for the good which she will develop in an artificial existence can never be understood by her, nor any one else."

"Do not allow the understanding to be the whole of your son's existence, but direct the good in his feelings to the Spirit."

"Your son will never elevate himself above the personal tendency of *individual* truth to the *universal* tendency of moral dignity, if you do not allow the *good* in his intellectual life to be co-associated with the *good* in his feelings."

"He who is made able to see that the beauty in Nature, the Eternal Will in man, and the goodness in God make the *one great harmony*, is the *only* religious, the *only* happy man; in him the divine germ has fructified, and God's image is restored unto him, of faith, 'for Christ dwelleth in his Spirit.'"

The following are somewhat curious and equivocal:—

"Let the child arrive by degrees to the consciousness, and to the free use of his physical, moral, and divine capacities, and thereby find out how its interior vocation is related to love."—[But if by trying to *let* it you *prevent* it, what then? We should like to see this ideal education realized.]

"Let the child never witness a bad effect, without inquiring after the end that has disturbed the cause."—[We should like to see the mother who could practise this droll precept.]

"Never *give* the child a motive, but let it *find* the mover himself within its own will."—[That is, never *speak* to your child.]

"Never tell the child how it must behave to any person, but allow the child to feel its true relation to the centre, and from it find how it is to behave to all."

"Let not your child waste its moral strength in doing that which has no moral end."

"Never cause the child to make any *exterior* atonement for its transgressions, but let the voice of its conscience, confirmed by your reproof, be an *interior* atonement."—[Why an exterior action should not be treated with an exterior reaction, is beyond our comprehension.]

"If the child's moral will be too weak to produce moral action, *never punish the child*, but assist its moral nature to recover strength."—[Bachelor's children are nicely brought up. So says Mr. Owen; but neither of the two is a practical teacher.]

"Never exhort the child to anything upon the ground of example, since the same action is altogether different when proceeding from a different origin."—[Showing a good example must be equally useless; thus belying the maxim—example is better than precept.]

"Let the child freely display and fully enjoy the beauties of art in so far as they manifest the in-forming spirit, which pervades human consciousness and human freedom."—[This has mystry written on its forehead.]

"Never make great exertions to provide enjoyments for your child: cast it upon the Spirit, who will provide all that it needs—*true* enjoyments."

"To diminish the irritability of your child, let it be interiorly concentrative: for the more concentration takes place at

the centre, the less it is liable to be overcome at the circumference."—[A very good prescription for nervous people, if they could prepare it.]

"Let not your child have any other relaxation than that variety which will relate him to unity."—[It would require one of Daniel's angels to explain this.]

"Before you think of gathering exterior means for your child, take care that it gathers the interior substances for itself."—[How doth it gather them but by observation?]

THE HORRORS OF A COTTON MILL.

Extracted from MARTIN'S "*Annals of Crimes*," and reprinted by W. M. Clarke, Warwick-lane. 1837.

RECURRING to the description given me by Robert Blincoe of the dreadful state of thralldom in which, with a multitude of unvenial companions, he was involved at Litton Mill, I am instructed to say, that, as excessive toil, the want of proper time for rest and the absence of nourishing and wholesome food, gave rise to contagious disease, [so a liberal supply of good provisions and a cessation from toil quickly restored many to health; but instead of taking warning by the results of these terrible examples, no sooner were the invalids sent back to the mill than the system of over-toil, boundless cruelty, starvation, and torture, was at once resumed. Let it not, however, be supposed that anything in the shape of dainties had been dispensed to the sick: wheaten bread, coarse pieces of beef boiled down in soup, or mutton for broth, with good milk or butter-milk, sparingly distributed, formed the extent of those indulgencies. This diet, luxurious as it was considered in Litton Mill, did not surpass the ordinary standard of the daily fare that Blincoe had enjoyed at St. Pancras workhouse, as well as during the latter period of his stay at Lowdham Mill.

I have not yet done more than mention the cuffs, kicks, or scourging to which, in common with many other of his unhappy comrades, Blincoe stood exposed; since by his account, almost from the first hour in which he entered the mill, till he arrived at a state of manhood, it was one continued round of cruel and arbitrary punishment. Blincoe declared, he was so frequently and immediately beaten it became quite familiar; and if its frequency did not extinguish the sense of feeling, it took away the terror it excited on his first entrance into this den of ignorance and crime. I asked him, if he could state an average number of times in which he thought he might, in safety, say he had suffered corporeal punishment in a week. His answer invariably was, his punishments were so various and so frequent it was impossible to state with anything approaching to accuracy. If he is to be credited, during his ten years of hard servitude his body was never free from contusions and wounds, inflicted by the cruel master whom he served, by his sons, or by his brutal, and ferocious, and merciless overlookers.

It is already stated that he was put to the back of a stretching-frame when he was about eleven years of age, and that often, owing to the idleness or the absence of the stretcher, he had his master's work, as well as his own, to perform. The work being very coarse, the motion was rapid, and he could not keep up to the ends: for this he was sure to be unmercifully punished, although they who punished him knew the task assigned was beyond what he could perform! There were different stretchers in the mill; but, according to Blincoe's account, they were all of them base and ferocious ruffians: Robert Woodward, who had escorted the apprentices from Lowdham Mill, was considered the worst of these illiterate, vulgar tyrants. If he made a kick at Blincoe, so great was his strength, it commonly lifted him off the floor: if he struck him even a flat-handed blow, it floored him; if with a stick, it not only bruised him, but cut his flesh. It was not enough to use his feet or his hands; he must wield a stick, a bobby, or a rope's end. He and others used to throw rollers, one after another, at the poor boy, aiming at his head, which of course was uncovered while at work; and nothing delighted the savages more than to see Blincoe stagger, and to see the blood gushing out in a stream! So far were such results from deterring the monsters, that long before one wound had healed similar acts of cruelty

produced other wounds; so that, on many occasions, his head was excoriated and bruised to a degree that rendered him offensive to himself and others, and was so intolerably painful as to deprive him of rest at night, however weary he might be. In consequence of such wounds, his head was overrun by vermin. Being reduced to this deplorable state, some brute of a quack doctor used to apply a pitch cap, or plaster to his head. When it had been on a given time, and its adhesion was supposed to be complete, the terrible doctor used to lay forcibly hold of one corner and tear the whole sculp from off his head at once! This was the common remedy; and I should not exaggerate the agonies it occasioned were I to affirm, that it must be equal to anything inflicted by the American savages, on helpless prisoners, with their scalping knives and tomahawks.

This same ruffian, Robert Woodward, who, by the concurrent testimony of many sufferers, stands depicted as possessing that innate love of cruelty which marked a Nero, a Caligula, or a Robespierre, used, when Blincoe could not or did not keep pace with the machinery, to tie him up by the wrists to a cross-beam and keep him suspended over the machinery till his agony was extreme. To avoid the machinery, he had to draw up his legs every time it came out or returned: if he did not lift them up, he was cruelly beaten over the shins, which were bare. Nor was he released till, growing black in the face, and his head falling over his shoulder, the wretch thought his victim was near expiring! Then, after some gratuitous knocks and cuffs, he was released and instantly driven to his toil, and forced to commence with every appearance of strength and vigour, though he were so crippled as to be scarcely able to stand. To lift the apprentices up by the ears, shake them violently, and then dash them down upon the floor with the utmost fury, was one of the many inhuman sports in Litton Mill, in which the overlookers appeared to take delight: frequently has Blincoe been thus treated, till he thought his ears were torn from his head; and this for very trivial offences or omissions. Another of their diabolical amusements consisted in filing the apprentices' teeth! Blincoe was once constrained to open his mouth to receive this punishment, and Robert Woodward applied the file with great vigour! Having punished him as much as he pleased, the brute said with a sneer—"I do this to sharpen thy teeth, that thou mayest eat thy Sunday dinner the better."

Blincoe declared, that he had often been compelled, on a cold winter's day, to work naked, having no covering on him besides his trousers, loaded with two half-hundred weights slung behind him, hanging one at each shoulder. Under this cruel torture he soon sunk, when, to make the sport last the longer, Woodward substituted quarter-hundred weights, and thus loaded, by every painful effort, Blincoe could not lift his arm to the roller. Woodward has forced him to wear these weights for hours together, and still to continue at his work! Sometimes he has been commanded to pull off his shirt and get into a large square skip, when the savage, being sure of his mark, and that not a blow would be lost, used to beat him till he himself was tired! At other times Blincoe has been hoisted upon other boys' shoulders, and beaten with sticks, till he has been shockingly discoloured and covered with contusions and wounds.

What spinners call a *draw off*, at one of those frames at which Blincoe worked, required about forty seconds: Woodward has often insisted upon Blincoe cleaning all the cotton away under the whole frame in a single draw, to go out at the farther end, under pain of a severe beating. On one of these occasions Blincoe nearly lost his life: being caught between the faller and the head-piece, his head was jammed between them. Both his temples were cut open, the marks of which are still to be seen, and the blood poured down each side of his face! It was considered next to a miracle that he escaped with his life. So far from feeling the least compassion, Woodward beat him cruelly, because he had not made *more haste*! Blincoe says to the best of his recollection, he was twelve years of age when this accident happened!

It is a fact too notorious to be denied, that the most brutal and ferocious of the spinners, stretchers, rovers, &c., have been in the habit, from mere wantonness, of inflicting severe punishments upon piecers, scavengers, frame-tenters, winders, and others of the juvenile class subjected to their power, compelling

them to eat dirty pieces of candle, to lick up tobacco spittle, to open their mouths for the filthy wretches to spit into; all which beastialities have been practised upon the apprentices at Litton Mill! Among the rest, Blincoe has often suffered these indignities. What has a tendency to display human nature in its worst state, is, that most of the overlookers, who acted thus cruelly, had arrived in the mill as parish apprentices, and, as such, had undergone all these offensive inflictions!

There was, however, one diversion which, in all my inquiries as to cotton-mill amusements, I never found paralleled: of this, Robert Woodward, if I mistake not, has a claim to the honour of being the *original inventor*. It was thus executed—A tin can or cylinder, about three feet high, to receive the rovings, and about nine or ten inches in diameter, was placed in the midst of the alley or wheel-house, as the space is called, over which the frames travel at every draw, and pretty close to the race. Upon this can or hollow cylinder Blincoe had to mount, and there to stand upon one foot, holding a long brush extended in the opposite hand, until the frame came out, about three times in two minutes, invariably knocking the can from under him, when both fell upon the floor! The villain used to place the can so near the race that there was considerable danger of Blincoe falling on it; had he done so, it would probably have lamed him for life, if it had not killed him on the spot: the victim had, with the utmost celerity, to throw himself flat upon the floor, that the frame might pass over him! During this short interval, the amateurs (Robert Woodward, Charnock, Merrick, &c.) used to set the can upright again; and it required no small share of ingenuity in them to keep time. The frame being returned, poor Blincoe had to leap on his feet, and again to mount nimbly on the hollow column of tin, again to extend his arm, holding the long hair brush, and again sustain a fall, amidst the shouts and yells of these fiends! Thus would the villains continue to persecute and torment him, till they were tired, notwithstanding the *sport* might have been his death. He ran the risk of a broken bone, or the dislocation of a limb, every time he was thus thrown down; and the hours the monsters thus wasted, they afterwards made up by additional labour wrung from their wretched victims!

Another of their diversions consisted in tying Blincoe's hands behind him, and one of his legs up to his hands: he had then only one leg left free to hop upon, and no use left of his hands to guard him, if he chanced to fall; and if Blincoe did not move with activity, the overlooker would strike a blow with his clenched fist, or cut his head open by flinging rollers: if he fell, he was liable to have his leg or arm broken or dislocated. Every one conversant with cotton-spinning machinery knows the danger of such diversions; and of their cruelty, every one can judge.

There seemed to exist a spirit of emulation—an infernal spirit, it might with justice be designated—among the overlookers of Litton Mill, to invent and inflict the most novel and most singular punishments. For the sake of being the better able and the more effectually to torment their victims, the overlookers allowed their thumb and fore-finger nails to grow to an extreme length, in order that, when they pinched their ears, they might make their nails meet—marks to be seen!

Needham himself, the owner of the mill, stands arraigned of having had the cruelty to act thus, very frequently, till their blood has run down their necks; and so common was the *sport* it was scarcely noticed. As it regarded Blincoe, one set of wounds had seldom time to heal before another set was inflicted; and the general remedy that Blincoe applied was the oil used for the machinery. The despicable wretches who thus revelled in acts of lawless oppression would often, to indulge the whim of a moment, fling a roller at a boy's head, and inflict deep wounds; and this, frequently, without even a shadow of a fault to allege, or even a plausible reason to assign in *justification*! At another time, if the apprentices stood fair for the infliction of a stripe, with a twig or the whip, the overlookers would apply it, with the utmost vigour, and then, bursting into laughter, call it a—*good hit*! Blincoe declared he has, times innumerable, been thus assailed, and has had his head cut severely, without daring to complain of the cause. Woodward and others of the overlookers used to beat him with

pieces of the thick leather straps made supple by oil, having an iron buckle at the end, which drew blood almost every time it was applied, or caused severe contusions.

Among Blincoe's comrades in affliction was an orphan boy, who came from St. Pancras workhouse, whose proper name was James Nottingham; but better known as "*Blackey*," a nickname given him on account of his black hair, eyes, and complexion. According to Blincoe's testimony, this poor boy suffered even greater cruelties than fell to his own share! By an innumerable number of blows, chiefly inflicted on his head! by wounds and contusions his head swelled enormously, and he became an idiot! To use Blincoe's significant expression, "*his head was as soft as a boiled turnip! the scalp on the crown pitting everywhere on the least compression.*" This poor boy, being reduced to this most pitiable condition by unrestrained cruelty, was exposed to innumerable outrages, and often plundered of his food, and was at last incapable of work. Melancholy and weeping, he used to creep into holes and corners, to avoid his tormentors. From mere debility he was afflicted by incontinency of stools and urine! To punish this infirmity, conformably, as Blincoe declared, with the will of Ellice Needham, the master, his allowance of broth, buttermilk, porridge, &c., was withheld! During the summer time, he was mercilessly scourged! and in winter he was stripped quite naked, and slung, with a rope tied round his shoulders, into the dam, and dragged to and fro till he was nearly suffocated. They would then draw him out, and set him on a stone, under a pump, and pump upon his head, in a copious stream, while some stout fellow was employed to sluice the poor wretch with pails of water, flung with all possible fury into his face. According to the account I received, not alone Blincoe, but several of the Litton Mill apprentices, when these horrid inflictions had reduced the poor boy to a state of idiotism, his wrongs and sufferings, his dismal condition, far from exciting sympathy, only increased the mirth of these vulgar tyrants! His wasted and debilitated frame was seldom, if ever, free from wounds and contusions; and his head, covered with running sores and swarming with lice, exhibited a loathsome object! In consequence of this miserable state of filth and disease, poor Nottingham has many times had to endure the excruciating torture of the pitch and scalping-cap already noticed!

Having learned, in 1822, that this forlorn child of misery was then at work in a cotton-factory near Oldfield Lane, I went in search of and found him. At first, he seemed much embarrassed; and when I made inquiries as to his treatment at Litton Mill, to my surprise, he told me "he knew nothing whatever about it." I then related what Blincoe and others had named to me, of the horrid tortures he endured. "I dare say," said he, mildly, "he told you truth, but I have no distinct recollection of anything that happened to me during the greater part of the time I was there! I believe," said he, "my sufferings were most dreadful, and I nearly lost my senses." From his appearance, I guessed he had not been so severely worked as others of the poor crippled children whom I had seen: as well as I can recollect, his knees were not deformed, or, if at all, but very little! He is much below the middle size, as to stature; his countenance is round; and his small and regular features bore the character of former sufferings and present tranquillity of mind. In the course of my inquiries respecting this young man, I was much gratified, by hearing the excellent character given him in the vicinity of his lodging. Several persons spoke of him as being serious and well inclined, and his life and conduct as being irreproachable.

We frequently, said my informant, had our best dinner on a Sunday, and it was generally broth, meat, and turnips, with a little oat-cake; the meat was of as coarse a sort as could be bought. This being our extra dinner, we did not wish to part with it too soon; therefore it was a general practice among the apprentices to save some of it till Monday, leaving it in the care of the governor of the apprentice-house, each one to know his own: the practice was to cut some mark in the oat-cake, and lay it on the wooden trencher. It happened one Sunday we had our dinner of bacon, broth, and turnips, with a little oat-cake: this Sunday, Thomas Linsey, a fellow apprentice

thought he should like a snack early in the morning; he, therefore, took a slice of bacon between two pieces of oat-cake to bed with him, and put it under his head—I cannot say, under his pillow, because we never were allowed any. The next morning, about three or four o'clock (as it was a usual practice in the summer time, when short of water, for a part of the hands to begin their work sooner, by which contrivance we were able to work out our full time, or nearly so), Linsey was found dead in bed; and as soon as some of the apprentices knew of his death, as they slept about fifty in a room, there was a great scuffle who should have the bacon and oat-cake from under his head: some began to search his pockets for the tin he used to eat his victuals with; some had pieces of broken pots, as no spoons were allowed! It was reported that this Sunday's pig had died in the Lees, a place so called at the back of the apprentice-house. There was no coroner's inquest held over Linsey to know the cause of his death. I shall leave the reader to judge for himself this distressing sight, at so early an hour in the morning. This occurred at Litton Mill.

It might be supposed that these horrid inflictions had been practised in Litton Mill unknown to the master and proprietor; but the testimony, not of Blincoe alone, but of many of his former associates, given without his knowledge, is decisive on this point: the latter, like Blincoe, described Ellice Needham, the master, as equalling the very worst of his servants in cruelty of heart! So far from taking any care to stop their career, he used to animate them by his own example to inflict punishment in any and every way they pleased. *Mr. Ellice Needham* stands accused of having been in the habit of knocking down the apprentices with his clenched fists, and kicking them when down; beating them to excess with sticks, or flogging them with horse-whips; seizing them by the ears, lifting them from the ground and forcibly dashing them down on the floor, or pinching them till his nails met! Blincoe declares his oppressors used to seize him by the hair of the head, and tear it off by a handful at a time, till the crown of his head had become as bald as the back of his hand! *John Needham*, following the example of his father, and possessing unlimited power over the apprentices, lies under the imputation of crimes of the blackest hue, exercised upon the wretched creatures from whose laborious toil the means of supporting the pomp and luxury in which he lived were drawn. To the boys he was a tyrant and oppressor! To the girls the same, with the additional odium of treating them with indecency as disgusting as his cruelty was terrific: these unhappy creatures were at once the victims of his ferocity and lust!

For some trivial offence, Robert Woodward once kicked and beat Robert Blincoe till his body was covered with wheals and bruises. Being tired, or desirous of affording his young master the *luxury of amusing himself* on the same subject, he took Blincoe to the counting-house and accused him of wilfully spoiling his work! Without waiting to hear what Blincoe might have to urge in his defence, young Needham eagerly looked about for a stick: not finding one at hand, he sent Woodward to an adjacent coppice, called the Twitchell, to cut a supply, and laughingly bade Blincoe strip naked, and prepare for a *good flanking!* Blincoe obeyed; but, to his agreeable surprise, young Needham abstained from giving the promised flanking! The fact was, the poor boy's body was so dreadfully discoloured and inflamed by contusions, its appearance terrified the young despot; and he *mercifully* spared him, thinking that mortification and death might ensue if he laid on another "flanking." Hence his unexpected order to Blincoe to put on his things! There was not at the time a free spot on which to inflict a blow! His ears were swollen and excoriated; his head was in the most deplorable state imaginable; many of the bruises on his body had suppurated; and so excessive was his soreness, he was forced to sleep on his face, if sleep he could obtain in so wretched a condition!

Once a-week, and generally after sixteen hours of incessant toil, the eldest girls had to comb the boys' heads, an operation that, being alike painful to the sufferer, and disgusting to the girls, was reluctantly endured and inefficiently performed: hence arose the frequency of scald heads, and the terrible scalping remedy! Upon an average, the children were kept

to work during a great part, if not all, the time Blincoe was at Litton Mill, sixteen hours in the day: the result of this excessive toil, superadded to hunger and torture, was the death of many of the apprentices, and the entailment of incurable lameness and disease on numerous others.

The store pigs and the apprentices used to fare pretty much alike; but when the swine were hungry, they used to squeak and grunt so loud that they obtained the wash first, to quiet them: the apprentices could be intimidated and made to keep still. The fattening pigs fared most luxuriously, compared with the apprentices! They were often regaled with meal-balls made into dough, and given in the shape of dumplings! Blincoe and others, who worked in a part of the mill whence they could see the swine served, used to say to one another—"The pigs are served; it will be our turn next." Blincoe and those who were in a part of the building contiguous to the pigsties, used to keep a sharp eye upon the fattening pigs and their meal-balls, and as soon as he saw the swineherd withdraw he used to slip down stairs, and, stealing slyly towards the trough, plunge his hand in at the loop-holes, and steal as many dumplings as he could grasp! The food thus obtained from a pig's trough, and perhaps defiled by their filthy chops, was exultingly conveyed to the privy or the duck-hole, and there devoured with a much keener appetite than it would have been by the pigs: but the pigs, though generally esteemed the most stupid of animals, soon hit upon an expedient that baffled the hungry boys; for the instant the meal-balls were put into their troughs they voraciously seized them, and threw them into the dirt, out of the reach of the boys! Nor this alone: made wise by repeated losses they kept a sharp look out, and the moment they ascertained the approach of the half-famished apprentices, they set up so loud a chorus of snorts and grunts, that it was heard in the kitchen, when out rushed the swineherd, armed with a whip; from which combined means of protection for the swine, this accidental source of obtaining a *good dinner* was soon lost! Such was the contest carried on for a time, at Litton Mill, between the half-famished apprentices, and the well-fed swine.

I observed to Blincoe, it was not very rational to rob the pigs, when they were destined to bleed to supply them with food as soon as they grew sufficiently fat! "Oh! you're mistaken," said he, "these pigs were fatted for master's own table, or sold at Buxton! We were fed upon the very worst and cheapest of Irish-fed bacon." There was, it seems, a small dairy at Litton Mill; but the butter was all sent to his house: the butter-milk alone was dispensed, and but very scantily, to the apprentices. About a table-spoonful of meal was distributed once a-week to the apprentices, with which to wash themselves, instead of soap; but in nine cases out of ten it was greedily devoured, and a piece of clay or sand, or some such thing, was substituted: such was the dreadful state of hunger in which these poor children were kept in this mill.

TO CORRESPONDENTS.

The disguised and unfeeling Toryisms of Shelemiah's letter is such, that we cannot insert it. We are exceedingly sorry to think that a good disposition, which the writer evidently possesses, should be so strangely perverted by a neglected understanding. We doubt not that the writer means well, but his letter would be much better suited for the Church of England Magazine, or perhaps the Evangelical Magazine, than a paper like ours, whose object is to lead the understanding to outward action, and not to set the soul asleep with bewildering phantasms. To satisfy the reader, we will quote two passages:—
"From the existence of the realities thus imperfectly hinted at, we observe, that it is utterly useless to propose to the people good circumstances, before they themselves are constituted good moral beings; at all events, the first attention should be given to the being, and not to his circumstances."
"If the people do not make good conditions, they have not the better nature." Can such ignorance pretend to teach? Does not Shelemiah know that we devote all the attention to the being; the circumstances are used for the sake of the being, and for his sake only.

THE CHRIST.

"The path of the just is as the shining light which shineth more and more unto the perfect day."

Di lui si fècer poi diversi rivi
Onde l'orto Cattolico si riga
Sì che i suoi arabuscelli stan più vivi.

Dante, Paradiso, c. 12.

From him do many streamlets go,
That o'er the Catholic garden flow,
The little trees more lively grow.

All nations are familiar with the idea contained in this word. It is a divine and complete deliverer. But there is a vagueness about creeds of churches and individuals, respecting this deliverer, which requires a few more observations.

All power (and Christ is a power,) naturally and simply, divides itself into physical, intellectual, and moral. The physical, being the lowest, is first developed; the moral, is the end and object of all government. Intellect may be largely developed under an immoral system.

Saint Augustin, had a similar view of Nature, when he divided Vision into three kinds: *corporalis, spiritalis, and intellectualis*. But his definition of "intellectualis," corresponds to our "moral." He illustrates it by the precept, "love thy neighbour." The sight of these words, is the corporal vision, and has no moral virtue. The remembrance of these words, or the image of the precept in the mind, is the spiritual vision, also without virtue; but the "love" itself, is the "*intellectualis*," or the conscious love feeling. This word has now assumed a different meaning; but it is evident, that St. Augustin and we are treating of the very same divisions of being, under different names. There is no other division to think of. Words may change; but the universal facts, are eternally the same. The revelation of these eternal facts in time, is man's sphere of inquiry and his school for wisdom.

This is the natural progress of growth: Christ being the new creator, or governor of society, the overturner of the old, and the builder of the new government, according to the law of nature, has a threefold development.

First—The physical or bodily Christ, or Christ in humiliation, a worker of bodily miracles—possessing the authority derived from such miracles; a preacher of righteousness, but only a preacher, not exercising any delivering power in renewing the moral nature of man, or ameliorating the condition of society—a mere material Christ—God manifest in the flesh, handled and seen, but not enjoyed, bringing death to himself, and to all that followed him.

Second—We have the spiritual or intellectual Christ; that is the doctrinal Christ of theologians; whose nature has been discussed, analyzed, and depicted with all the ingenuity and skill of man, in whose cause the most profound learning, and the most marvellous talent, have been employed for many successive generations. This Christ is the ruling Christ of the churches and creeds of Christendom. He is the spirit and power of the former, and is discovered in the former, and his being and character are deduced from the former. He is much

more exalted. The other was in humility, this in exaltation and glory. The other was a local being. This is supposed to have an omnipresent being. It is the omnipresence of this spiritual Christ which forms the basis of transubstantiation, and as a man who tastes one drop of sea-water tastes the whole sea, and one who inhales a small portion of atmosphere knows the virtue of the whole, so he who takes the consecrated host, takes the whole logos in a partitive sense. This spiritual Christ, we say, is an extension of the former. But it is not the final fruit. It has produced division, and has not yet redeemed the world according to promise. Still, the work of germination and Christ's growth is going on—another stage is yet to come, and that third stage is the moral re-union of all the scattered fragments which the intellectual power has dispersed.

Intellect is naturally a contentious power; argumentative people are always quarrelsome. There is no satisfying their hypercritical nicety. Excellence, with them, seems to consist in an assent to certain propositions, or a submission to certain intellectual formulas. Hence the origin of creeds, which are all the offspring of this intellectual Christianity, and are all fruitless in a moral sense, and utterly deficient in attaining the object originally aimed at. When we consider that *the Christ* is at present only in his second or middle stage of progress, this is not to be wondered at. It is a fall—the fall of man—and the depth of the fall is increased in proportion to the number of professors, or the number of minds, which regard the intellectual assent as a criterion of worth, and hope to reform mankind by metaphysical arguments. This is Anti-christ. It is the fall or humiliation of the Christ in his spiritual offspring. We were told it would so be, and so it has been, and seems still to be going on; men still vainly hoping by means of Antichrist and his intellectual wranglings, to save themselves both here and hereafter.

Third—The moral, or perfect Christ.—This is the consummation of the progress of the church, and it becomes a perfect unity when it arrives to this state. Jesus of Nazareth, the seed germ, or type, of this great and universal Christ, was a perfect and upright man; an individual image of the universal Christ to be revealed in the world, and in man at a future period. He was a God-man, and a worker of wonderful works, by means of the Godhead revealed in him. The third revelation of the Christ in the universal man, or men collectively, will produce greater perfection than his, and do greater works. Moreover, it will do what has never been done before, it will redeem society. "The kingdoms of this world shall become the kingdoms of our Lord, and of his Christ; and we (the people) shall reign on the earth."

From this view of *the Christ*, it is evident enough, that his final revelation has not yet taken place; that that final revelation is a moral re-union of society knit together as one man, and beautiful in moral excellence and in *healing* power, even as Christ the individual type is represented to have been.

This latter idea of Christ is the universal Christ, or the true Saviour—the former only save nominally, as heralds, or forerunners of the latter. The Individual, or physical Christ, healed physically; the spiritual Christ heals ideally in the imaginations of the devout; but neither of the two produces the

real fraternal charity or love, which alone sufficeth to cure the diseases of society. They are therefore insufficient saviours; and the systems erected upon them, are what the Scriptures call Antichrist, or in other words the Division of the Church and the hatred and repulsion of its members. Hence the spirit of the age has a tendency to cast them off. Infidelity takes this leap out of the pale of the Church, and sets up a tabernacle of its own without the gates. Infidelity errs in doing so, not because it is wrong in denying that the corporeal Christ, or the spiritual Christ, has failed to fulfil the promise of deliverance, for in this denial infidelity is right; not because it is wrong in denying that the doctrinal creeds about the spiritual Messiah of the Church are erroneous, for in this also infidelity is correct; but it errs in not perceiving the process determined upon in the councils of Providence, as the natural growth of the Christ from one individual perfect man, up to one universal perfect man. There is no occasion for going out of the pale of the Church; the duty of every man, now is, to complete the universal man by a re-union of fraternity, and thus reveal the Godhead in society by the creation of universal brotherhood. The spirit of this universal brotherhood is God the Son.

In the progress from the individual to the universal Christ, we see the fall of man beautifully, or rather awfully, developed. Like the first Adam, the second Adam was perfect. He could not be otherwise. He was free. He was under no law. He was the son of the woman. When Adam was put in the garden, he also was blameless; but Adam was put under a law, he was made a bondman. Being made a bondman, he fell; for every man who is under an outward law will break it. He is a fool if he do not. Adam was no fool in this respect; he ate of the tree of knowledge. Evil increased after him, in proportion as his children multiplied, as intellect and interests multiplied. A grand system of outward law was set up; sacrifices and types of outward forms, wooden gods, stone gods, a vast temple of outward things—the world of the bondman and his children. Oracles and prophets were sent to keep it up, and they kept it up till Christ came, and then they gradually ceased.

Now who was Christ? a new man altogether. A man who was not under the law, and could not commit sin, because he was not under the law, and for that reason only. The seed of the woman was free. His law is the law of love, not an outward law. He is a perfect sovereign, an irresponsible being. God himself never will, and never can, call him to account. He is not the son of knowledge, like the man of the tree, but the son of the heart. This new man begets children, not as the first Adam, but by a spiritual relationship; and all who are united with him in spiritual relationship, that is, by acknowledgment of his sonhood, his freedom, are themselves free, and under the law of love; but they who do not acknowledge him, are sons of the bondman; they are miserable, contentious devils, hating one another, and persecuted by the universal spirit till they acknowledge the Son.

But how can or must they acknowledge him? Only as one member of a body acknowledges another—by the closest union, the most perfect possible relationship, unity of interest, unity of possession, perfect sympathy, and mutual confidence—the COMMUNION of the Saints. They must be able to repeat, with godly sincerity, and without hypocrisy, "I believe in the Holy Catholic Church, the communion of the saints." If they cannot repeat this from the conscience, without a quaver, without demurring, without a mental reservation, they are impostors and deceivers, wolves in sheep's clothing—antichrists. We care not for their creeds: we look to their hearts, and their reception of the Son of the Woman.

There is the whole gospel of the Son of God compressed in a nutshell! Let Christendom refute it, either by Nature or revelation, if it can.

Now you may call this a *mythos*, if you like. You may call it a fable; still it is a truth, a true fable, a true *mythos*, but more perfect as a history; and the brotherhood of love and

friendship is the true brotherhood; so true, that marriage, the type of Heaven, is interdicted between blood relations.

Well, we have seen the advent of this new man, this son of a woman, who is the type of love, as man is the type of intellect. He teaches a new law, the law of love. He teaches the doctrine of salvation by himself alone, the representative of love. He teaches unity with himself, as an irresponsible being, under no other law but the law of love; and he teaches unity with one another, as the subjects of love; and he promises, darkly promises, salvation, and disappears. Bodily he is not a Saviour; he has gone; but his spirit abides in the Church. The time has not yet come for organizing the universal Church. It has to learn what Christ is *not*, before it discovers what Christ is. The intellect is therefore developed. Disputation commences about what Christ is; some call him a man, with the universal Deity in him! some say a portion of the Deity! These two fight. Another arises, and says he was merely an *eon*, that is, a *being*, an archangelic being. Some say he was created; others, uncated. Some maintain that he existed before he was born, or conceived; others deny it. Some say he had red hair, others say sandy-coloured; and others, no doubt, believe his hair was black and comely! All these hate each other. Then they begin to investigate the nature of the relationship between the Son and the Father. Some say he is eternally *being* begotten; others say that he was begotten from eternity, and *not* eternally being begotten. These are furious opponents, and doom each other to perdition. Then they discuss the process of sanctification by the Spirit. Some say the water of baptism regenerates; others deny this. Some say sprinkling will do; others maintain that there must be a complete immersion. Some say children may be baptized; others say adults only. Then they discuss the presence of Christ in the eucharist. Some say bodily, others spiritually; some totally, others partially. All these abominate each other. The reader may imagine a thousand more extravagances. All this constitutes the grand apostasy. Still it is necessary that this process be gone through, because, if these questions were not thoroughly investigated by the human mind before the moral of Christ's salvation were adopted, they would destroy the moral entirely, and introduce war in Heaven. Indeed, they have done so already, for the Christian Church began with community, but was obliged to give way to the intellectual spirit which set the whole communion of the saints in uproar.

This intellectual strife is now dying. Religious controversy has been tamed. Experience has convinced the majority that intellectual Christianity is the devil. Many throw off Christianity, and the name of Christ. They wrong Christ and Truth itself by doing so, and they shall not prosper. Christ is the heir, and to him and to his alone can the earth belong: "All kings shall fall down before him, all nations shall serve him."

What, therefore, is the next process—the final act of receiving the son of the woman in spirit and in truth? *There is no other mode but the entire absorption of the selfish in the social feelings, giving up all and following Christ.* Go back to him whom you have left; "Turn ye! turn ye! why will ye die?" It is in vain to seek Christ in yourselves individually. That is not Christ, it is the devil; it is antichrist. You can only see Christ in one another. It is the *mutual* feeling that binds society together, and makes all, "The one." Our Transcendentalist has been seeking the one intellectually; and cleverly he has ranged the woods of infinity in search of it. Where he meant to place it we know not; but here is our *one*, here is our saviour—the moral sympathy between man and man, the communion of the saints; not the communion in yourself individually, whilst you are quibbling, and wrangling, and debating about infinities, and eternities, and formulae of logic, and diving into Hell's deep profound in search of him who is unsearchable, daring the father's frow by attempting a self correspondence with him; not the mystic communion of a *solitaire*, who, in selfish retirement from the members of his body, his flesh and his bones, affects the attainment of a new and regenerate nature, amid the social ruins of society, and the dismemberment of his species. No, no; "The one" is full communion. Realize it bodily, and leave the rest to God. He will come and dwell

with you. Build him a temple; not a stone temple, but one of flesh, and you will soon find a spirit, who will visit it. You want the spirit *first*, do you? It is time enough to seek the priest, when you have provided the temple.

But yet it must be a temple. We do not want a factory, a theatre, a public-house, or a farm-house. We want a temple. There must be a provision for the religious feeling. This is the work of the intellect, and this is the use we make of the intellect at present in maintaining the necessity for the reception and acknowledgment of the son of the woman. This is all that is necessary. By this acknowledgment you declare that you build a house for God. Your house becomes a temple.

But then the mystic comes forward and tells us he has already God within him, and he sees his beauty and his glory in solitude. Then let him be content with his God. He will never save him; but he will bewilder him; he will play with him, even as a cat playeth with a mouse, and eternally deceive him with the riddles of omniscience.

And the intellectual Christian, who is the opposite extreme, will contend that this doctrine is right, and that is wrong; that we are saved by faith, or saved-by works; that prayer should be uttered with the lips, loud, long, and tuneful; that we should pray kneeling or standing, and never sitting, with a thousand other absurdities. Such a man cannot enter the temple of God. He is a Canaanite, one of the old inhabitants of the land. Let him pray till his knee bones are bare, he will rise a greater child of the devil than before.

But what will become of the sacraments? They will all be held sacred and dearer, dearer than ever. They will be *consummated*. What is the Lord's Supper but the *communion*? The English Church holds it monthly, and the Scotch Church half-yearly, and in some places it is held yearly, and a shabby blasphemous institution it is! an insult to the name of Christ! We will hold it *without ceasing*. Ours will be an *everlasting communion*, and the literal body of the Lord himself, the God of love will be there, and we will eat it, and we will drink it, and *know* that it is he. We will need no books, and sermons, and critical exercises to prove it. And baptism shall be there, and whenever a man enters the Church by baptism he will be regenerated, for he will have been translated from self-love to the communion of the church, by which alone regeneration is effected.

These are sublime and magnificent truths, truths that will stand every test. We call them omnipotent. They will conquer at last. We know it. They are laws of Nature—universal facts, rapidly progressing towards a public manifestation. They are partially taught in every Christian country, and portions of them constitute the peculiar feature of every system of reformation. But they can only be fully brought out by a Christian, for, without the name of Christ, they never can have even an ideal being. The very idea of such a system, is a temple for the name of Christ to enter. He cannot be excluded. He rushes in like air into a vacuum. The philosophy of Christianity is a necessary ingredient of community. With Christianity community is indeed divine. Without it we leave it to its fate—we shall never enter it. But those who do shall have our good wishes, and we shall always rejoice in their happiness. They may improve their condition, and find reason to rejoice that they have forsaken the atmosphere of selfishness for a more genial clime. To us a mere improvement of condition is a paltry consideration. Eating, drinking and sleeping, we hope to procure in the old world, and if we cannot find food for the hungry soul, and drink for the spirit that thirsteth, we will remain where we are.

MYSTICISM AND CO-OPERATION.

"We have enlightened the world, you know. That devil's crew, they pay no attention to rule. We are so wise,—and Tegel is haunted, notwithstanding!"—*Goethe's Faust*.

Co-operation is the lowest and most outward birth of mysticism. Yet co-operation, like many other children, before it has arrived at years of maturity, disavows its parent, and wishes

to cut off all connection with its origin. When it shall have grown a little older it will arise and return to its father, and, falling upon his bosom, say—"I have sinned against the truth, and have acted in opposition to your influence, and I fear you will not re-accept me."

Measuring age, not by a progress in time, but by progressive education, by mental activity, by the growth of consciousness, the mystic fulfils his duty by promoting that development, and by the kind of agitation these observations may excite.

In all written works on the subject of a co-operative state of society, from Robert Owen, and other modern advocates, there is at their root an unreserved avowal of a horror of all mystery. The mottoes, the heads of chapters echo this feeling, "*without mystery*, or fear of man," and the like expressions. There seems also to be some mental connection, in the writer's vision, between mystery and every error which the world has yet exhibited. At all events, they draw closely together the doctrine of responsibility and mystery.

I think we should advance the good cause by an inquiry of the nature pointed out in the assertions made above. If the ignorant disciples, and formal imitators of mystics, find in their mental position a difficulty in acceding to co-operative practices, while the co-operator meets his greatest stumbling-block in the existence of mysteries, and it be true that these two apparently opposites are related as I assert, a better thing could not be done than to make such relation evident. Let us try.

The oldest mystic of whom we have any authentic personal record, is, I think, Pythagoras. Of his deeply mystic state there can be no doubt on the mind of any man who takes the pleasure of looking into the subject. Those who have not so done, will conclude, from common report, that he was full of dark sayings, and of truths and facts folded over by double language from the comprehension of the idle vulgar.

Well, then, what says history of his opinion of social forms, and of his practice? Did not he and his disciples make one common stock of their worldly wealth? When any rebellious, or unworthy, or unteachable pupil, exhibited his true character, the community expelled him, giving him double the amount of wealth he had brought into the general fund. The turning out, I am aware, was not a co-operative mode of amending the bad, but external co-operation was not the primary design of the school. I am now only endeavouring to show that the tendency of mysticism has always been in a direction quite away from individual acquisition of wealth; and, consequently, so far in the direct road to a co-operative state of society. By and by I think I shall show, that by mystics alone can a truly and permanently just state, a co-operative, united, harmonious form of society be carried into practice. That none but mystics ever have entertained the idea in a lively manner; that none but mystics have made any approximation to it in practice; that none but mystics or their descendants are now living in such a state, and that as they recede from mysticism, they recede also from co-operation.

The most eminent and famous mystics of the western world have been Plato and Jesus Christ. Need I write one single word to show that both these were the most hearty co-operators in thought, word, and disposition, that ever opened a truth to mankind? Yet where shall we find a greater mysticism than in the words of both?

Co-operative publications frequently contain comparisons of Plato's doctrines and designs, with those of Robert Owen. Mr. Owen himself acknowledges the expansive idea and sublimity of Plato's Republic, his educative views, his moral principles. Plato's Republic, and Owen's Co-operation, are too similar in outward form to justify an advocate for the birth and adoption of the New Moral World, to cry down mystery, or mystics, without further consideration. Yet mysteries and mystics are constantly exclaimed against by this party, as strongly as by the clerical advocates for the continuance of the old immoral world.

The co-operator will reply by showing that neither Platonism, nor Christianity, nor mysticism in any form, has yet produced a communal or co-operative society, or in any way evolved a decently comfortable state of existence. Which position is true, or nearly so. Not, however, because mysticism, or the

Platonic, or Christian life, would not develop it, but because there have been too few mystics, or Platonists, or Christians.

Does not every one who opens his mental eyes perceive that "Christianity is yet nowhere?"* Scriptural, as well as non-Scriptural men, are in this perception and admission. No one is now so inconsiderate as to condemn the Christian mysteries, because pretended Christians act in opposition to them. No one will argue against the soundness of Mr. Owen's doctrines, merely because of the many tradesmen who admit their truth and justice, not one is found to carry them out into practice.

All that I am called upon to show, is, that the decided tendency of mysticism is towards the most just and true forms of society. Indeed, it must necessarily be so. Mystic being only another expression for a man who acts in obedience to justice and truth; the form of society wherein such men have sway is as consequently just and true as the human skin is the shape of the body it enveloped.

Be it remarked, however, that I do not admit any yet proposed co-operative scheme as the just and true form. I am, of course, for leaving the form to be manifested by the existence; conceiving, that to prepare a form first, and to seek the animating spirit afterwards in such form, is no less absurd than to look into empty egg-shells for the chick-germ.

Take it which way you will, either that a mystic must necessarily act justly and truly, or that a just and true man is necessarily a mystic, my position is, I hope, perceived, if not proved, that by mystics alone can the new moral world be exemplified.

I also say that none but mystics ever have held communal ideas, or have attempted to practice them. Not mystics according to the above definition only, but also according to the ordinary acceptance. I will refer to the whole history of the commercial spirit, from the earliest times until the present, as a demonstration that the kind of mind which is farthest removed from co-operation, is also at the greatest distance from mysticism. Those men, who have stood high on the royal exchange of life, have been the greatest hinderances to both mystic and co-operative progress. The perpetual recurrence of "What shall I get by it?" acts not more mortally against the latter than against the former. Whether by their own direct force, or the influence of their brilliant and tinsel example to the minds of weaker men, the self-acquisitive in commerce, in war, in fame, have been the great obstacles to human improvement. Not because they were mystics, for mystics cannot have such propensities, and dare not have such pursuits.

On the other hand, observe, the great number of communities, small and great, which the Roman Catholic mysteries evolved. It is no answer to say, that a life of celibacy was so large a fault as to abrogate all their advantages. I am not caring to show their perfection, nor even their propriety. All I wish is to show, that the principle of community, of brotherly love, of the New Moral World, is incomprehensible by any other than the mystic mind. In the degree that he is mystic, is it comprehensible. Of Mr. Owen himself I would say, so far as he is conscious of his work, he is a mystic. He hesitates not to declare that few or none understand him, even among his immediate supporters. Is he not, then, a self-acknowledged mystic?

In proportion as this ancient feeling of universal, unselfish justice died away, nunneries and priories diminished, or were turned to bad purposes, by those who were more enlightened and scientific. Not knowing, not caring to know, anything of the true basis of such establishments, modern intellect suffers their decay.

Net that I mean to be understood as upholding the mental condition of these religious communities. The inmates themselves, generally speaking, were not conscious of the universality which lay at the bottom. The possibility of such an accident happening to a co-operative community is not inconceivable, just as the modern free-mason has fallen out of that bond of unity which held his predecessors, and has become a mere conventionalist. Still, these examples, and many more which could

be adduced, serve strikingly to show, that, unless the mysticism exist in some degree or other, unless the deep inward feeling reigns throughout the man's being and conduct, it must be at least acknowledged as a reality, or co-operation cannot be substantiated. I will not go the length of saying it is a vain attempt, because it is difficult to prove a negative; but I appeal to recorded facts, I refer to the abortive attempts of our own time; and still more, I appeal to every man and woman to search themselves for a corroboration of my position, that they have yet a want of something besides wealth to enable them to co-operate. Call it faith in our fellow-men, call it universalism, or love, or mysticism, call it what you may; science cannot give it, the supply of every intellectual and animal want cannot give it; lectures, books, knowledge, cannot give it.

Now let us turn to the latest abodes of the communal idea. On the other side of the globe, speaking geographically; at the other extreme of the world, theologically viewed, have risen up various associations, wherein mysticism and co-operation have been as closely associated as in the old world.

The Harmonists, Rappists, Shakers, &c., in America, of whom highly favourable accounts, as to physical means, have recently been made public, are quite as mystic as the old Catholic communionists. Which, coupled with the fact that scientific, unmystified co-operation, when tried on the very same spot, with equal means and advantages, in all other respects, failed even under the hands of its great master, is enough to shake belief in the assertions of the dangerous nature of mysteries. If not sufficient to convince the reason, it should at least make us pause before we condemn.

A MYSTIC.

SUBSTANCE OF A LECTURE ON POETIC GENIUS, AS A MORAL POWER.—By J. A. HERAUD.

MR. HERAUD's talent is well known, and needs no praise of ours. Both personal praise and blame are exceedingly repulsive to us at all times; we shrink from each with equal intensity of feeling; but occasionally individuals come in our way, as the personal representatives of principles and opinions, and demand a few strictures, for the sake of universal propositions. For the sake of universals only, however, would we ever pen a line upon an individual character, or put his name in print. Mr. Heraud is a poet and an orator of a very high character; but he is peculiarly partial to *mythos*.* He has stripped himself bare, and with tarlike courage dived into the pool of eternity—out of place and time—a bottomless pit! the bottomless pit of thought: the attempt to explore which reminds us of some beautiful language in his "Judgment of the Flood," where he speaks of

"Imaginations awful, unexplored,
Begot incessant on the evil heart;
Dire brood of mind rebellious, bold to scale
The height of Heaven, and dare the brow of God."

With the exception of "*evil heart*," this language is, in our humble opinion, strictly applicable to every attempt, in or by man, to pass the limits of space and time, and speak a language to man for which God has not given him a capacity, and for which the human heart cannot find a response.

We have neither *space* nor *time*, at present, to enter into a review of the various subjects of the lecture, which was delivered some time ago, in the Milton Institution, Cripplegate, and of which a literary gentleman once spoke to us as follows, in the British Library:—"Do you know Mr. Heraud? What school is he of? I do not understand him." We are not so very dark. But still we think that Mr. H. is soaring above the sphere of general usefulness. Were he to adhere to his favorite proposition, that the language of Nature is the subordinate word of God—we call it the word of God—we would be satisfied; but his Luciferian attempts to escape from the purloins of time and space, puzzle himself, and therefore, much more puzzle his

* A word, by the bye, which is not poetical, though frequently used by Heraud.—"Mythi of mixed creeds and systems new;"—"Mythi following one another," &c.

* Vide—"New Sanctuary of Thought and Science."

hearers. He calls the genius in man a higher order than the language of Nature. This smells of Atheism. It is man's intelligible genius, certainly. It is the human Logos; but it is the mere child of the former, the member of its body. Of these things we shall not speak at present; leaving the lecturer to have it all his own way, we come to the following observations.

In the ode which is appended to the lecture before us, we find the following beautiful lines, to which our heart responds with full consent:—

“ Father Eternal, whom no angel sees
Nor hears, nor archangelic dignities
Know, save in the *Eternal Son*.”

What is the meaning of this?—Why, we ask, should not the creature know the Father but in the Son? We can give an answer, and a very simple answer. The Son of God is *God in Time*, or God brought into creation, and made perceptible to the created mind. All imagery in and by which feeling is conveyed, is, in the poetic sense of the word, God the Son. But the awful and incomprehensible universalities, *infinity* and *eternity*, are God the Father, to whom no man can approach, but in the purlieu of time; that is, in and by images of created things.

“ Defined anon, and growing visible,
A shade, a shape, a symbol it becomes.”

The Father looks with wrath upon every daring attempt to approach him through any other channel. He is a bottomless pit, a hell to every mind who dives into his eternal and infinite bosom, without this accompanying mediator. That mind is lost and bewildered, and finds itself at last, after a vain and fruitless pursuit of a haven of rest, plunged headlong, without rudder or compass, in the Slough of Despond. Any little consolation it derives, it finds by an unconscious retreat, and submission to the Son, whom it proudly and presumptuously attempted to defy. We have nothing to do, but merely open Heraud's own poems at random, to prove this, if required. The Father is inaccessible directly. Time is the sphere of man, both in this world and the next, for the next is also a world of time. Creation is time, and every creature is a *time-piece*, and the Son, the God of time, is eternally begotten, or being begotten, which is succession.

When Mr. Heraud, therefore, in the passage we have quoted, applies the following language to Campbell, the poet:—“ False and injurious predictor of a state when faith shall be lost in sight, and in which hope can have no part, since hope requires time for its condition, and has no place in eternity!”—we say, Mr. Heraud is going beyond his sphere. If he means to say that to God the Father hope does not belong, we have no objection; but if he means to assert, that to the Son, or the Church, hope shall ever cease; that we deny. For the Son is hope, and faith, and love, and time, and succession, and place; and when these cease, creation ceases, and all individual being is annihilated. This is the bottomless pit—this is the Slough of Despond. Faith shall never cease to eternity, and hope shall travel to eternity with time in the heart of every created being. What theologian, we ask, could have taught the poet of hope, that hope was mortal? Who is the bold interpreter of Heaven, that dares to say so? We know that the rhymster, who paraphrased Paul's beautiful description of charity for the Scotch Church, for the sake of his metre has thus expressed himself:—

“ Hope shall to full fruition rise,
And faith be sight above.
These are the means, but this the end:
For saints for ever love.”

But he had no warrant for it in the text, which distinctly says, “ now abideth these three, faith, hope, and charity; but the greatest of these is charity.” The fact is, that the three are one, and cannot be separated. Faith is charity in prospect, resting upon a promise, thus *looking back*. Hope is charity in prospect, but *not looking back*; and Charity is the substance itself, the thing hoped for. Now, in a state of the purest love, there must always be love in anticipation, as we rise in pro-

gression “ from glory to glory.” In the one state of glory, we look forward to the other—that is, hope; and we hope in faith upon the Divine promise. Destroy this trinity, and “ you dare the brow of God,” by rejecting the Son. We defend the Poet of Hope, who makes the everlasting goddess fearlessly and exultingly light her torch at the funeral pile of Nature itself; that is, this present system. God has inspired poets long ago to call Hope immortal, and Mr. Heraud is not able to take her life. We are poor champions for the injured dame, but we shall never see a poignard levelled at her breast, without thrusting out an arm to caution the assailant of his mistake, for it is only a mistake; no evil is meant. But it is bad philosophy, bad theology, and bad poetry.

But have not men often taught that faith would cease with enjoyment? Yes! we have said so ourselves. But if enjoyments never cease, there must be a succession of faiths. Faith in a promise exists till the promise be fulfilled; but we neither can conceive, nor do we believe in any state, beyond which we cannot look, both in faith and hope, to a higher. Therefore, as one faith is realized, another is begotten, for ever. Absolute faith never ceases. No good theologian would ever teach this. It is a vulgar error—a very vulgar error indeed.

We have several more observations to make upon this lecture, but we cannot occupy more space at present. We therefore close, with a sincere expression of our admiration of the talent, the beauty and the eloquence of the composition, as a whole; and were we not certain, that poets are the most intractable of all men, being led more by an afflatus, which they deem infallible, but which blows upon them merely as wind on an Æolian harp, we should advise Mr. Heraud, if he aims at being useful, generally useful as a poet, to worship God the Mediator, and “ dare the Father's brow” no more. We would advise him to paint shades, shapes, and symbols, imagery divine, and pour out his inspiration in forms, and expressions, and graces, which are the appointed vehicles of the Father's invisible and omnipresent life. There is no greater apostate than him who overreaches Nature, the spouse of God. But we must do Mr. Heraud the justice to say, that he has not neglected this imagery. His “ Judgment of the Flood” is full of rich delineations of the works of God. It is a work which never will die. But unless he is resolved to fall from henceforth, he will tread the green sward of Sion's mount, and leave the devils to dip into the bottomless pit. Coleridge has passed as a shadow. He will be little read, and seldom quoted. Society has slipped through his fingers. He had intellectual power to take hold of it, but the fellow feeling was wanting. He did not understand the movements of Providence so well as ordinary minds. Soaring too high, or sinking too low, is equally destructive of a man's utility. High and low, in Nature, are synonymous; they are both digressions from the *juste milieu*, in which all action and instruction are carried on. The high-minded theorist, and the low-minded theorist, are brothers in trade—teachers without pupils, masters without servants, and pompous critics, who can find fault with every thing, but do nothing. The common-place minds, in the mean while, are walking the earth, and fixing the character of successive generations. What a pity it is, that so much valuable mind and moral is lost to the world, from a presumptuous pride of scanning the Deity! We could sometimes almost weep over it. But this world is the devil's. This is actually our consolation, and the cheering thought restores our tranquillity, and we rejoice in the hope of the glory of God. Curse the earth, and let it go from us. We care little about it; and who need care? Who will or can live long in it? It is not a home: it is merely a pilgrimage. But while we are in it we should conform to its laws, and these laws are the laws of corporeal and mental being in union. We should do all the good we can in it, in spite of hate, in spite of friendship, in spite of every thing but conscience, and that Divine power that lives in conscience, and points, with uninterrupted hope, to an eternal progression of being in time and space. Let who will dip unescorted into the bottomless abyss, we hail the Son, and humbly approach the Father through the Son alone.

The following is an extract:—

Byron is in nothing more distinguished from Wordsworth than in this. An unwilling believer in a Supreme Power, and reluctantly yielding to the universal genius as recognisable in the divine logos, he is, nevertheless, not the possessor of, but the possessed by, his own individual and private genius. It was his tyrant, he its slave. Never at one with his conscience—never on a level with her—but under her;—to him she seemed to sleep—but she had mighty dreams—has ever—and at some crisis makes herself known to man in whispers more terrible than peals of the sternest thunder. No man can say, and least of all the poet, I will never have anything more to do with conscience! I mean not to say, that Byron was the most criminal of men, or his verses the most sinful of poetic compositions; but I declare that from failing to satisfy the demands of his conscience in his personal character, he was mastered by his conscience, which, as a tyrant, is the genius of his productions. Hence in all things, he was as clay in the hands of the potter; and as a poet represents the passive aspect of the living verb. The best portions of his poetry are due to circumstances. Though he abused Wordsworth, he imitated him; for Shelley had made him read him or hear him read. He was passive to impressions, and then reacted on them. Byron was a man possessed, but not by the Spirit of God—he was a demoniac. He was a conduit pipe, as it were, of inspiration. Woe to him who is possessed by, and possesses not, his genius. There is too much poetry of this quality. The merely intellectual or sensual poet is a madman. Milton speaks of the trencher fury of a rhyming parasite with contempt; yet it is with bacchanalian songs and amorous ditties that the public is most taken, and in which it is most politic, in a worldly view, for a young poet to appear. Why is this? because the public mind, from congeniality of culture, sympathizes more with the defects of genius than its excellences. Let a poet come before you protected in complete armour, perfectly arrayed in finished panoply, and on that very account ye shall give him churlish welcome! Witness the late acceptance that Wordsworth and Shelley have received at your hand. Had Byron's later and better compositions, written under the influences of the poetry of the one, and the conversation of the other, been published first, ye would have rejected them; indeed, in spite of his name, they were unwillingly received.

That the public sympathize with the defects of genius is clear from the character of Byron's imitators. Mannerism in every artist is a defect—the prison limit within which his genius is confined. This the imitators alluded to adopted—for this they loved him: here, in fact, they thought his merit rested. Absurd error! which places the material necessity above the moral liberty. Of all poets, the highest moral poets are the least popular.

One thing is observable in all the poetry of Byron, that in his classical associations he scarcely ventures out of the school-boy tracts, and deals with the objects he meets as a traveller stored with the common-places of education. In all this he transacts as an intellectualist with the past, and as a sensualist with the present; with conceptions and sensations:—but when his poetry rises, as it sometimes may, into the ideal and eternal, you find that he is overruled and driven on by an impulse which he vainly resists, and at best manifests only a passive agency. "When I am very fine," he said to Captain Medwin, "I don't pretend to understand myself." He was simply the medium of an afflatus which, when once uttered, might have been nonsense for aught he knew.

We have now to do with the poets who exercise *activity*. Being, we have said, must act—in the neuter and passive; we have detected its *eternal* operation. But it operates in time also, and is diligent in reference to sensible ultimates. It is here that the third class of poets are active. Pope, and Campbell, and Rogers, are anxious only for the sensuous form—the channel of expression in which their thoughts shall flow. They prefer act in its lowest spheres to being in any. Unconscious of the neuter, and despising the passive, they interpose a set form of speech, and, to do them justice, never dream of publishing themselves for men inspired. If they approach the purlieu of the eternal and the ideal, they are sure to blunder. Hence Campbell, at the conclusion of his poem, lights the

torch of hope at Nature's funeral pyre—an error of which any theologian might have admonished him. False and injurious predicator of a state when faith shall be lost in sight, and in which hope can have no part; since hope requires time for its condition and has no place in eternity! Such poets as these are the votaries of the sensuous present only—what they remember and what they anticipate, belong both to this *present* life—scarcely to the classical past, and little indeed to the theological future. The best of them is rather an essayist on criticism, than an essayist in poetry.

Criticism prefers the form to the substance—inattentive to the creative spirit, it will condemn a poet for an imperfect rhyme or a halting verse.

In conclusion—That genius is, you know and feel—that it does, is manifest in its various creations—in the person of the poet, how it suffers I need not tell! The world blames the poet for his aberrations; wedded to truth, he is abandoned by the world. You love the poet, as I have said, rather for his defects than his excellences; the better he is, the longer you make him wait for your approbation. Has he courage to the end, then indeed he suffers! suffers the evils of fortune—a living martyrdom, poverty, and the prison—or death! If to escape from these, he becomes mischievous:—take to yourselves the reproach. Nevertheless, however immoral may be his apparent life, so much does the poetic character partake of election, that through both good and evil report the poet seems as if always compelled to perfect his appointed work. He may cease to be a poet to himself, but not to others. Sometimes, also, evils are only external agents, to make him do the bidding of his sender. Many are the poets who have been cradled into poetry by wrong. The poet may injure his worldly peace, but not his vocation; for God himself has declared that he shall bear his message to the world. Oh! how all-important is this consideration to every man of genius. But by him who is verily a true poet, a poet both in word and deed, this warning is not wanted. He is constitutionally prevented from the danger against which it is designed to guard. If he suffer, he accepts injury as the world's wages, which all the truth-utterers have received from it, as the appropriate guerdon for their interference with its wrong-doings. Knowing also that virtue is of such rare excellence, that nothing but herself can adequately reward herself; he solicits only the self-contained reward which accompanies obedience to her precepts. He will bear in mind that genius is nothing less than the development of that moral law which is the life of the human being; and that genius then most truly is, when in harmony with truth as true being—truth, not as a thing, but a person, as the truth, the way, and the life. When the poetic is at one with that brightness of the Father's glory, which is the life of men, it will participate that light in which there is no darkness at all. Poetic genius must live in an atmosphere of purity and music—in an element of the love and the beauty of holiness. Poetic fancy, in its excellence, can only exist in minds which are perfectly serene, and loftily abstracted from the influences of sense. It is in this elevated point of view, that Collins, in his before-quoted Ode on the poetical character, considers the subject, and magnificently identifies the creation of the Cestus of fancy, with that of Nature herself.

A CRY FROM THE CHIMNEYS.

THE following extract is taken from a lecture by Samuel Roberts, on the affecting question of Chimney Sweep Slavery, which is called by him an integral part of the total abolition of slavery throughout the world:—

Do not tell me then of your abhorrence of the inhumanity of the AMERICANS in retaining slavery, while you yourselves tolerate something even worse. Their slave markets, it is true, are vile enough. It is true that young children of seven or eight years of age, are *sometimes* there sold and sent away from their parents to be domestic or field slaves, in distant places, but *their* labour, in either case, is not often either oppressive or unwholesome. Now what is the case here? Not that little beings, born slaves, of a different colour, and considered scarcely human, are bought and sold, no, but that lovely young children,

not only of the same flesh and blood, of the same form and colour but of the same nature and kindred, are commonly bought and sold—sold by whom? Incredible as it may seem—sold by their own parents; sold by their own fathers—ay, sold by the women of whom they were born, whose breasts they sucked, and on whom they were wont to smile. Sold to what, and for what? Sold to certain sufferings; to decrepitude, and probably, to early, miserable death.—What a horrible system must that be which thus inflicts inevitable misery on the innocent, feeble, helpless children, and, at the same time, tempts the parents to a crime of which the most ignorant savages never were guilty,—the bartering of their offspring, at the most engaging period of their lives, for a few pounds, to probable misery, ruin, infamy, and death.

By the merciful dispensations of Almighty God, all creatures, even those evidently designed for subsequent labour, require a youth of liberty and ease in proportion to the probable length of their lives, to enable them to attain the requisite growth in stature and strength of body. Human beings require it too for the strengthening of the mind and faculties. Even young plants, if forced to bear premature fruit, become good for nothing. Who but fools ever work young colts? Liberty seems in a peculiar degree the birth-right of youth, and is of itself the highest source of bliss. A child in chains, would be, of all sights, the most horrible, and the cries of such child the most heart-rending, while the rapturous exuberance of liberty in such, is to every benevolent heart the most delightful. The compelling of children to excessive labour was a crime almost unheard of till the adoption of this accursed practice. Unhappily it hath since been followed up by others almost as cruel, and still more extensive.

It may be said that a deal of this is exaggeration. It is nothing of the kind, so far from it, a tithe of the truth has not been told. A friend states to me,—“I remember that about half a century ago, when what is now called Sheffield-moor, was really a moor, at the top end of which we lived. On a cold autumnal evening, some boys came to tell us that a little sweep was lying on the common—this was found to be the case—he had scarcely a rag to cover or keep him warm. We had him washed in warm water and taken care of for the night. In the morning we got Mr. Hawley, who was then the leading surgeon, to examine him—he said there was no chance of his living long, the CHIMNEY SWEEPER'S CANCER having penetrated to the vital parts. The poor child, though taken good care of, died soon after in Ecclesall Workhouse. The master, it appeared, was a tramping sweep, and finding that the poor child could be of no further use to him, abandoned him.” That dreadful, fatal disease seems peculiar to the victims of this inhuman practice—in fact, so much so, as to have given name to it. The same friend, as a member of the committee, at the request of a medical man, visited a poor young climbing boy, who had been taken away from his master by his uncle—he was full of sores on all the prominent parts, and unable to get out of bed. When a little better, he was taken before a magistrate, the master attending; he was stripped, and his sores, though much healed, were still dreadful. The master did not deny this, but in his justification boldly asserted that *such laceration in the first instance was unavoidable*. This plea the magistrate seemed disposed to admit, till the lovely boy, for such he was, finding that to be the case, so moved the court with his cries, that the magistrate gave way, and the indentures were cancelled. Is this then a task for Christians to inflict on helpless, innocent children, who are too young to be *consenting parties*? If you are not yet satisfied of the dreadful effects of this, perhaps worst of slavery, I have a *living* evidence to produce, capable, if I am wrong, of setting me right. * * *

Gentlemen and Ladies,—You see before you! I say, a fellow creature, formed by God, of the human frame and the human countenance divine, a being, who, as far as I can judge, might, but for this accursed trade, have been one of the most graceful, manly, athletic frames now in this assemblage. That frame might have done credit to his name, which is *Sampson*. He might have been more than this, as far as I am able to judge from disposition to have enabled him to have become, not only a respectable, but a highly eminent member of society,

Dwarf as he now appears from the failure and distortion of his lower limbs—his body, arms, and head, are those of dignity, grace and strength. Till he was put to this inhuman, destructive employment, he states that he was tall, straight, and active. You see, Ladies and Gentlemen, what he is now. He is no stranger among you. He was born, nurtured, and crippled for life among you. For thirty years, he has been a wretched object of compassion in your streets. He has been all that time a burden to himself and to the benevolent among you, as well as an object of severe reproach to every one who thoughtlessly or cruelly sanctioned the horrible practice. *Slavery!* what is any other slavery to this? This is no nigger. This child was not a piccaninny sold by a strange slave trader in a foreign market. No! this lovely, unoffending child, was sold when little more than seven years of age, by his own father, for two guineas, in this land of liberty, in this slavery-detesting town, sold too it may be, to one of the most ferocious beings then in existence, for one of the most inhuman and destructive purposes, that ever was assigned as an employment to any human being.

The cruelties exercised upon him during the two first years, are too numerous and revolting, to be described. It was then, when little more than nine years of age, that a journeyman under the influence of passion, by kicking him, dislocated his hip. The poor sufferer was sent to the infirmary, he remained long there, and when skill had done its utmost, you see the state in which it left him. Thus crippled, he was compelled to serve his time out, in the same state of slavery. It was a little before the expiration of his apprenticeship, that he was brought to the committee more dead than alive, naked, filthy, diseased, famished, and starved, till totally unable to work. Often sent supperless to bed, if bed it could be called, which was a soot-sack spread on a little straw in a cold ruinous out-house, till perhaps four o'clock in the winter morning.

Now then, ladies and gentlemen, is this *Slavery*, or is it not? Pray, will any one here have the goodness to point out to me any slavery more horrible than this? I know of none. There is no other species of slavery in the world besides this, attaching solely to children, none else attaching to those of the same country, accused of no crime. I know of none where the victims are sold by their own parents—of none in which the work and the usage is such as that deformity, disease, and probably death must in early youth be the inevitable consequences. These poor little slaves have not only to work for their own owners, but when they have finished *their work* for them, are lent out like any other animals or implements, to work for others. By this means it is, that the poor cripple before you, contrives to obtain a scanty, precarious, painful maintenance. He is unable to purchase and maintain a boy, so he goes about seeking jobs, and when he has obtained a few, he borrows a *brush*, as he might a brush, for which the owner receives half the earnings.

If these poor little slaves did not die off so fast as they do, there would not be employment for a fourth part of them when out of their apprenticeship. During the last thirty years, has this poor crippled victim to this accursed trade, been seen by you in your streets, by some of you in your houses, black as the chimnies he was employed to cleanse—but you never thought that you had converted him into a *Slave*, that you had crippled him, that you had made him a miserable being, a spectacle of compassion for angels and for men, during thirty years, encountering insult, pain, and want, by your unthinking cruelty. What is to become of him? Owe you him nothing? Hath he not claims upon you now that the infirmities of age, in addition to his other sufferings, are creeping upon him? Oh, how easy, how pleasant it is to execrate the inhumanity of others! The inflictors of misery on negroes are spoken of by us with abhorrence, while we are enslaving, crippling, and destroying, the most engaging and innocent of our native fellow subjects. Have we a plea to urge for this practice, that the slave-owners have not? No! we have not one, while they have some that we have not. But, am I not addressing people who believe in God? Am I not addressing an audience of *Christians*, of accountable beings, whose God is LOVE? Is there then, a being here, who can believe the God who is LOVE,

has not discarded from His worshippers *all necessity for doing evil*? The doing of evil is discarded from his government. The man that cannot obtain what he wants but by doing wrong, wants that with which he has no business, and which will never do him any good. He then becomes the servant of the Devil, to do *his* work and to be repaid, according to that which he shall have done.

To the Editor of the Shepherd.

DEAR SHEPHERD.—Feeling that your more mystical readers may not find many poems, which exactly accord with their own being, I have ventured to pen the following. Perhaps the verse may be a little defective here and there, but they will feel the difficulties which a spiritual man has to undergo, when he is encumbered by the cold forms of language.

AN ULTRA-MYSTIC.

NEW YEAR'S SONG OF A SPIRITUALIST.

Come, drink, my boys, drink from a glass of pump-water,
A liquor so sparkling, so mild, and benefic,
Let's swear to uproot with a terrible slaughter,
That sad host of vagabonds, called scientific.

They all send their boys to learn grammar at schools,
And think it's the method to sharpen their gumption,
They venture to speak and to argue by rules,
And try to be understood—Lord, what presumption!

We know understanding's a gift of the devil,
A meteor which aye will deceitfully shine,
Those *with* understanding are monsters of evil,
And those who have none must be surely divine.

And logic's the apple which caus'd Adam's fall,
It shuts out the spirit, and lets in the letter:
Let's argue without any logic at all;
And if without grammar—why, so much the better.

The dull scientifics, when they study nature,
To gaze on the sun, they look up to the skies;
With sensuous organs they test ev'ry creature:
When we study physics, we shut both our eyes.

Some think, with shut eyes, nought but darkness we're gleaning,
And, truly, we often suspect they are right;
The "cold forms of language" so ill give our meaning,
That what some call darkness, is what we call light.

As words are all humbug, and books nothing teach,
Both reading and writing must be a great sin;
We'll out them, and likewise the use of our speech,
Then surely the mystical reign will begin.

The world came from nothing, the people all say,
And we on a crisis a long time have reckon'd,
When we shall blow intellect—senses away,
And welcome the reign of great NOTHING the Second.

A LIST OF OMNIVOROUS ANIMALS.

BEING much occupied this week, I am unable to write one of my usual articles. However, the reading of the "Mystical Student's" paper has caused me to draw up the following short list:—

Æschylus is said to have written his tragedies under the influence of wine.

Sophocles was a sensualist.

Aristotle was attacked to courtezans; his Ethics were written to an illegitimate son.

Shakspeare, Jonson, and other dramatists of the time, were wine-bibbers.

Raphael killed himself by early debaucheries; Pellini was an almost brutal sensualist.

Goethe was a voluptuary in the most extreme degree; his amours were almost innumerable. Nor was this the mere accident, but an essential of his poetical character. His elegies, perhaps the best works he ever wrote, are refined pictures of the most voluptuous scenes, in which he was a principal actor. Such a dislike had he to anything super-sensual, that a conversation on a spiritual subject was to him the greatest infliction. Iphigenia, the least sensual of his works, was written under the influence of Burgundy.

Kant was an inordinate eater and drinker.

If we look over history we shall find that reflective men have often been abstemious, but that artists (in all the arts) have usually been great sensualists. Shelley will be adduced as an instance to the contrary; but his pretended exaltation did nothing but destroy that "graphic truth" which always characterises the work of a sensualist. The most licentious elegy of Goethe's is as much more valuable than the whole works of Shelley, as a naked Venus, by Phidias, is superior to a gilt gingerbread king.

THE TRANSCENDENTALIST.

N.B. The above is merely written historically, not as exhibiting any party feeling. What I have stated I can prove more at large if required.

THE SABBATH CONTROVERSY.

IN 1595, Dr. Bound published his treatise "of the Sabbath," wherein, he maintains the morality of a seventh part of time for the worship of God, that Christians are bound to rest on the Lord's day, as much as the Jews on the Mosaic Sabbath; the commandment of the rest being moral and perpetual; that, therefore, it was not lawful to follow our studies or worldly business on that day, nor to use such recreations and pleasures as were lawful on other days, as shooting, fencing, bowling, &c. This book had a mighty spread amongst the people, and wrought a mighty reformation, so that the Lord's day which used to be professed by interludes, may games, morrice dances, and other sports and recreations began to be kept more precisely, especially in corporations. All the Puritans fell in with this doctrine, and distinguished themselves by spending that part of sacred time, in public family and private acts of devotion. But the governing clergy exclaimed against it as a restraint of Christian liberty, and putting an unequal lustre on the Sunday, and tending to eclipse the authority of the Church in appointing other festivals.

Archbishop Whitgift called in all the copies of Dr. Bound's book by his letters and officers at Synods and visitations, and forbade it to be reprinted, and the Lord Chief Justice Popham did the same; both of them declaring that the Sabbath doctrine agreed neither with the doctrine of our Church, nor with the laws and orders of this kingdom, &c. Notwithstanding all this, the book was read privately more than ever. "The more liberty people were offered (says Mr. Fuller), the less they used, refusing to take the freedom authority tendered them, as being jealous of a design to blow up their civil liberties." The Archbishop was no sooner dead than a second edition was published, 1606, with additions.—Neale's Puritans, vol. 1, c. 8.

The above circumstances are now reversed. Indeed the people are not unlike pigs, you must pull them back occasionally when you want them to go forward.

TO CORRESPONDENTS.

Shelemiah.—Shelemiah's third letter is truly awful, he has dived into the bottomless pit, and we do not care to follow him. God dwelleth in heaven, and the devil in hell, but the earth is given to the children of men. We have no objection to walk on the green grass with any reasonable and innocent person; but exploring caves and subterraneous gulfs, ballooning and parachuting, we leave to the adventurous, who take a pleasure therein. Shelemiah is a prodigal son, we fear. He is feeding on husks which the swine have left, let him go back to his father, and to his own inheritance. He is not happy.

An Old Subscriber.—The fall and rise of the Church is a species of rebound, not a destruction. When a ray of light is falling down, it has not imprinted on the earth the image of the object it represents, but when it is reflected from the mirror, it leaves the image distinctly painted on the surface. The living gospel has not yet come down to earth. It has not imprinted the image. The gospel is only in its scientific state. This is Antichrist, or contention. But when the divine moral communion of interest and feeling is established, the world visible will then be Christian. We are merely intellectual or argumentative Christians, not genuine heart Christians. Heart Christians can only be generated by Christian communion or community. We are living in the first Adam.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 30, Vol. III.]

SATURDAY, JANUARY 20, 1838.

[PRICE 1½d.]

THE CHRIST—HIS TWO NATURES.

Who is the Redeemer of God's elect?

Ans.—The only Redeemer of God's elect is the Lord Jesus Christ, who, being the eternal son of God, became man, and so was, and continueth to be, God and man in two distinct natures and one person, for ever.—*Catechism of the Westminster Assembly.*

"He put his head in his pocket, and let his heart speak."—*Ebenezer Elliott.*

Last week we treated of the Christ as the new moral power of society. But we said not a word about this Catholic doctrine of the two natures in one person.

This question was once the subject of much thundering anathema. The Nestorians maintained the doctrine of a double nature, and a double person, in the Messiah, and deslamed against the custom then prevalent (in the 5th century) of calling the Virgin Mary the mother of God, saying that God could not be born, and that a distinction ought to be made between the son of man and the son of God. The Eutychians, on the contrary, maintained that the two natures were one combined nature, the incarnate God. Neither party understood the other. But each was well excommunicated by different councils, and the Eutychian council of Ephesus ordered Flavianus to be well scourged, and banished into Lydia, where he ended his days. He had taken the lead in a previous council of Constantinople, which condemned the party which afterwards inflicted the barbarous punishment.

It is now very difficult to determine what either party meant. Each declared that the other misrepresented it. But there is evidently a very beautiful and intelligible meaning in the double nature of the Messiah, which we shall try to bring out and illustrate.

We spoke last week of a twofold development of the nature of the Church after the disappearance of the individual called Christ by way of eminence, viz., a spiritual or argumentative development, which is at present going on, and a moral or divine nature, yet to be manifested in a full communion of interest and fellow-feeling with those who assume the Christian name. These are the two natures of Christ. The Church is the great, or universal Christ; and the individual was merely the image of the universal, which was to be revealed after his appearance on earth. The individual himself had a peculiar destiny—a race of contention and humiliation—a death and a resurrection. This is merely a prophetic tablet, engraven on the page of history to forecast the future destiny of the Church, its humiliation, its death, and resurrection also.

We do not mean to enter into any metaphysical inquiry how the divine and human nature exist in one person together. If a man cannot feel it, words can never explain it. But we have no hesitation in saying that the Church is divine, and will be divine in the very same sense as the Son of Mary, and that every man in life has authority to say, "I and my father are one;" to each, however, different degrees and manifestations of power are given, and there is one head over all.

The human nature of Christ is not the Redeemer, but the

thing to be redeemed. It is the old Adam, the man of the earth. This man of the earth is a contentious tree-of-knowledge man, as well as a sensualist. He is also a selfish man. Selfishness is necessary for the development of contention. It is the moving principle of all warfare, whether individual or national. This principle cannot redeem itself. Had mere intellect or knowledge been sufficient for redemption, the idea of a Christ, which has been blown into the human mind by a divine afflatus from the beginning of time, would have been superfluous. The old Adam would have become his own regenerator or deliverer. The tree of knowledge would have been quite sufficient.

But the tree of knowledge is not a blessing, but a curse, unless that knowledge be sanctified by a higher principle. Knowledge in the hands of selfish men is instrumental only in multiplying crime. The modes of inflicting torture on a human being are daily increasing in number. Among savages these modes are very few. But who can enumerate the instruments of cruelty which can be wielded against our unfortunate race in civilized countries? And every new invention or discovery gives another twist to the thumb-screw.

Knowledge is not a uniting principle. Its natural tendency is to make a trial of strength, by an intellectual controversy. When Johnson met Burke, he said he was always obliged to put forth his whole strength. When Coleridge met any body but himself, he had a pride in silencing them by his superior eloquence, and they, after a vain struggle, were obliged to yield. Edward Irving used to say that he never could get in a word with Coleridge; but Edward, on the contrary, showed his own lordship over others; and thus the graduated scale ascends and descends, and the whole intercourse of intellect is demonstrated to be—a struggle. There is no redeeming power in such a spirit; and even if there were, it never could be universal. It is not a feeling which is common to man, woman, and child. It varies with age, knowledge, and experience. Knowledge is fractional. Learned men talk of books, history, and facts, and they illustrate their poetic and moral sentiments by imagery according to their observation, and their acquaintance with life. Even with the most talented, this is very imperfect and local, and the child and the ploughman's boy may give valuable information, even to the most learned philosopher. Intellect, therefore, never can become the source of a social or common feeling, or a spirit of communion. The child takes no interest in it, and the people, *en masse*, cannot take an active share in it; they are merely auditors and spectators; they look at it as a thing out of themselves, which it is in vain for them to attempt to attain.

But suppose you change the nature of the associating principle. Instead of intellectual discussion or knowledge, let us suppose it is sympathy—a moral feeling, which is not easily described, but which can be created in well organised minds by a slight attention to a few externals. How very different are the feelings! They then become common to all. The very children experience them. They run about with conscious freedom, and freely approach the persons of all, both old and young, of both sexes. The smile of satisfaction dwells on every cheek, and the electrifying sensation travels from hear

to heart, mutual condescension and politeness succeed the stateliness and pomp of unyielding rhetoric and dogmatism; the distinctions which formerly subsisted are now entirely removed, and a new criterion of worth is established, which determines the excellence of individual character, not by the dictatorial and martial power of commanding, dictating, and annoying, but by the more amiable and communicating spirit of yielding and pleasing. The party has now arrived at full communion, because the argument has ceased. Whilst two or three logicians were wrangling together, and occupying the attention of the whole company, the women were yawning, the young men were dozing or lounging, and the young ladies were ogling and tittering; the children were leaning on mamma's knee, and giving evident symptoms of an unsympathizing spirit; but no sooner was the wrangling over, and the game, or other socializing process, commenced, than every heart was interested, every eye was awakened—reserve was removed, fear was destroyed, friendship and condescension assumed the sovereignty, and intellect was laid on the shelf, till a new declaration of war by the combatants. This is simple Nature, and the history of the Church is here depicted in a little winter's evening party.

What we mean, therefore, by the *human* Nature of Christ and the Church is, that fragmental spirit of disunion occasioned by feelings which are experienced only by a few, and unintelligible to the many; and what we call divine, is that uniting and socializing feeling, which is as intelligible to the child as to the philosopher, nay, even more strongly developed in youth than in age. This explains the meaning of the everlasting truth, that "unless we become as little children, we cannot enter the kingdom of God." This saying is probably the most peculiar saying of the Son of Mary. In none can we discover more moral and divine beauty. It points with the finger of God to the moral government of Messiah—to the reign of social friendship and communion. No other feeling can produce communion. The intellect of man is only a blessing when it labours to bring this feeling into action. When it works for self, it is a curse to self, and a curse to society.

Whether Christ first taught this or not, is nothing to us. He, and he only, has had power given him to identify it with himself. He stands alone in the world as the God-man, the universal man, the man who says he will draw all men unto him, and make them *one* with him. He is, therefore, the sole authentic representative of this uniting principle, this unity of feeling, which is what we call the divine nature, inasmuch as it makes us all one in Christ, and Christ in God, and destroys individuality and self, not absolutely, but relatively.

This new Divine Nature has not yet come; it is only attempting to enter the world. The old Adam is still in the ascendancy, and unredeemed; the controversy still goes on; the people still sleep in the churches and chapels; the intellect still quarrels over doctrines, and self still fights for possessions, and vainly endeavours to add field to field, and house to house, in defiance of the woe pronounced against it.

The Christ, therefore, is twofold; one portion is to *be* redeemed, and the other to redeem—one is human, the other divine—one is selfish, the other is social—one is intellectual, the other is moral and sympathetic—one to *die*, the other to live. Clothe yourselves with the latter. Begin the communion of feeling, and it will grow like a plant, in favour with God and man. Cast off the dying Christ, and embrace the living.

The selfish spirit resists the communion, and refuses to be clothed with the Divine; and its divines have invented a thousand apologies for it. Some tell you, that redemption is wholly an inward thing, and that it has nothing to do with externals! others will tell you, that it will never take place in this world more than hitherto! Hence they conclude "Every man for himself here, and trust in God for glory hereafter."

With these convictions, many pious ladies and gentlemen, hold prayer-meetings in drawing-rooms, with servants in livery behind the door; and pour out their souls in holy sincerity and sentiment to God. The clergyman prays, the ladies groan and sigh, the servants listen at the key-hole and laugh, the groom kisses the cook in the kitchen, the night-ranger prowls in the poultry-yard for a Godsend, and Providence fails not to supply his wants at the expense of false and thievish Christians who

have stolen a name that does not belong to them. Which is the real thief?

Nothing is more evident than this, that Christianity foretells its own political realization. The law of Moses also foretells the same of itself. These two are merely one substance with two polar aspects. The law is the external circumstances. The Gospel is the internal being which reciprocally moves and is moved by these circumstances. The law must be consummated. The law is for this world. It is a purely temporal system; a ceremonial system. It precedes the Gospel, as being the lowest department. Hence the salvation of the world is represented under the figure of the Jews returning—that is, the law-people gathering. But the Jews are not the real law-people. "Ye are *not* my people, and I will *not* be your God—I will no more have mercy on the house of Israel, but will utterly take them away." The old law and gospel are historical pictures of universal facts. The law-people are the materialist, or political, or infidel species of mankind, the law-mongers, the external circumstance men. These are the universal Jews. Their philosophy is limited to this world; Moses never spoke of another. Their hopes and their fears are all concentrated in this little area of matter; but they cannot accomplish their object without a more refined species of deliverer—a God-man, a mediator, to connect heaven and earth, to associate the human with the Divine, and the expectations of time with the hopes of eternity.

The establishment of the ceremonial law is essential to the restitution of all things. By ceremonial law, we mean outward arrangements, corresponding to the progress and wants of man. We make not the slightest allusion to the old Jewish law, which was a mere local institution for an infantine state of society. We mean a ceremonial law created by the social feeling, in other words, a social system. This social system, however, is but a poor drivelling earthly thing, without that marvellous charm of the Divine nature personified by the Son of God. The material mind will laugh at this, we know, (we are prepared for scorn) but it must shrink before its sublimity and its power. We are quite secure; we could sit down with our hands in our pockets, and witness the defeat of the law-mongers who reject this principle. But at the same time we frankly own, that without the law-people we can do nothing. The Gospel is as frail without the law, as the law is without the Gospel. They are merely the spirit and body; their union ought to be courted, not avoided.

Here again, we have the Christ and his two natures, under another form, but essentially the same as the former. Law is the sphere of intellect; the gospel of feeling and communion. These two divisions will meet you in every view of the subject. We are not looking at the individual Christ, but at the universal nature of man as a social being, and a being possessing a mind which bears the image of the infinite and the eternal in its powers of imagination and abstraction. How Christ was united to God and in what sense he was a Son, is beyond our sphere, beyond our discovery, further than our own experience goes. We can imagine nothing generically distinct from our own nature; we may conceive a greater power, but the species is the same. We may imagine a voice speaking within him, but that makes him merely a prophet, which is an inferior order of apostleship. But we can imagine our own nature exalted to any possible height of perfection, merely by the social feeling, and clothed with dignity and sublimity, by the superaddition of the principle of Sonship, which aspires to an eternal progression of being beyond this sensuous sphere. These two feelings, the social feeling for time, and the Divine Sonship for eternity, constitute the double nature of the *perfect* Church, and make up our beau ideal of Christ's reign on earth; the union of the law and the Gospel, the amalgamation of the Jew and the Gentile, the final fulfilment of the promise to the Fathers here, with the rational and well-grounded hope of its more perfect realization hereafter.

CONVERSION OF A CHURCH-OF-ENGLAND CLERGYMAN TO THE BAPTIST PERSUASION.

We have before us the *twelfth* edition of "A letter to the Provost of Worcester College, Oxford, by J. C. Philpot, late Fellow of Worcester College, and Curate of Stadhampton, Oxfordshire, on resigning his fellowship, and seceding from the Church of England, in which the errors and corruptions of the Established Church, the principle and practice of the Universities, as well as the congregations and preaching of the orthodox and evangelical clergy are freely commented on."

From this portentous preface one would naturally expect a full exposé of the Anti-Christian spirit of the Church of England, and something like a model of a Christian church. But the reader will be sadly disappointed. The poor man has merely fulfilled the old proverb, "out of the frying-pan into the fire." He disapproves of established churches, and infant baptism, and sprinkling the face with water. He prefers immersion! Poor soul! We hope the Baptists have slopped him well before now! The most innocent prayer that we can offer up for him, is that he may have a good ducking. Here are his own words—

"I here then express my decided conviction that the very principle of an establishment is contrary to the New Testament, and in opposition to the revealed will of God. The Scriptures of truth represent the whole world as lying in wickedness, apostate from God, and exposed to his righteous indignation. Out of this fallen and apostate world they declare that God has from all eternity chosen a people whom he has formed for himself, that they might show forth his praise. This elect people the same Scriptures describe as scattered up and down the world during their *unregenerate* state, 'foolish, disobedient, deceived, serving divers lusts and pleasures,' until at the time appointed of God they are effectually called by his grace, and manifested as the chosen remnant. Being then baptized by immersion (the only Scriptural mode), they are formed into churches as visible societies, separate from the ungodly and unregenerate world. If men's eyes were not blinded by pride, prejudice, education, and the deceptions of the devil, he that runs might read this simple sketch of revealed truth, written as with a ray of light in the pages of the New Testament. But if this be true, what warrant is there for a National Establishment which includes as Christians all that are born within certain limits called a parish, and sprinkled at the font in infancy? Where in the word of God, is there any foundation for parish livings and parish churches, supported by tithes wrung from the farmer, and by rates levied upon the householder? Can persons carnal and *unregenerate*, enemies to God, children of the devil, as the Scriptures call them, be made by any human contrivance, or carnal process, members of the Church of Christ?"

By what process was Mr. Philpots made a member of the Church of Christ? and who told him that he is a member? and who told him that the Baptist chapels are Christ's churches, and that by being dipped over head and ears in water, he has been admitted into the sanctuary? Is not all this a human process? But what is the use of all this, if they have not the spirit of Christ? and if they have the spirit of Christ they will do his works, and they will be one family, and Christ will be the father of it. Is it so? We should like to see the Baptist that has the hardihood to pollute his lips with an affirmative answer. There is not a parish church in England, nor a Mahometan mosque in Turkey, whose congregation is not as near to Christ in spirit as the Baptist mockery of an elect people. The new and regenerate spirit of this immersed "proselyte of the gate" may be estimated from the following sentence, written of the church he has deserted:—"She affects to save souls, and deludes them into the bottomless pit." Considering the gentleman's notions of the pit that is bottomless, this is pretty strong. He may congratulate himself that his dip has saved him.

We believe Mr. Philpots very sincere, we can easily sympathize with his feelings, and he has given good evidence of sincerity in resigning a fellowship, and a church living. Many, indeed, resign a fellowship in order to take a wife; but the church-living can be held in common with wife and children.

These things to an honest man, are mere stubble, but in searching for motives we must always consider them. He will lose nothing by the change, but we cannot say, that he is one hairs-breadth nearer the kingdom of God than before. He has not told us what this regenerate nature is, what are its fruits, how he knows that it is not a delusion, and how he accounts for the worldly-mindedness, and selfishness, and money-griping propensities, of his regenerate brethren. Why do they not make one family? Why have they not one purse, one home, one interest, one heart? We have known many of the immersed, but we never could perceive that the dip was of much service to them.

The following extract is worth reading.

"Lastly, I secede from the Church of England, because I can find in her scarce one mark of a true Church. She tramples upon one ordinance of Christ by sprinkling infants, and calling it regeneration (the word of God allowing no other than the baptism of believers, and that by immersion), and profanes the other by permitting the ungodly to participate. The true Church is despised, but she is honoured. The true Church is persecuted, but she is a persecutor.* The true Church is chosen out of the world, but she is a part and parcel of it. The true Church consists only of the regenerate, but she embraces in her universal arms, all the drunkards, liars, thieves, and immoral characters of the land. She christens them, she confirms them, she marries them, she buries them. And she pronounces of all for whom she executes these offices, that they are *regenerate*, that 'all their sins are forgiven them,' that they are 'the servants of God.' If perchance on a dying bed, any doubts and convictions should arise, that all is not right for eternity, she sends her minister to visit them, and 'to absolve them from all their sins.' And having thus lulled their fears and deluded them to die in peace, she quiets the rising doubts of their friends at the mouth of the grave, by assuring them, that 'this our brother is delivered out of the miseries of this sinful world,' and is 'committed to the dust in sure and certain hope of the resurrection to eternal life.' Oh! could the awful veil that hides eternity be for a moment lifted up, we should see that thousands whom the Church of England is blessing—*God is cursing* and that tens of thousands whom she is asserting to be 'in joy and felicity,' are at that moment 'lifting up their eyes in hell being in torment!'"

No doubt, the Baptists never commit a mistake, in dipping the unregenerate—who make their final dip into the lake that burneth with the victims of the Church of England delusion, and popish idolatry, "dead Calvinists," as our author calls them, and other water-sprinkling heretics, who have not been sanctified with the "blood of sprinkling."

The true baptism, is the immersion, full immersion, of the selfish nature in the spirit of communion. The Baptist doctrine is a poetical figure of it. The sprinkling of the Church is a good poetical figure of the spirit of Christian communion that belongs to the Church. It has only got a little sprinkling of it. Full communion is the true baptism; we are Baptists, immersion Baptists; but we consider children as fit as men or women for the holy rite. It requires little knowledge to feel the love of God and man, when that love is cherished by the ceremonial law of God, which law is the arrangement of society according to a model of universal justice. The law of Christ is love, but it can only live in the ceremonial law. Christ came to the law, and he is crucified until it be restored.

* The Established Clergy are using this very language in their own behalf. There is no Church persecuted but one, and that is "love." The rest are only rewarded according to their works.

CLERICAL FOOLERY.

"A correspondence has grown up between Mr. Townsend and the 'Tracts for the times' people of Oxford. Where are our pretences when this nonsense is going on in the heart of the great Protestant university? The questions in debate now are, whether men shall turn their heads to the east, or to any other

quarter of the compass, during the reading of the creeds? Whether the clergy shall wear little crosses on the tips of their scarves? Whether they shall put the bread and wine on the table in the chancel with their own hands, or by the hands of the churchwarden? Whether they shall put them primarily on a little table apart, or in a recess in the wall? Or whether they shall make a bow to them as they advance to the table, or omit that piece of politeness? Mr. Townsend, it seems, has said, cursorily, that all those tricks savoured of Popery. Dr. Pusey, for it is no less than the Hebrew Professor and Canon of Christ's Church who feels aggrieved, proceeds formally to vindicate the orthodoxy of those prodigiously childish persons who think that they are thus actually restoring the purity of the Church. Hume, in his history, observes with keen and due contempt, "that the most furious quarrels of the sectaries were about surplices, rails to the communion table, the position of the reading desks, and such other trivialities." And are we to have all this nonsense renewed, and solemn men in doctors' hoods thinking that they are not committing the most arrant foolery by scribbling either for or against them? And all this trifling when the very existence of the Church is at hazard—when a rabble of legislators in the streets are howling for her plunder, and Popery, like a wild beast, is foaming at her threshold. Let Oxford bestir herself while she remains a University, leave those pompous triflers to their obscure squabbles, and add something manly, honest, and rational, to the national defence of Christianity."—*Blackwood's Magazine*.

This controversy will be more effectual in bringing the Church to its grave than all the howlings of the "legislative rabble." The tract gentlemen are storming her on the south; the Radicals on the north, where Satan, (see Milton,) raised his standard.

Of the above party, the Oxford Tract party, of which Mr. Newman, Rector of St. Mary's, Oxford, and Dr. Pusey, Professor of Hebrew, are the chieftains, the *Record*, a religious paper, speaks as follows:—

"Now that there are two societies formed, let every man go to his own company. We (in common, of course, with every Christian man) not only consider it our duty to assist in bearing the knowledge of the gospel to those who are lying in ignorance of it; but to be very careful in making the attempt to see that it is the *very gospel of the grace of God* that we present to our fellow countrymen, and not a *spurious and destructive imitation of it*. Every man is undoubtedly called upon at all times, and especially in times when the essential principles of Popery are attempted to be introduced into the Church, by men of name and consideration in her communion, to exercise a godly jealousy in this matter, and seriously to consider, as in the presence of his judge, what is due to the cause of truth and of God. Deeds, in most cases, speak more loudly and significantly than words. The Reverend Professor Pusey, we perceive, has instantly joined himself to this society. Here is his declaration, as to the quarter in which he expects countenance, support, and circulation to his ruinous delusions."

So say the majority of the Churchmen of the new party! And John Wesley, whose followers now go hand and glove with the majority, and are almost on the eve of a coalition, says of these very zealous diffusers of the *very gospel* of the grace of God:—

"To speak the naked truth, not with anger or contempt, as too many have done, I acknowledge that many, if not most of those that were appointed to minister in holy things, with whom it has been my lot to converse, in almost every part of England or Ireland, for forty or fifty years last past, have not been eminent either for knowledge or piety. It has been loudly affirmed, that most of the persons now in connexion with me, who believe it their duty to call sinners to repentance, having been taken immediately from low trades, tailors, shoemakers, and the like, are a set of poor, stupid, illiterate men, that scarce know their right hand from their left; yet I cannot but say, that I would sooner cut off my right hand than suffer one of them to speak a word in any of our chapels, if I had not reasonable proof that he had more knowledge in the Holy Scriptures, more knowledge of himself, more knowledge of God and

the things of God, than nine in ten of the clergymen I have conversed with, either at the universities or elsewhere.

"Insolent clergymen, pleasure-taking clergymen, praising clergymen, preferment-seeking clergymen; these are the wretches that cause the order in general to be contemned. These are the pests of the Christian world—the grand nuisance of mankind—a stink in the nostrils of God.

"I see those running whom God has not sent, *destroying* their own souls and those that hear them, perverting the right ways of the Lord, and blaspheming the truth as it is in Jesus. I see the blind leading the blind, and both falling into the ditch. Unless I warn, in all ways I can, these perishing souls of their danger, am I clear of the blood of these men? *Soul-damning clergymen* lay me under more difficulties than soul-saving laymen."

We leave Mr. Wesley himself in the hands of Mr. Philpot, the new Baptist convert. No man can draw his own picture. We doubt not that John, and all his followers, will find their portraits rather hideous to look upon, with nothing but lurid red for the lights, and lamp black for the dark shadows of their stygian countenances. Let the clergy only draw each other's portraits, leave them to abuse one another, and by clerical testimony alone you may prove, with innumerable respectable witnesses, that they are all children of perdition, and soul-destroying traitors. If the real gospel of the Son of God were in the world, would its professors talk thus? We make no distinction between them; they are all followers of the Beast, and so are we; but we are striving to destroy the monster, they to preserve his life. We are only Christians intellectually? Heart Christianity is not in the world.

* Quoted from the *Patriot*, of October, 1836. See a pamphlet, called "What, and who says it," by John Search Ward and Co., Paternoster-row.

REPLY TO THE ARTICLE "MYSTICISM AND CO-OPERATION," OF LAST WEEK.

If we cannot convince our correspondent of his error, we will convince the majority of our readers. There is a considerable portion of truth in what he says. But we read history somewhat differently. The co-operative mystics of whom he speaks were all formalists. Plato's republic is a form, and he positively maintains what Owen teaches, that by the society form the individual character is fashioned. Pythagoras was a disciplinarian full of forms, and community of goods was the principal. The monks were all formalists, and the very beginning of an order was the drawing up of a list of rules and regulations for the approbation of his holiness. These rules being formed, the characters came into them. Had the Pope waited till he found monks, before he founded monasteries, we should never have heard of monastic orders. He prepared a habitation for them, and they flocked to the habitation like doves to their windows. It was the same with Ann Lees, and the Messrs. Rapp. They began with the forms as soon as they could collect a sufficient party to begin with.

As for our correspondent, he does not belong to the school of Plato, nor Jesus Christ, nor even Pythagoras. He belongs to that modern school, established by an author who wrote under the assumed name of Dionysius the Areopagite, which took the name of modern Platonism, and caricatured the intelligible philosophy of Plato by disbanding the intellect, and pretending to cultivate the feelings without it. It never produced a community that we know of. The purest mystic community that history speaks of is that of the Trappists, who never speak, who dig their own graves, and fill them up again in daily succession, till at last they drop into them, and their brethren cover them in dumb solemnity. But these are genuine Catholics of the Roman order. All the mystic orders we ever heard of repudiate the foolish notion of our correspondent, that "to prepare a form first, and to seek the animating spirit afterwards in such form, is no less absurd than to look into empty egg

shells for the chick germ;" but why should the chick germ exist before the chicken? and why should a hen lay an egg first, and hatch a chicken afterwards? Because, as an Apostle beautifully lays down the universal truth, "The first man is of the earth, earthy—the second man is the Lord from heaven;" and, as Moses himself most philosophically teaches, God formed man of the dust of the earth first, and then breathed into his nostrils the breath of life. The material foundation being the lowest, is first laid. The cellars are built first, and the garret afterwards. Our correspondent would begin to build his house at the chimney tops! What a strange architect he is! a most aerial castle builder! No wonder there are so few of the species. We really wonder there are so many.

But his doctrine is worse than absurd, and irrational, and false—it is really selfish. It teaches a sort of individual satisfaction—it tries to make the individual happy amid the surrounding misery of society. It kills the social feeling by endeavouring to form the individual character in solitude, a thing which is so contrary to nature, that a friend of ours a few days ago characterized it by a name which we would not commit to paper.

We repeat the important truth, that the process of Nature in every species of creation is to begin at the lowest, and ascend to the highest, and that the material form of society being the very lowest object of society, is on that very account the first point to be settled.

But it has always been our doctrine, and it still is more positively than ever—that as God, who formed man, had a view to the spirit he meant to put in him, so those who form the social system, originally should have a view to that class of spirits they mean to collect. New Harmony has not succeeded for want of a religious feeling. The spirit is too sensuous. This we grant; but with a few genuine feeling minds to begin with, there can be no doubt but a system of community might spread with greater rapidity than ever monachism did. We should be very glad if our correspondent perceived the force of these truths, but whether or not, we have no shadow of a doubt that he is under a gross delusion, and has committed a sad blunder in reasoning.

We were requested to send the article of our correspondent to the *New Moral World* if we rejected it. We prefer inserting it. The letter is intelligible enough, and it is an attempt to wrest from us our favourite argument, that the religious feeling is necessary for social combination. We commenced the third volume of the *Shepherd* with this idea. Our friend clandestinely endeavours to pervert the truths of history to his own favourite hypothesis. There is no difficulty in refuting him, and we would rather refute him in our own columns than in the columns of another paper. The subject is most important. It is not new to us; but the view which "A Mystic" has taken of it is a piece of presumption we were not prepared for. Did he ever read Plato's "Republic"? Did he ever read the history of the foundation of the order of the Jesuits? The idea arose in the mind of Ignatius Loyola, and a few friends. He formed the outward model of this community; after repeated disappointments, he obtained the Pontiff's consent. His numbers increased slowly at first, but before a century had expired they were directing the counsels of princes, and occupying the most important educational chairs in Catholic countries; and, moreover, they were a progressive body, always changing and improving the rules as they themselves improved under their peculiar discipline. If a Mystic had half the spirit of a Jesuit, he would begin his community with six men. Mahomet began with four. Mystics are too fond of ease. They prefer writing, and talking, and criticizing.

We know it will be replied to this that the Mystics want to do nothing. They are drones themselves, and would have all the hive to be drones also; but they will be expelled and banished into the bottomless abyss of thought, their own appropriate sphere. Mysticism is Individualism, of which we mean to treat next week. It is a most important department of Universalism, but grossly caricatured by those who go by the name of Mystics.

CHURCH EXTENSION AT GREENOCK.

(FROM A CORRESPONDENT.)

ABOUT eighteen months ago, the friends of "our Zion" in this place, having caught the Church-extension fever, discovered all of a sudden that they had amongst them an "unexcavated mass of heathenism;" and, not to be behind their neighbours in manifesting their zeal in the great work of *excavation*, engaged a licentiate of the Church of Scotland, who, with the assistance of a few zealots in the cause, personally examined some of the most destitute parts of the town, in order to learn the real state of the *heathen*. A public meeting was thereafter called and their report read. It set forth, as was to be expected, that an alarming "mass of heathenism" existed, and, by way of representing a specimen to the astonished friends of the Kirk (although no instance of *Bible-burning* was recorded), a story was told of an aged woman whom they discovered, who acknowledged that she had never heard of the name of Christ! During the recital of this heart-stirring tale, the countenances of the credulous might have been observed assuming an inordinate length, which strangely contrasted with the smiles of the unbelieving Voluntarys, many of whom were present. From the nature of the resolutions moved, and the addresses delivered, it appeared as if the heathen they were all the while contemplating were the Voluntarys, for the greatest part of their fire was directed towards them.

Having obtained a preacher, the only desideratum, to complete the Chalmersian antidote to Voluntaryism, was a place to preach in. Their finances being rather slender to undertake the erection of a church, the Methodist chapel, being then vacant, was taken for one year as an experiment. It was accordingly opened in due form, and with the brightest prospects of success. The most strenuous efforts were made to secure attendance—seats could be obtained for anything or for nothing—so that every facility was given for the "excavation of the heathen." The whole excavating-machine being thus set in motion, the leading Compulsories might be seen congratulating each other on the progress of their scheme, and looking big with expectation—nay, they imagined they already saw the total overthrow of the "Voluntary system." Some of the more zealous suggested that the locality of the chapel would make a "nice *see* parlour," if they could but get "a bit endomorphic" for the minister. From the efforts made, it was expected that on the first Sabbath the chapel would be crowded by those for whom it was intended; but, if we may judge from the exterior appearance of the majority of those who did attend on that occasion, they were heathen of the better sort. The fact is, fearing a failure, a good many of the Church friends attended for the purpose of filling up the seats, and making something like a respectable appearance. This, however, could not continue, and the consequence was, that on the following Sabbath, the preacher found his congregation considerably diminished. This was disheartening enough, but the worst is to come yet. Sabbath after Sabbath a sensible decrease went on, until the number was reduced to about twenty!—a very neat and manageable congregation.

In these cheering circumstances the place was kept open for about nine months, when Mr. Tait, having *excavated* the Greenock heathens in so short a time, determined on removing to "a more extensive field of usefulness," Botany Bay! and accordingly sailed thence shortly after. Since then, we have heard very little about church extension in Greenock. The friends of mother Kirk would do well to take warning from the above facts, especially those who are "waiting for the moving of the waters," to step into a *living*, lest they share the fate of Mr. Tait—"Botany Bay for life."—*Glasgow Argus*.

* This is one of Dr. Chalmers' expressions.

CLERICAL INTOLERANCE.

(From the *Cheltenham Free Press*.)

ABOUT a week ago, a poor woman who had just lost an infant about sixteen months old, applied to a reverend curate, in the

borough of Stroud, to ask him to officiate at his interment. "Where was your child baptized?" was the interrogation of the priest. At such a chapel, answered the poor woman. "Then let the people at the chapel bury it," was his haughty reply. He knew there was no burying-yard at the chapel, and therefore the dust of the child was to remain unburied. Whether his after cogitations may have suggested that an *infant sixteen months* old was not the fittest object for intolerance to pour out the vial of wrath upon, we cannot say, but the parent was sent for, and the following very sane and learned interrogations delivered in writing. "With what *matter* was the child baptized?" "With *what words* was the child baptized?" When we saw these queries in writing we could hardly believe our eyes. For an apostolical priest to be so ignorant of ecclesiastical doings in the country in the various denominations was at least no credit to his reverence. He knows, or as a parochial priest he ought to have known, that all denominations use *water* in baptism. Or if they use any thing else he ought long before this to have ascertained it, that he might warn his parishioners against such wickedness. "With what *matter* was the child baptized?" was then a paltry inquiry, unworthy of a successor of the Apostles. The other question was no better. He should have known, that all Dissenters, whatever interpretation they may put upon the words, use the form prescribed by our Lord. He knows also, that in such a case, mental reservation is a matter of no consequence in the Church. A late work from the press on "Church Unity," by a clergyman, tells us that "*drunkard, swearer, &c., is a priest, and that God's ordinance cannot be made better by man's goodness, nor worse by man's sin.*" But what if wrong *matter* had been used and wrong words uttered, would he have deprived the child of a grave on these accounts? The poor child could not help it, and to scourge the dead for the living, would be such a superfluity of vengeance, that even bigotry blushes at the thought of having such a dirty task to perform. The wife of the patriarch Abraham had not been baptized or initiated into the religion of the children of Heth, and yet these depraved Canaanites said to the father of the faithful, "In the choice of our sepulchre bury thy dead; none of us shall withhold from thee his sepulchre." Even Paganism suggested that it would be indecent and cruel to refuse the dead a grave. We should like to know what text of Scripture there is that directs a kind and forgiving follower of the Saviour to refuse a grave to an unconscious infant. And if the text is not to be found in the New Testament, but is a canon of the Church, then the Church has been guilty of adding to the Scriptures, and therefore exposes herself to the curse mentioned in the last chapter of the Revelation of St. John. But we shall be told that the clergy of the Church are the only persons that have a *commission* to baptize. Were this true, still there is no text that connects the baptism and burial of an infant together. But a little examination of the much-vaunted commission would show the arrogance of such a claim. A commission supposes commissioners, and *laws* to regulate their commission. We cannot suppose that Christ gave a commission, but neglected to give any laws to guide the commissioners. In Timothy, Titus, &c., we have the laws of God given for the express purpose of guiding the apostolical commissioners. Now, it is only for any man to read those laws, and to inquire into the conduct of the episcopal commissioners of our day, to find that the apostolical regulations for choosing and commissioning a minister of the Gospel, are daily set at defiance by the episcopal commissioners. We will not say that the Dissenters are scriptural in all they do, but we just ask any man, to place in three columns, 1. The apostolic commissioners and their laws, as contained in the New Testament. 2. The episcopal commissioners and the conduct they pursue in commissioning priests at the present time. And 3. The dissenting commissioners, and the laws they observe in choosing their ministers. Let him put the subject in a fair light, and he will see that the dissenting commissioners dissent not from the apostles, but from the episcopal commissioners, and that it is because they "obey God rather than man,"—because they follow the apostles rather than the episcopals who set the apostles at naught, that the churchmen of our time say, "that they have no right to baptize." That is, the men who

trample upon the laws of revelation, in commissioning ministers who are neither "apt to teach," nor anything else that revelation enjoins, are the only persons fit to baptize and teach! And the persons who are selected in accordance with the laws of God, are not fit for the sacred office; and therefore, as the climax of absurdity and wickedness, those whom the latter baptize are to be refused a grave!

A LOOKER ON.

THE TRANSCENDENTALIST'S NEW YEAR'S ADDRESS TO HIS PECULIAR READERS.

MOST PATIENT OF HUMAN BEINGS!—Before I began to write this letter, I formed a bold hypothesis, namely, *that you exist*. Well am I aware that I have readers, but whether I have had peculiar readers I do not know; readers, who have followed my own meaning, without lumping me with this or that sect, and have perused my papers not merely because they fancied they perceived in them some favourite tendency of their own.

Well, then, dear readers, (assuming your existence)—we have now known each other above a twelvemonth, and you must have perceived that I have had nothing to do with the views of any other correspondent, but have quietly pursued a path of my own. Many, I dare say, followed me through my Dialogues with the Materialist, but took fright at those I held with the Idealist, which a very good friend of mine hinted, had a polytheistical tendency. Many, I dare say, thought I was going the whole hog towards mysticism, and were marvellously edified when they saw me turn my horses' heads in another direction.

My dear invisible Church (truly invisible, even to its pastor, as I never set eyes on one of you)—my dear Church, I'll let you into a secret—I am no mystic; I never in my life was in a "high sphere," and never experienced an "inbirth." I am no ascetic, but have a remarkable partiality for steaks and oyster-sauce, "*cos 'em so delightful*," as Buckstone says. I like thoroughly to enjoy myself, and counsel all of you to do the same; therefore I have not the slightest objection to your reading my pastoral letters over a glass of whiskey and water, and afterwards using them to light a pipe of tobacco.

Of all things, abstraction is the most detestable, unless when used for concrete purposes. To understand a whole, it is necessary to consider its parts or its qualities separately, but this is merely for the sake of again uniting our knowledge. Mathematics, for instance, teach one property of body, that is, its different relations when considered under the category of quantity. But what a jackass would the mathematician be, who fancied his abstractions gave a perfect knowledge of corporeal substances, and despised the chemist who gave him properties discovered from another point of view. Attraction is a sort of division of labour; the concrete may be seen in so many lights, that it is found necessary to consider each of these lights as a peculiar science. Suppose there is a particular square table, and myself looking at it. This is a concretion, which will furnish matter for various abstractions; the square form of the table will give a subject to the mathematician, the grain of the wood will busy the student in vegetation, the brown colour will employ the optician, the structure of eye, whereby I am enabled to see the table, is matter for the anatomist; the mental form in which I am obliged to think of the object before me, will occupy the logician: and lastly, the consideration of what I may be considered apart from these forms of thought, will interest a certain class of metaphysicians. None of these worthies must, however, give themselves airs, and think that the whole sphere of knowledge is comprised in any one of their peculiar sciences. They are but members of one whole, and their only use is to aid in bringing forth one whole result, just as in a pin manufactory, the maker of the heads, the cutter of the wires, the sharpener of the points, and others, do not work that each may keep the result of his own labour in a separate box, but that all the results may be united to one concrete—pin. When I call abstraction detestable, I mean only so far as it keeps itself in a state of proud exclusion, when the mere abstracter considers his own as the chief science, and all the others as mere bubbles.

Some attach a world of importance to the sentence "I am," and think it is an expression of the absolute. But what is this, "I?" A mere abstraction; a lot of things unperceived, and we begin to consider the perceiver apart from the things, and ask what he is in his own being. What right have we to suppose that he has an "own being," when it is only for the convenience of thinking, that we set him apart from these objects. In another sense, the "I" may be used as an ultra-concrete, meaning the perceiver and all his objects taken together in a lump, and of this "I," alone have we a right to predicate existence.

Abstraction in a scientific point of view, is the separating one quality from others, which are necessary to its existence for the purpose of consideration, and is all by will, when the abstracter is not tempted to suppose that this quality can actually exist in this separate state. Asceticism is moral abstraction; an endeavour to live independently of external things; an attempt to escape from a struggle when life itself is nothing more; in a word, an approximation to non-entity.

Avoid Nihilism; to which every attempt to run to the extremity of either of two opposites, instead of luxuriating in their confluence, will invariably tend. A strong, though regulated sensualism is requisite to enjoy life; life is the flowing on from one object to another. Endeavour, as it were, to imbibe so many objects, to drink them in, that each moment may be crushed into a wine-cup of sweets. "*Panta reei*," said Heraclitus (all things flow)—a still being is no being.—We've got a new year, dart merrily through it.

THE TRANSCENDENTALIST.

P.S. Will talk about Faith next week.

TO THE EDITOR OF THE SHEPHERD.

DEAR SHEPHERD.—Feeling myself gratified by your insertion of my first attempt, I have composed a sonnet of no less spiritual tendency:

THE ULTRA-MYSTIC,

SONNET TO NOTHING.

Nothing, how great art thou, stupendous thought!
Who reignest no where, sittest on no throne!
Unseen, unheard, unthought by any one,
Whose solemn dictates in no school is taught!
To thy non-entia region are we brought,
By old abstraction, dull, ascetic, croon,
Who aye to leave this sensual earth is prone,
Which with bright Nature's hues and warmth is fraught!
Nothing, to thee, what gorgeous names are given!
We call thee light, and love, and pow'r, and heav'n,
When of thy might to novices we preach.
Thy patient votaries, great cipher, hear!
Keep us from marriage, rump-steaks, gin, and beer,
And henceforth all our works shall nothing teach.

TRINITARIANISM AND SPIRITUALISM OF VOLTAIRE.

FOR the satisfaction of modern wisacres, who prate about matter, and rejoice to call themselves by the dullest and stupidest principle of Nature, we quote the following passage from a letter of Voltaire to a correspondent, in his "*Elements of the Philosophy of Newton*."

"You say it is to be regretted that he (Newton) did not more clearly explain himself concerning the reason which often occasions the attractive force to become repulsive, and concerning the force by which the rays of light are darted forth with such a prodigious velocity; to which I may venture to add, that it is to be regretted that he could not know the cause of these phenomena. Newton, the first of men, was nevertheless but a man, and the first springs which Nature employs are not within our reach, when they cannot be subjected to calculation. It is easy to compute the force of the muscles, but all the mathematics are insufficient to inform us why they act at

the command of the will. All the knowledge we have of the planets can never inform us why they turn from west to east, rather than in the contrary direction. Newton, though he anatomized the light, has not discovered its intimate nature. He knew well that the elementary fire is endued with properties, which the other elements have not.

"It passes through a hundred and thirty millions of leagues in a quarter of an hour. It does not appear to tend towards a centre, like body, but expands itself equally in every direction, contrary to the other elements. Its attraction towards the body it touches, and from whose body it rebounds, has no common ratio with the universal gravity of matter.

"It is not even proved that the rays of elementary fire do not penetrate each other. Newton, therefore, struck with all these singularities, seems always to doubt whether light be a body or not. For my part, if I durst risk my doubts, I must confess to you, that I do not think it impossible that the elementary fire may be a being apart, which animates Nature, and possesses the intermediate step between body and some other being we are not acquainted with, in the same manner as certain organized plants serve as a passage, or gradation, between the vegetable and animal kingdom."

Here are actually two species of immaterial being suspected by Voltaire—from necessity, too! He cannot otherwise account for natural phenomena. Every man but a fool sees, and feels, and is conscious, of the being of spirit; but here is something else—a trinity of being, of which matter is the lowest grade.

PUNISHMENTS.

THE opinions of men are undergoing a very rapid change in respect to punishment, as a means of preserving the peace of society, and the morals of mankind. Penal codes are becoming less sanguinary, and the prevailing spirit of the age is averse to the employment of cruelty and fear as the preventive of crime. This is a new idea. It is even taught by the clergy themselves. But what is very singular, these same teachers of mercy in political government do not perceive that religion must keep pace with civil government. The old creed of eternal punishments is dying along with the old sanguinary political statutes. The clergy have not nominally extinguished it; but it is seldom mentioned by the polite preacher, and it is esteemed a coarse and vulgar misdeed even to pronounce the word Hell in the pulpit. Many clergymen will not even name the Devil, the author of evil, and the keeper of Hell. What their object can be, or what may be their prevailing motive for so doing, we can only guess. Their faith is not very strong, and they know that a large proportion of regular church-going, baptized, self-nominated Christians, like themselves, have no hesitation in owing that they do not believe in hell. Still they are conservatives, and would shudder to alter the creed of the Church. But if the Church creed may not be altered, why should the penal code undergo a change? Religion must keep pace with social progress. Christianity has been so beautifully organized, that it will walk hand in hand with any system of policy, whether severe or merciful. It will descend to any depth, or ascend to any height. "With the froward I will show myself froward, but with the upright I will show myself upright."

CONVERSION OF HINDOOS.

The Friend of India contains the following letter from a native Bramin (Christian:—

"The renunciation of Hindooism by the youths of the Hindoo College, is now day by day getting new force, according to the progress and improvement of the students. If this grand institution continue successfully in its progress in this manner in Calcutta a few years more, and if the managers, the visitors, and the professors, take the same care as they are taking at present, then the students will no longer remain in the state of ig-

norance and superstition like their ancestors, who were considered no more than the savage beasts of the desert. Moreover, this will enable them to make a grand figure in the world, and show the example to their own country and to other nations. How many well educated and enlightened students of the senior classes of the College eat and drink privately those things which their religion forbids them, and they neither adore their gods and goddesses, nor do they bow to those pretended Bramins, who are the plague of truth! Further, many students of the first class have their full heart to embrace Christianity, but they are only prevented by the regulations of the College, for converted students are not allowed to read there. Fortunately, the parents of some students are now become liberal, like their sons, for most of them are well acquainted with their sons' character, yet they did not check nor prevent them in any way; rather, they indulge them in their favourite inclinations, which is to eat beef, and other forbidden things; and some of them advise their children to do privately whatever they like to do. How happy would it be for Calcutta, when all the parents become liberal like these, and give the same privileges to their promising sons!"—*Asiatic Journal*, Jan. 1838.

Liberality, both in Mahomedan and Pagan countries, has necessarily a sensuous beginning, on account of the importance attached to eating and drinking, in a religious point of view, and religious liberalism amongst the Jews would present the same phenomena. Christianity is a step in advance, though a similar attachment to forms pervades all its innumerable sects.

RELIGION OF THE NEW MORAL WORLD.—We invite the attention of our readers to an article on the Religion of the New Moral World, by the able editor of the *Shepherd*. There is manifested throughout the paper such an air of sincere belief in the principles advocated, of disinterested devotion to the best interests of the human family, withal such a kindly spirit, that it well deserves the attentive perusal and thoughtful deliberation of our friends and readers. We promise it both on our own parts, and shall, so soon as our numerous avocations permit us leisure, revert to the subject. Mr. Smith is either right or wrong upon the subject at issue; if right, we shall be benefitted by the discussion; if wrong, he will be benefitted by it; and, therefore, on both sides good grounds exist for its continuance. We take this opportunity of drawing the attention of our readers to the *Shepherd*, as a paper containing many strikingly original and useful papers, and calculated eminently to advance the best interest of man.—(From the *New Moral World*, of Jan. 13.)

CORN LAW RHYMING.—According to a letter from Crieff, in the *Glasgow Argus*, it appears that the people of Perthshire, having long been cooling in their political zeal, and despairing of obtaining redress of grievances by what is absurdly called Reform in Parliament, are once more roused to activity upon the Corn Law question. Repeal of the Corn Laws is now the word, and missionaries are kindling the flames of agitation. We wish them success, if it should put but a penny a-week into a poor man's pocket. But we see further than the Corn Laws. Their repeal will prove as great a delusion as reform. It will cheapen bread certainly, and enable us better to compete with other nations; but wages will fall in exact proportion, and the same distinction of rich and poor, splendidly comfortable and supremely miserable, will prevail. All these movements are like changing the inclination of a basin of water, the water always finds its level; or moving the box of a mariner's compass, the needle always point to the poles. It is an entirely new system of society that is wanted, but first of all a popular conviction respecting this new system, and the necessity for it. The world is too old now to be amused with the making and repealing of acts. Dissatisfaction will increase with every attempt to palter thus with the rights of man. We would sooner believe in the unknown tongues at once, than lean upon such broken reeds for deliverance. Political legislation is a hydra; if you kill one head, you find another as bad immediately in its place.

TO CORRESPONDENTS.

F.—It is the unavoidable tendency of extremes to beget each other. Any species of ultraism brings forth its corresponding counterpoise. It begets its own destroyer. The history of mankind affords sufficient proof of this. But self-conceit will take nothing but self-experience, and thus it goes through all the experience of former times, always confident of being right, till at last it dies in the conviction that it has lived in delusion, because it lived in self, by treating too slightly the experience of other men. Intercommunication of experiences is an essential feature of a state of concord. No man can have all experience. No man is a whole man, he is only a fractional man, a part of the great man—the species. Extremes are all pernicious to social happiness. The Mystic is merely the father of the Sensualist. Many children have their moral characters destroyed by the ultra-puritanism of their parents, and we could point out families who hate every thing that bears the aspect of religion, because their parents have been so over-anxious to inspire them with their own sectarian absurdities. Both Mysticism and Sensualism are seeds of social corruption. We take our stand between them, and sanctify the flesh by its marriage with the spirit. Materialism (single) we abominate as low, sensual, grovelling; but Materialism, sanctified by the spirit, is the resurrection of the body. Now, a man who makes a vow that he will not eat this, or drink that, is not the master, but the slave of matter. Temperance societies are doing much good, but they are merely one species of Ultraism rising up to counterbalance another. Perfection is between them; but it is the law of Nature, that when a weight is put into one scale, you must put an equal weight into the other to restore the equilibrium. The really virtuous man has the law within him which dictates the quantity and quality of his food. We can conscientiously declare that we never experience the slightest uneasiness from any thing we eat or drink; on the contrary, we are always refreshed with what we take, and we belong to no society, and have subjected ourselves to no other rule but the light within. After all we are genuine Mystics without presuming to call ourselves so. We are Materialists also, and Spiritualists; in other words, Universalists. With regard to animal food, a very intelligent reader of the *Shepherd* informed us, after reading the "Omnivorous Animal," that he had made the same experiment of abstinence, and continued it till he became so supple in the joints, that he could put his legs over his neck; he was very weak at the same time, and his fears compelled him to resort to his old diet. Our own experience is similar. In mature life any sudden change of that kind is very dangerous, especially with people in towns engaged in sedentary life, and living in a dense atmosphere. As for the conduit water of London it is full of vermin in summer, and muddy and insalubrious at all times. Genuine beer is the essence of grain, and is the most nutritive beverage a man can drink. A great variety of wines may be made from our own fruit, all nourishing and inspiring to body and mind; gifts of God which no man ought to despise, but use with moderation and thankfulness. We do not know much about an Ultra Mystic, but we hope he has more good sense, and that F.'s suspicion is wholly unfounded.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 31, Vol. III.]

SATURDAY, JANUARY 27, 1838

[PRICE 1d.]

INDIVIDUALISM.

Chorus.—Break the dance, and scatter the song;

Let some depart, and some remain.

Semi-chorus 1.—We beyond heaven are drawn along,

Semi-chorus 2.—Us the enchantments of earth retain.

Prometheus Unbound.

For the last two weeks we have been treating of the Christ, a most copious subject, which we have merely broached. There are numerous other aspects in which it might be taken up, all bearing a direct influence upon our favourite topic of universal and individual regeneration. Thus, for instance, we might discuss the important question which has lately occupied so much of public attention in the hands of the Irvingites—namely, the sinful nature of Christ, which, being answered by Irving in the affirmative, brought down upon his head the charge of blasphemy with which his followers are frequently loaded, even to this day. But in our hands it would be rendered perfectly synonymous with the human nature of Christ, which, as we have already observed, is fully developed in evil, and suffers all its penalties, and which may be regarded as either sinful, or not sinful, according to the view that you take of it, sinful as being human and imperfect, un sinful as merely fulfilling the mission upon which it was sent. It is childish to take either side. The man of universal views must necessarily take both, and by taking both he solves the riddle and removes the mystery.

A few days ago an intelligent reader of the *Shepherd* observed to us, that both we and our mystic friends were wrong. They in attaching too much importance to inward operations, and we in attaching too much to external circumstances. He afterwards observed, however, that he thought we erred more in our expression than our meaning. We did err in expression if we conveyed any thing resembling Materialism in meaning. But few readers of the *Shepherd* would ever suspect us of wading into this mire. They would search beyond the literal meaning of our words if they had such a tendency.

We cannot be responsible for the effects produced by words upon individual minds. We are frequently mistaken in our own apprehensions of other men's meaning, and we, like other men, are apt to be misunderstood, and especially by the casual reader. We cannot be always explaining and suckling. Yet a long course of suckling seems to be necessary, even according to the established laws of Nature herself, and the most useful teachers of men are probably those who dwell upon a single idea, and summon all their knowledge and their energy to illustrate and establish it.

What we call Individualism is a very important branch of Universalism. It is a universalism. The individual is a universe to himself. It is only in relation to himself that the universe has an existence to him. When *he* ceases to be, the *universe* ceases to be, in so far as he is concerned with it. Man, the individual, is, therefore, very poetically denominated a microcosm—that is, a little world. The fate of the species is a subject of minor consideration, if we ourselves are not personally concerned in it. Little does the melancholy suicide care for the fate of empires, of corn laws, and poor law amend-

ment bills—his race is run. He looks not back upon time, but with a nervous and hysteric sneer, he laughs at the miseries of the world he leaves behind him, quietly observing, like the German illuminés "*janua patet*"—"the door is open," they may walk out like me when they can endure it no longer. It is only when the link is strong that associates the selfish with the social feeling, that the social feeling can have a being, *for it is self that experiences the social feeling.*

It was shrewdly observed by our Transcendentalist last week, that the "*I*" could not have an existence without that which surrounds it. A candle could not burn if not surrounded by the elements of combustion. Our conscious principle is similarly circumstanced. It is solely at the mercy of the element it lives in. But it is for its own sake in the first and last place, that it regards that element as either good or evil, and inquires into its durability and its destiny. In its *a priori* process of inquiry it begins with the elementary being in which it lives and moves. It then descends to the creations of that elementary being, and in descending it finds the human species before it finds itself. It seeks the destiny of man as a species, and having satisfied itself upon this point, it discovers its own as a member of the human family. This is the most logical and conclusive method of investigating the destiny of man. Some, however, prefer the Cartesian system, and make the earth "*I*" the centre of the universe. They go to work with "*I am*," and from this central point they spread themselves out to infinity and eternity. This is the philosophy of what is called by some the self-centred being. This is an *a posteriori* process. It begins with an effect, and leads up to a cause. This also is natural. No man can avoid thinking after this manner. And, probably, no man ever existed who did not thus reason. Both these modes are, therefore, very simple.

But the grandest discoveries, and the most sublime and heart-cheering truths are, in our opinion, to be discovered by the former method. By the former method we begin with a self-existing being, all-wise, all-mighty. We discover that being engaged in the production of a graduated scale of created intelligences, we infer the purpose of the Creator from the great analogies of his works as we descend into their detail, and having discovered the destiny of the genus, we infer that of the species, and from that of the species we deduce the fate of the individual. But in beginning with self, we only ascend to the universal cause, and we continue ascending for ever, and discover nothing. It is by descending alone that our discoveries are made. The individual, therefore, is the last object we come to. But though last, it is to each one the most important. It is the first and the last.

In reasoning, *a priori*, I find that God has created man with a rational soul, and a species of infinite mind—a little image of deity. I become satisfied of man's immortal destiny, and thus rejoice in my own. This conclusion is much more satisfactory to me than the solitary conclusion resulting from my own individual mind. Were all the human species Materialists but myself alone—were the earth alone the centre and circumference of their hopes, and their minds entirely engrossed by sensual pursuits, without even the capacity for receiving abstract ideas—had I no companion in my feelings, no sympathy

amongst my species with the infinite and insatiable desires of my imagination, my hope of immortality would be feeble in comparison of what it now is. It is because the hope is generic or universal, with a few solitary exceptions, that it becomes a moral certainty to the contemplative and religious mind. Individualism, therefore, is, in this view of the subject, the child of Universalism. But who is it that thinks all this while? It is an individual, and the Universalism exists in that individual. How, then, can the Universalism be the parent of that which contains itself? It is the *idea* of Universalism only that the individual contains, and in that idea the idea of Individualism is comprised, even as the individual himself is comprehended in the universal mind of God. When an individual reasons *a priori*, he begins with the *idea* of the universe at once; he reasons *a posteriori*, when he begins with the idea of himself.

Our favourite mode of reasoning on universal subjects is the *a priori* method. Hence we descend to the self-centred being at last. We have long and often treated of the destiny of the species—the universal plans of Providence regarding the species. We have foreseen and foreshown a system of terrestrial regeneration on a large scale, embracing individuals and thus effecting their regeneration by the simultaneous process of “a nation born in a day.” We have denied the possibility of individual regeneration, upon the principle that the human species is a unity and the individual merely a fragment or member of the unity. As it is impossible for one limb to be happy whilst its fellow is miserable, so the individual man, however he may deceive himself, is always affected by the misery and the corruption of his companions in life, or his fellow sojourners in time and place. Individual improvement we admit of to any possible extent in a dismembered or selfish system. But wherever a man lives in an individual money or property interest, or in an intellectual or religious frame of mind, in which he condemns or pities or offends his fellow man, regeneration is merely a cant phrase. In this sense it has been claimed by men of every shade of character, moral and intellectual, from the highest saint down to the lowest sinner.

Supposing regeneration to be comparative, we have no objection to admit of regeneration as implying that new state of mind by which a man enters upon the conviction that a higher sphere of being is destined for him than this material scene, that a higher order of being than intellect is necessary for the purification of society, and that a higher system of education than mere individual proselytism, lecturing and schooling, is necessary for the production of a good moral Nature. A man in this state of mind is above matter. He walks not after the flesh, but after the spirit, and “therefore” as an Apostle observes “there is no condemnation for him.” But this is merely the beginning of life, it is but the leaping of the child in the womb. The old man is still the *major-domo*. The heir may be born, but he is not of age. So far we are willing to go with the mystics, and in this sense we ourselves are born again, and perhaps (but we cannot judge for ourselves, and we are not inclined to submit to their arbitration) we are as far advanced in the new birth as any of them. We would rather, however, be silent upon such a subject.

There is one very important fact connected with the history of every individual, and that is, that although we may all contrive to universalize our mode of existence during life, by the amalgamation of interests, and a full communion of social feeling, we must all and each go out of life *alone*. Now death is a most important subject to think of. They are not the finest minds who do not muse upon it. It is the prerogative of man to meditate upon his final doom. We have no reason to believe that any other animal is capable of doing this. To suppress this tendency or faculty, therefore, is a dereliction of duty; it is a violence to Nature, and the result is moral castigation, a rusting of the feelings. But there is little fear of its suppression being very general; it is too intimately connected with individual interest; it is the climax of individual hope in this world, and the epoch at which our new destiny commences. It is interesting at all times to inquire what is to become of the thinking principle; but even when that is determined, which, as we have said above, is accomplished by the *a priori* process, there is another question, an *a posteriori* question of individual importance,

which absorbs the interest of contemplative minds more keenly than that of the general proposition of a prolongation of existence, and that is the individual condition or relationship in another state of being.

In our present terrestrial state, our individual condition is always of the first importance. We are all anxious after happiness. We love domestic comfort, ease, and independence. But our fate is partly sealed by birth. We have, in fact, become familiar with it, and in general we can forecast the general outline of our destiny, that is, our future rank in society. Not so with our after being; that is a complete mystery. We are not yet born into that world. Does the nature of that new birth depend on our spiritual and moral being in this life? If so, how important to all of us is the individual relationship which we bear to the author of our being, or in other words, the standard of moral good. As we rise here, we shall rise hereafter. We know nothing more ennobling to the human mind than this consideration. It belongs always to the noblest and the finest spirits. The sublime in virtue can never be attained without it. There is a coarseness and meanness about even the most disinterested acts of patriotism and public moral, which are not sanctified by this extreme unction of the spirit. No man will ever exercise an extensive influence over the minds of his fellows, who is not deeply penetrated by this religious feeling. No man can ever play the sweetest music of poetry upon the human heart without it. It is not till the caterpillar is clothed with wings that we esteem it clean. All the inhabitants of the air are comparatively pure, but reptiles and insects, that crawl and dig in the dull and dark earth, are not only nauseous to our feelings, but allegorically employed as emblems of moral and spiritual degradation. What is this but a lesson of Nature? and why will the pupils and the students of Nature refuse to learn it? Because those who call themselves the lovers of Nature are like those self-denominated lovers of God—a self constituted elect, whose element of being is delusion and conceit.

A man cannot go too far in his imaginations respecting the destiny of the human race, and there cannot be a nobler ambition than that of striving individually to rise in the scale of being. We do not complain of mystics going too far. We never met one who went far enough for us. We complain only of metaphysical subtleties, eternities, and infinities in the mystic lore. We have already observed, that eternity and infinity can only be conceived by man by means of time and space. Time and space are our sphere. We cannot go out of them, nor imagine ourselves out of them. We can have no idea of any thing out of them; we can only talk of things out of them. This the mystics do, and therefore talk what no man can understand. We neither call this high nor low, deep nor shallow. They call it going centre-ward. Voltaire says, it is the property of matter to go centre-ward—of light, to go *from* the centre.* The centre is self, the speculum which reflects the light which God sheds upon it from around. But, whatever it be, and we are not disposed to fall out with any man about it, of this we are fully certain, that every man is a little vortex, or whirlpool, in which a certain amount of external influence is concentrated, and that the whirlpool is deep, large, or powerful, in proportion to the velocity and magnitude of the confluence. His very being depends on the being that surrounds him: to talk of central independence, and power emerging from the centre, independent of that which acts upon it, is very wild. The centre is the point of confluence, a mere creature of the rush from the circumference. The taper burns dull or brilliant, in proportion to the purity and density of the oxygen that surrounds it; put it into nitrogen, and it dies—into hydrogen, it causes an explosion—into pure oxygen, it burns with a vivid glare, and is speedily consumed. So it is with man; and thus man ought to be considered. It would not be more foolish to talk of the taper burning in a vacuum, than of man forming his character in a vacuum, independent of outward things. And as the fire-worker makes his flame burn blue, red, or yellow, by the gas which he administers, so also does the

* It is singular enough that this tendency of matter is similar to that of uncreated light towards the Sun.—See the article, “Theories of the Universe.”

human character develop itself according as it is centrally acted upon by the elements of spiritual influence from without.

What amount of self-determining power the will has, or if it has any, is probably a question which never can be solved; but it is certainly practically necessary in the intercourse of society, to regard man as being possessed of some species of self-energizing power, but that power is *always* connected with an outward phenomenon, as a moving principle, the moral influence of society, the pressure from without, or the more inward, though still outward, phenomenon of self-exaltation in moral being; for even the contemplation of one's own spiritual promotion in another world is an outward circumstance to the imaginative mind, which can have no idea of rising or falling, except by comparison with surrounding objects. A mere inward state of being, or feeling, or contemplation, is impossible. We exist, as T. says, because what is around us exists; we feel, because what is around us acts upon us; and we think, because we perceive phenomena which are beyond us, and objective to our perceiving minds.

We, therefore, unequivocally and solemnly deny the possibility of the Mystic's inward, or rather inner (for Bromley, in his "way to the Sabbath of rest," makes a distinction) condition. Mysticism, which asserts it, is therefore mere verbiage, without meaning. But that mental or spiritual contemplation which luxuriates in the imaginative destiny of the species, to which we have already alluded, is, in our opinion, the nobility of the human soul—the poetry of thought—the temple of science, in which all knowledge must bow down before the altar, and acknowledge itself a minister of the sanctuary, and as only useful and nobly employed when presenting its offerings, and decorating the sacred fane of Eternal Faith, Hope, and Charity.

THEORIES OF THE UNIVERSE.

THERE is a wide distinction between theory and demonstration, but theory always precedes demonstration, and seems to be necessary to carry it out. The imagination is the precursor of the judgment, and never can the judgment determine with certainty a universal fact which the imagination has not previously conceived. The demonstrations of Newton were only the attendants of the fancy of Copernicus. The latter conceived in theory what the former proved to be a fact. The imagination is the noblest faculty of the mind. It is the creative faculty—that faculty which gives to man his sonship and constitutes him the image of God as a secondary Creator. Imagination and genius are synonymous.

We despise all men who despise theories; but we despise all theories which are mean and base and beneath the dignity of the subject contemplated. The universe is a sublime subject; a theory of the universe must be sublime; but the more sublime it is, the more likely is it to be true. The old notions of the universe are very grovelling. To make the earth the centre of the celestial sphere and its movements, the only habitable ball in existence, is so very contemptible, that it is now too little for a schoolboy's genius. Nothing but infinity will satisfy the modern mind for a theory of the universe; but as the universe is rather too great for our little minds, we now find it very convenient to substitute the solar system for the universe. This is an emblem or type of the whole, and embraces all with which we have immediate correspondence.

M^rIntosh, in his Electrical Theory of the Universe, represents the sun as the parent of the planets, the source from which they spring, and the grave in which they are finally buried; thus preserving the analogy of our own relationship to the earth. This seems plausible, because it is simple and natural, but we have an insuperable objection to all theories which represent light as a material fluid. It is neither ponderable nor measurable. It has nothing of the nature of a gas about it. There is an infinite distinction between the maximum subtilty of any known matter and the subtilty of light. Moreover, matter is all naturally motionless or susceptible of rest, but light is motion itself, the very opposite extreme of materiality, and to represent it as a property of matter is unwarrantable. It is equally probable that matter is a property of light.

It may be objected to this that matter produces and emits light. This is a mere vulgar illusion. The philosophic mind

will not rest satisfied with the vulgar idea that the sun begets light. It is much more probable that light begets the sun. This idea we know is somewhat singular, but it is the only final hypothesis on which the inquiring mind can rest. Light is omnipresent, but to us material beings it can only become visible by means of a material speculum. The solar matter is that material speculum, and thus the process of creative light commences, diffusing itself through planetary matter and producing all the phenomena of chemical action, vegetation and life. This is not a mere supposition; we know that the flame of a candle is only a speculum for the quiescent element of light that surrounds it. To produce that speculum, two gases or elementary species of matter are requisite, and by their means the light becomes visible or materialized. But the original or immaterial light is creative darkness—"The Lord loveth to dwell in the thick darkness."

A sun and a planet are therefore two species of matter charged with opposite polar electricities, the sun being the positive, the planet the negative pole. This brings us to M. Chardel's theory as illustrated by Mr. Colquhoun, in an appendix to his *Isis Revelata*. This theory recognises two physical principles,* the terrestrial and the solar—matter and motion. "Matter is that which constitutes the consistence of bodies. The rays of the sun unite with matter, and are the sole and ever active principle of motion. It is they which constitute the life of beings, for life is the cause of organic motion in vegetables and animals. "In the beginning was the word, and the word was with God," and the word was God. The same was in the beginning with God. All things were made by him, and without him was not anything made that was made. In him was life, and the life was the light of men, and the light shineth in darkness, and the darkness comprehendeth it not." "God is light." Light is a Spirit. The sun is not God, but it is the speculum by which he is made perceptible to men, even to the blind who feel him. It is God materialized—the image of God; the Son of God, by whom all things are created. The Father is invisible, he is the uncreated light.

Light is the soul of the world; and the eye, the organ of light, is (poetically) the soul of man. Matter is invisible. Light only is visible. Matter is the element of eternal uncreative darkness, but that element of eternal darkness has the property of reflecting or repelling the light, and thus giving itself a visible existence. We have no objection to give tangibility to matter, but visibility is utterly opposed to materiality in every sense of the word. The reason is obvious; tangibility is the result of immediate contact, but visibility can exist between objects at an indefinite distance. Visibility is immaterial, or spiritual contact, effected by means of an immaterial or spiritual being acting upon a material speculum.

A mind is a solar creation, a body is terrestrial. "The first man is of the earth, earthy; the second man is the Lord from heaven." That which belongs to the earth returns to the earth, but that which belongs to the sun must thither go.

We to our Father's house return,
There numerous mansions stand;
And glory manifold abounds
Through all the happy land.

M^rIntosh in his theory represents the planets as returning to the solar fire, and undergoing decomposition and resurrection, by an eternal process of evaporation and solidification, like the formation of rain drops. This may be very sublime, but it is very horrific, if this be all; it is merely a material theory, and as such is low and grovelling. No theory of the universe can begin or end with matter; matter is merely the sphere of spiritual action, nothing else can ever be made of it. But so far as M^rIntosh goes, we believe he is right. The analogy of Nature, which is the only guide for theoretical inquiries, clearly points to it as a magnificent fact. It is the end of this terrestrial system to be cast into the lake of fire in which the ashes of all men will be consumed. "Yet they themselves shall be saved, yet so as by fire." The planets have the elements of their own consumption around them. Each planet is wrapped in its own

* The word physical means *natural* not *material*.

winding sheet. The atmosphere of a planet is its destroying angel. It will become a scorching tempest which will wither every green herb, and destroy every living thing.—“Then the heavens shall pass away with a great noise, the elements shall melt with fervent heat, the earth also and the works that are therein shall be burnt up.” “And there shall be a new heavens and a new earth, wherein dwelleth righteousness,” the solar orb.

This view of the mysteries of religion is in perfect harmony with science, and is, in so far as its material aspect goes, imagined and embraced by materialists themselves. We generally go along with enlightened materialists so far as they do lead us in positive philosophy; but when they begin with their negatives and vacuums, we leave them in the void of their own creation, and march on before them. A materialist is a sort of universalist, but he lives in the cellars, or the ground floor at the highest. He may enjoy the kitchen and dining-room of Nature, but he never ascends to the drawing-room. The dining-room is consecrated to the belly. The drawing-room is devoted to imagination. It is always the finest apartment. The dining-room is a male apartment. It is the scene of male conversation and intellectual contention. The drawing-room is woman's empire, where all strife should cease, and poetry, music, painting, and all the muses and graces should preside, and where the genius of fancy has unlimited scope to spread out his wings and take his aerial flights. Even this affords us an analogical lesson. We see the universal spirit in all these little things regulating Nature even in the minutest and most trifling details, according to one eternal and immutable idea of harmony which we ought diligently to seek and religiously to follow.* This is the music of the spheres.

* The bed-rooms above are mysticism, a sort of sleepy condition which has no appetite for the dining-room, and is rather beyond the drawing-room, in its tendency to dive into the spiritual world *without the body*. We like them all, we insist upon having all.

MR. GASKELL, MR. OWEN, AND THE WORKING MEN.

TO THE EDITOR OF THE “CHELTENHAM FREE PRESS.”

London, Jan. 2, 1838.

SIR,—In your *Free Press* of the 23d of Dec., I find the following words attributed to Mr. Gaskell, and addressed by him to the “Working Mens’ Association” of Cheltenham:—“I, for my part, believe that the working classes have a deep interest in the maintenance of the institution of private property. The notion of a community of property is too complex, impracticable, and *repugnant to the selfish nature* of man to find favour in the eyes of any but a mere fraction, whose heads are rather crotchety.”

The literal meaning of this sentence is, that the present system is so palatable to the selfish nature of man, that it must be continued.

Yet Mr. Gaskell wants a reform of the present system, and that reform is one which throws all the burden of Government upon private property.

If property be agreeable to the selfish nature, it must be very “repugnant to the selfish nature” to lay the whole burden of taxation upon it.

Mr. Gaskell's own reform, therefore, being repugnant to the selfish nature, his argument is inconclusive, until he can point out precisely the exact proportions in which the selfish and social nature divide the empire of society between them, and which of the two is the lord paramount.

As to complexity—surely there can be nothing more complex than the present system, which neither legislator, divine, nor attorney, nor even Mr. Gaskell can comprehend. Its impracticability is equally manifest. Corruption creeps forth from every pore, and every institution fails of its object. The very best intentions are thwarted by the selfish root of bitterness, upon which men have grafted many virtuous resolutions.

Even charity and philanthropy themselves are cursed and defeated by the complexity and impracticability of the selfish system; so that every establishment, however cautious its rules however pure the principles of its founders and guardians, becomes a bed of wickedness, on which wounds, and bruises, and putrifying sores arise, and speedily call for the operation of reform.

The beauty of the social system is its *simplicity*. It removes the plant of corruption by removing the root.

What does Mr. Gaskell mean by the institution of private property? The right, we suppose, of every man to appropriate as much wealth as he can heap together, and as many fields as he can seize hold of by policy, craft, manœuvre, industry, commerce, or quackery. In fine, it is an institution for *feeding* the selfish and *starving* the social nature.

What is the moral value of this institution? A man becomes a master and distributor of the means of subsistence to others. They hang about him like parasites—they surround him in livery—they flatter and caress him, and move him to surrender his wealth by artifice. *He* becomes dignified—they become indignant. *He* becomes proud—they become mean and humble. *He* becomes a man of honour—they become *fellows* who will sell their caresses, *sometimes* their consciences, for a bit of his money. Thus vice and virtue become in some measure distributed in the same proportion as wealth, and thus it follows that the certificate of a poor man is not worth a farthing.

I do not say that there are no exceptions, but the whole history of trade, commerce, and electioneering, demonstrates that this grasping at private property, this greediness of gain, is the assassin of the conscience.

How, then, does Mr. Gaskell propose to preserve the conscience? By cheap bread, cheap government, and *sound* education.

This I cordially agree with. But it is very vague. What is the meaning of *sound* education? Here lies the whole difficulty. The greatest rogues in London are clever, well educated men. Not long ago I was speaking of one to a friend, and observed that I was afraid he would come to a disgraceful end. His reply was, “There is no danger, he *knows* his game too well.” Education roguery is the most vexatious of all. It is like greasing a pig's tail; there is no catching an educated rogue. Every man in business knows such men, and lawyers understand me well. To educate men scientifically therefore, that is, by reading and writing, and the confusion of periodical literature, and *here to cease*, will only produce a more refined and cruel system of immorality. Cheap bread is not enough for an educated rogue. He is insatiable. He is not even a sensualist—he is sometimes an abstainer and a tee-totterer. His extravagance is imaginative and ostentatious, but there is no limit to his desires.

I ask any man in business this plain question—What class of individuals gives him and his family the greatest annoyance—the educated or the uneducated rogues—those who pick the pockets *directly* and rob by violence, or those who pick *indirectly*, and rob with impunity by the artifices of trade?

Pick-pockets seldom cause a family to mourn. But the misery inflicted by educated rascals is beyond calculation. Were all the 20,000 yearly culprits reduced to none, and all our criminal courts idle for want of “crime,” we should not in a social and domestic capacity know any difference. Nay, were all the drunkards in the country to be instantly converted into sober men, the frauds of trade would probably be more numerous than ever. The most expert deceivers and destroyers of social and political peace, are neither drunkards nor boors. They are gentlemen—not of the Aristocratical order, for these being above commerce, have nothing to do but spend—but intriguing gentlemen, schemers, plotters, bubble mongers, speculators, men of *sound* education. Should you like to multiply the species, Mr. Editor? Then give the people a *sound scientific* education, and let the heaven work.

I speak not in favour of either drunkards, pickpockets, or boors. I merely say there are greater devils than these, and of these greater devils Mr. Gaskell is the champion.

Now, Mr. Owen attacks the great devil himself. His is a

grand *a priori* process. Instead of assailing the heads of the hydra, he merely pierces its heart.

That community would put an end to crime there can be no doubt. But how far it would be necessary to carry community can only be determined by experience. But it must begin with public property in land. Mr. Gaskell's property tax is a species of community. That this will not put an end to crime needs no proof. This was the original revenue of the country when men ate one another. Where then would he stop? When he has refined the system of roguery by science, by reading, writing, and skill in the *arts* of life, what next will he do? This *sound* education is not sound enough. The clergy can do nothing. The fear of the devil has lost its hold. Moral lectures are very dry. In fine, it is discovered that another species of education, entirely new, is required, and that is *moral* education.

Moral education is not given by words either spoken or written. The very meaning of the word "moral" is "manner." A moral education is a *dumb* education. It is the result of position and relationship acting secretly on the moral sense. It is the produce of the *sympathy* of society. Put a child among Thugs—he grows up a Thug by sympathy. Put him among thieves—he grows up a thief by sympathy. Put him in a world of intrigue where a living is obtained by secrecy, cunning, and deception—he becomes a deceiver by sympathy. This sympathy is the moral teacher, the soul of society. If the system of society be selfish, the sympathy is selfish, and the "moral teacher" is the devil, in spite of your schools and your lectures. If the system be social, the sympathy is social, and its *repugnancy to the selfish nature* is not experienced as an evil, because the selfish nature is not in the ascendant. You might preach *immorality* in such a system—it would not take effect. By defending the selfish system Mr. Gaskell defends the system of immorality, and his *sound* education is nothing else but *intellect versus morals*.

This moral sympathy of which I speak, is an inspiration from universal society, an omnipresent teacher. It preaches continually in a man's soul. It thrills his nervous system. Who has not felt it in the company of the good? Lectures and science are paltry substitutes which few can listen to and fewer understand. But this moral sympathy with a system of social justice, is a divine influence of social and *personal* satisfaction which will put all lecturing and science to shame. What is your feeling your sympathetic feeling, Mr. Editor, when you walk the streets of a great city? Is it not revolting to your social nature, nay, even to your personal satisfaction? Does not the city seem a huge temple of deceit, a manufactory of wickedness, where each individual is congratulating himself at another man's expense, and raising his own fortune on the ruins of his brother's? Is there anything humane or divine in this? Can even the individual virtues be pure that are cultivated in such a soil? Must they not necessarily be corrupted by the filth at the root? Change the scene, and imagine the whole soil to belong to the collective people, every man at work for himself and for all, possessing a moral right *through labour* to education, good food, clothing, lodging, and recreation: how different the sensation! how intense the feeling of fraternity! how close the idea of relationship! Every boy and girl, every child would *feel* it. There would be no need of going to the lecture room to *learn* it. It would spring in the soul like a well of living water, it would feed the social, aye, and the selfish nature with the bread that perisheth not, that corrupteth not. "It would cover us with its feathers, and under its wings would we trust."

The working men will be deceived if they trust either to politicians or scientific lecturers. Poor fellows! they cannot save themselves. The learned and the educated are the most unhappy of all men in a social or domestic capacity. Science is good and useful to man collectively, but individuals cannot *all* pursue it. The moral sympathy is for *all*, even for the infant as well as the philosopher. This only is the saviour. There is only one way of cultivating it, viz., by a sympathetic system.

Let the working men of Cheltenham think seriously on these things, and I have no doubt that they will perceive that Mr. Gaskell and his class, see no farther than the ditch.

A SOCIALIST.

P.S. It is scarcely necessary for me to say, that it is contrary to the principles of Socialism, to employ other than *intellectual* and *moral* persuasion to promote the social system. The possessors of property have, therefore, nothing to fear from Socialists. They have more to fear from Radicals, who being taught by Cobbett (see his "Legacy to Labourers") that the land legally belongs to the people, would have no conscientious scruples about a re-distribution. This, the Socialist would oppose with all his vigour, as re-establishing the selfish system upon a still more selfish footing.

The present object of the Socialists is to present a model as an inducement for others to follow their example. The Radicals will wear out their lives roaring for Reform. The Socialists are endeavouring peacefully and legally to *make* it. Both parties may mutually aid and encourage each other. But when a Radical brands a Socialist as "crotchetty," he must expect a rejoinder—a rejoinder too, which must make him seem a very suspicious character, both to the working men and the possessors of property.

EGYPTIAN MANUFACTURES.

(From Wilkinson's *Manners and Customs of the Ancient Egyptians*: 1838.)

"ONE of the most remarkable inventions of a remote era, and one with which the Egyptians appear to have been acquainted at least as early as the reign of the first Osirtasen, upwards of 3500 years ago, is that of glass-blowing. The process is represented in the paintings of Beni Hassan, executed during the reign of that monarch, and his immediate successors; and the same is again repeated, in other parts of Egypt, in tombs of various epochs. The form of the bottle, and the use of the blowpipe, are unequivocally indicated in those subjects; and the green hue of the fused material, taken from the fire at the point of the pipe, cannot fail to show the intention of the artist. But if the sceptic should feel disposed to withhold his belief on the authority of a painted representation, and deny that the use of glass could be proved on such evidence, it may be well to remind him that images of glazed pottery were common at the same period, that the vitrified substance with which they are covered is of the same quality as glass, and that therefore the mode of fusing, and the proper proportions of the ingredients for making glass were already known to them; and we can positively state, that two hundred years after, or about 1500 B.C., they made ornaments of glass; a bead bearing a king's name who lived at that period having been found at Thebes, by my friend Captain Henvey, R.N., the specific gravity of which, 25 deg. 23 min., is precisely the same as of crown glass, now manufactured in England. Many glass bottles, and objects of various forms, have been met with in the tombs of Upper and Lower Egypt, some unquestionably of very remote antiquity, though not readily ascribed to any fixed epoch, owing to the absence of royal names indicative of their date; and glass vases, if we may trust to the representations in the Theban paintings, are frequently shown to have been used for holding wine, at least as early as the Exodus, 1490 years before our era."

"Such, too, was the skill of the Egyptians in the manufacture of glass, and in the mode of staining it of various hues, that they counterfeited with success the amethyst and other precious stones, and even arrived at an excellence in the art which their successors have been unable to retain, and which our European workmen, in spite of their improvements in other branches of this manufacture are still unable to imitate; for not only do the colours of some Egyptian opaque glass offer the most varied devices on the exterior, distributed with the regularity of a studied design, but the same hue and the same device pass in right lines directly through the substance; so that in whatever part it is broken, or wherever a section may chance to be made of it, the same appearance, the same colours, and the same device, present themselves, without being found ever to deviate from the direction of a straight line, from the external surface to the interior. This quality of glass, of which I have seen several specimens, has been already noticed

by the learned Winkelmann, who is decidedly of opinion that the ancients carried the art of glass-making to a higher degree of perfection than ourselves, though it may appear a paradox to those who have not seen their works in this material.' He describes two pieces of glass, found at Rome, a few years before he wrote, which were of the quality above mentioned. 'One of them,' he says, 'though not quite an inch in length, and a third of an inch in breadth, exhibits, on a dark and variegated ground, a bird resembling a duck, in very bright and varied colours, rather in the manner of a Chinese painting than a copy of nature. The outlines are bold and decided, the colours beautiful and pure, and the effect very pleasing; in consequence of the artist having alternately introduced an opaque and a transparent glass. The most delicate pencil of a miniature painter could not have traced with greater sharpness the circle of the eyeball, or the plumage of the neck and wings; at which part this specimen has been broken. But the most surprising thing is, that the reverse exhibits the same bird, in which it is impossible to discover any difference in the smallest details, whence it may be concluded that the figure of the bird continues through its entire thickness. The picture has a granular appearance on both sides, and seems to have been formed of single pieces, like mosaic work, united with so much skill, that the most powerful magnifying glass is unable to discover their junction. From the condition of this fragment, it was at first difficult to form any idea of the process employed in its manufacture: and we should have remained entirely ignorant of it, had not the fracture shown the filaments of the same colours as on the surface of the glass, and throughout its whole diameter, passed from one side to the other; whence it has been concluded that the picture was composed of different cylinders of coloured glass, which being subjected to a proper degree of heat, united by (partial) fusion, I cannot suppose they would have taken so much trouble, and have been contented to make a picture only the sixth of an inch thick, while, by employing longer filaments, they might have produced one many inches in thickness, without occupying any additional time in the process; it is, therefore, probable this was cut from a larger or thicker piece, and the number of the pictures taken from the same depended on the length of the filaments, and the consequent thickness of the original mass. The other specimen, also broken, and about the size of the preceding one, is made in the same manner. It exhibits ornaments of a green, yellow, and white colour, on a blue ground, which consist in volutes, strings of beads, and flowers, ending in pyramidal points. All the details are perfectly distinct and unconfused, and yet so very minute, that the keenest eye is unable to follow the delicate lines in which the volutes terminate; the ornaments, however, are all continued, without interruption, through the entire thickness of the piece.' Sometimes, when the specimens were very thin, they applied and cemented them to a small slab of stone of their own size, which served as a support at the back; and by this means they were enabled to cut them much thinner, and consequently to increase their number. Two of the most curious specimens I have seen of this kind of glass have been brought to England."

LINEN.

"The quantity of linen manufactured and used in Egypt was truly surprising, and, independent of that made up into articles of dress, the great abundance used for developing the mummies, both of men and animals, shows how large a supply must have been kept ready for the constant demand at home, as well as for that of the foreign market. That the bandages employed in wrapping the dead are of linen, and not, as some have imagined, of cotton, has been already ascertained by the most satisfactory tests; and, though no one, even among the unscientific inhabitants of modern Egypt, ever thought of questioning the fact, received opinion in Europe had, till lately, decided that they were cotton; and it was forbidden to doubt that "the bands of *byssine* linen," said by Herodotus to have been used for enveloping the mummies, were cotton. My own impression had certainly been that the mummy cloths were invariably linen; but positive experience had not then confirmed my opinion, and I reluctantly yielded to the universal belief,

and concluded that some, at least, might be cotton. The accurate experiments made, with the aid of powerful microscopes, by Dr. Ure, Mr. Bauer, Mr. Thompson, and others, on the nature of the fibres of linen and cotton threads, have shown that the former invariably present a cylindrical form, transparent, and articulated, or jointed like a cane; while the latter offer the appearance of a flat ribbon, with a hem or border at each edge; so that there is no possibility of mistaking the fibres of either, except, perhaps, when the cotton is in an unripe state, and the flattened shape of the centre is less apparent. The results having been found similar in every instance, and the structure of the fibres thus unquestionably determined, the threads of mummy cloths were submitted to the same test, and no exception was found to their being linen, nor were they even a mixture of linen and cotton thread. The fact of the mummy cloths being linen is therefore decided. It now remains to inquire into the nature of the *byssus* in which I confess considerable difficulty presents itself, owing to the Hebrew *shash* being translated *byssus*, in the Septuagint version, and, in our own, "fine linen," and to *shash* being the name applied at this day, by the Arabs, to fine muslin, which is of cotton, and not of linen; for the similarity of the words in these cognate languages argues in favour of the same meaning. On the other hand, Herodotus says the mummy cloths were "of *byssine sindon*," and they are found to be invariably linen: he uses the expression "tree-wool" to denote cotton; and Julius Pollux adopts the same name, distinguishing it also from *byssus*, which he calls a species of Indian flax. The use of the two words *byssus* and *linen* present no difficulty, since they might be employed, like our flax and linen, to signify the plant, and the substance made from it. Cotton cloth, however, was among the manufactures of Egypt, and dresses of this material were worn by all classes."

WONDERS—NATURAL AND UNNATURAL.

THE following extract from Colquhoun's "*Isis Revelata*," is a plausible attempt to account for many singular historical facts upon the principles of animal magnetism. But it goes but a little way. There are many in reserve, which must either be brutishly denied, or accounted for upon other principles. The remarkable cases for instance of witchcraft, or supposed witchcraft, related by Sennertus, the celebrated physician, by Cornelius Gemma, Wierius, &c., of individuals vomiting stones, coals, pieces of wood, balls of hair, feathers, and even pieces of dog's tails, and subjected to the strictest vigilance to see that such articles were not in a fit of delirium received into the mouth, are not to be accounted for by animal magnetism, even admitting all that is recorded of it to be true. A well known case of this kind happened in Scotland to a baronet's daughter, Catherine Shaw, of Bargarran, and was submitted to a public trial with the most respectable medical and other testimony. The girl pulled straw, hay, coals, and feathers, and almost every species of rubbish out of her mouth, under the most grievous sufferings. Such things as these have never yet been accounted for. And to say that they are not true, because they do not happen now, is merely to assert what science itself proves to be a lie, that there are no extraordinary epochs in time in which Nature exerts an extraordinary power and afterwards resumes her usual repose. Fossil geology proves that there are such epochs. Modern excavations are all confirming the common testimony and traditions of ages, and faith instead of being diminished, is really being enlarged by discoveries. Nature accommodates herself to the state of the human mind. In an age of superstition and credulity, real wonders will happen, because it is a proper sphere for them. The wonders and the credulity mutually beget other; but in an age of incredulity, they will naturally cease, because the faculty that begets and attracts them is not developed.

"Among the oriental nations, the cure of diseases by the application of the hands, appears to have been well known. The Chaldean priests are said to have practised this mode of treatment, as also the Indian Brahmins, and the Parsi. According to the accounts of the Jesuit missionaries, for the year 1763, the

practice of curing diseases by the imposition of hands, has prevailed in China for many ages. The theory of animal magnetism, indeed appears to have been known in the East long before it was thought of in Europe. It is said that, there are individuals in Asia, who make the practice of that theory their profession, and that these persons are persecuted by the Mullahs.

"When we reflect that, after the fall of the Roman Empire, literature, science, the arts, medicine, &c., took refuge in the monasteries; might we not be led to suspect that many of the secrets and practices of the ancient Egyptians, the Greeks, and the Romans, which had always been confined to the temples, may have passed into the monasteries which succeeded them, and that in them the magnetic medicine had been mysteriously preserved. Indeed, we have pretty good evidence that this was certainly the case. Thiers tells us, that Protogenes, priest of Edessa, cured the children, his pupils, by prayer, and *the touch of his hand*, and that the monk John, had received from God the gift of curing the gout, and of replacing dislocated limbs. The monk Benjamin cured all kinds of diseases by the touch of his hand, and anointing with holy oil, &c. Petrus Thyraeus, the Jesuit, in his work, entitled *Demoniaci hoc est de Obsessis*, &c., refers to a number of cures performed by ecclesiastics by the imposition of the hands, and by other means analogous to the magnetic.

"If we admit to any extent the efficacy of these manipulations, and give any degree of credit to what has been alleged in regard to the efficacy of human volition, we shall have the ready means at hand of explaining in a pretty satisfactory manner, many of those extraordinary cases which have served as a foundation for the popular belief in witchcraft, sorcery, possession, &c.; a belief which has led to many absurdities in speculation, and occasioned many enormities in practice. Some learned persons indeed have expressed an utter scepticism with respect to the foundation of the belief in question, considering it as entirely delusive. Some have treated the whole subject as a matter for ridicule, while others have attempted to account for such of the phenomena, as they conceived to be undeniable, upon principles which are altogether inadequate and unsatisfactory. If, however, upon a more minute and unprejudiced investigation of the powers and processes of Nature, and a more thorough examination of the physiological and psychological principles upon which they depend, it should appear that the phenomena which have occasioned so much ridicule, doubt, and discussion, may be justly ascribed partly to sympathetic sensibility to certain reciprocal influences of organic and inorganic bodies upon each other; partly to a certain disposition, or idiosyncrasy of the nervous system, and probably in some instances to a diseased state of the animal organism; would not this lead to dissipate in a great measure the clouds which have hitherto enveloped this mysterious subject, and assist us in evolving principles, which by controlling alike the rash incredulity of scepticism and the irrational errors of superstition, could not fail to conduct us to a more profound knowledge and more accurate appreciation of these apparently anomalous occurrences, and thus prove highly interesting and advantageous to the study of the philosophy of man?"

TO THE EDITOR OF THE SHEPHERD.

DEAR SHEPHERD.—Flattered by the prompt insertion of my first two effusions, I begin to form no slight opinion of myself. As I am the only purely spiritual poet of the day, of course I must be the best, just as little boys are "the best boys in the parish, when all the rest are out of it."

I now send another poem, expressive of the high mystical state, and the difficulty there is in expressing it by language. The measure is wild and irregular, but it strikes me that there is something oracular about it. In your notice to correspondents, I find you say I have too much "good sense" to do something. I beg you will not libel me thus; it is my especial boast to have no "good sense" at all.

THE ULTRA-MYSTIC,

THE MYSTICAL STATE OF BEING.

I'm in a state!
I am so great!
But somehow, Fate,
With stern dietate,
Will ne'er let me relate
What is my state.

Oh, in a region high I dwell,
But where it is no tongue can tell.
Nay, press me not, 'tis all in vain;
My glorious state I can't explain:
For subjects of such elevation
Cannot be learn'd by conversation.

I'm in a state!

I'm in a sphere!
All hear, all hear,
And very clear
It will appear.
No—I can't tell—oh dear!
What is my sphere.

I know I soar the earth above;
I heed not human hate or love.
You ask for proof! Why, proof's not wanted;
Whene'er I speak, take all for granted.
Can I explain—thou stupid elf—
My state? I KNOW IT NOT MYSELF.

I'm in a state!

SERMON, BY A BOY OF TWELVE.

WE have before us a sermon by a boy of twelve years, on the subject of regeneration! The father of this boy is a clergyman of the Church of England, and has written a preface to the sermon, in which he speaks of his son as a specimen of extraordinary talent, and remarkable piety. "Tender in conscience, and without guile, he could not sin, he would not, wilfully. Love seems the entire ruling principle of his actions, the main spring of obedience and obligingness." This is very general praise; we hope it is literally true; but we should be very sorry to praise any human being so. However, the following fact, or story, is very beautiful, and displays a fine honourable feeling, the power of an inward monitor superior to the mere influence of the opinion of others. A man who does an honourable action from the fear of reproach, or the love of approbation, is a worthy man; but he who does a similar act merely to satisfy the moral principle within, is far better. "Not long since he was standing at a bookseller's stall, conning over the volumes for sale, when the wind blowing from his hand one he was examining, it became soiled by dirt, and in his consideration unsalable. Unobserved, he replaced it with care, and went his way. He had no money in his pocket then. But a few days after, some was given him, when, without previously making any remark, he went to the shop, and telling how it was, asked for the book, saying he was come to purchase it. "Well," replied the bookseller, "there are *not many*, my boy, who would have done this." Looking for it, he said, "I cannot find the one, but never mind it." But the little fellow must have a copy, and would not leave until he had made one his own." This story tells more than a whole oration of sentimental panegyric. But what a pity it is that this little fellow should be trained up in such a hideous faith, as the creature has got, not very compatible, we think, with his "entire ruling principle" of Love. "Devils or angels will seize our departing souls," says the little preacher. "Do any suppose that God will not be as good as his word, and that he will not punish those who disobey his commands?" "Oh, no! they will then be in torments, aggravated by the remembrance of their hardness of heart," &c. If the little divine is all love himself, he has not adopted a very suitable God. We would not answer for his orthodoxy twenty years hence, unless they *install* him, and fetter him with forms, articles of faith, church livings, and hopes of preferment. In such a case he will be in great danger of serving, or trying to serve, both God and mammon,

which, according to his own high authority, seals the doom of man for ever in the lake that burneth. "If we go to Heaven, we must be born of water and of the Spirit. If not born again, we must go to Hell. * * If not regenerate, not born again, we are as sure of going to hell as we are of dying. Oh, then, flee from the wrath to come." Poor little fellow, he must be sadly frightened with his orthodox belief. He considers playing at cards and going to the theatre great sins. These are earthly things, and we must set our affections on things above, or we cannot be regenerate. We wonder what will become of the clergyman's wife, who told us the greatest happiness she expected in heaven was that of meeting her *own* children. We told her it was a most heterodox hope, that Christ was the all and in all, and she should hope for nothing but Christ. But she could not understand this. She was wrapped up in her children, and she loved them so well, that she seemed to hate all other children. She was an excellent mother, and a bad neighbour. What would the little preacher make of this woman? Would the mother go to heaven, and the neighbour to hell, or would they both go to hell together? We can easily conceive a man going to both heaven and hell—to heaven in his heavenly character, leaving the evil behind him to be destroyed in the eternal fire of God's purifying love. We certainly believe that every man goes to hell bodily, *in toto*—and to hell spiritually, *in parte*; and yet the man is saved—yet so as by fire. The philosophy of hell is very beautiful, and very delightful to think of and to hope. The vulgar hell is only for the dark ages, for a race of robbers and murderers.

UNIVERSAL TAXATION VERSUS UNIVERSAL SUFFRAGE.

THE Whigs are more willing to give universal taxation than universal suffrage. They have a great sympathy with landowners and wealthy commoners, and certainly are entitled to a shower of thanks from the rich. The Poor Law Bill was intended as a bonus to the wealthy, and they have not confined their generosity to the English gentry only, but have extended their sympathy to their fellow Diveses in Scotland. The poor rates in Scotland are levied only on the rich, and some in Glasgow pay 20*l.*, 30*l.*, and 40*l.* per annum. One gentleman told us he has sometimes paid as high as 70*l.* But such can well afford it. They are rated according to their supposed wealth, or style of life, and they can easily reduce the rate, by removing the impression of riches from the public and the assessors. But it is proposed that the rate shall now become general, and the rich be relieved from this *burden* by sharing it with the poor. An additional tax will thus be laid on the poor householders, many of whom have more need of parochial relief than ability to contribute to the support of those who, in many instances, live better than themselves. The honest pride of respectable appearance induces many industrious people to keep a good house over their heads, at the expence of many domestic comforts, at the expence even of nourishing food itself, which they willingly sacrifice to preserve their respectability. These are to be punished for this honourable and virtuous ambition, whilst those in affluent circumstances, spending in profusion, and glutting themselves with the luxuries of good living, are to be relieved of the exclusive obligation to contribute of their abundance to the support of those who are deprived of the means of subsistence. This is what is called equalizing taxation. But such legislators would be the very last to propose an equalization of suffrage. The evident tendency of this *new system* is to demoralize the people. Indeed we see little prospect at present of anything but a process of deterioration in morals. We have no faith in knowledge as a moralizing power, although it is certainly a necessary coadjutor. But the knowledge and education schemes of moral improvement are mere puffs and quack nostrums, and their adoption will prove equally falacious with the universal pills of the drug-mongers, unless they be accompanied with outward means of appeasing the irritated feelings, and leaving the mind at ease to look to its own improvement. Before you can make men good, you must cease to make them evil. If you make

them evil by privations, your education schemes will only supply them with ammunition and instruments to redress their own grievances by increasing the confusion of society.

MENTAL RESOURCE.

AMONG the names in our obituary, is that of Mr. John Miller, teacher, Cotton-street. A more surprising example of self-dependence and self-support, under physical malformation, is rarely to be met with. Mr. Miller was only about three feet in height, his knee joints did not play, and the motion of his legs was produced at the hip joints alone. Instead of arms, he had merely two stumps, one of them a few inches long, the other rather longer, but less than half the length of an ordinary arm. His longest stump terminated in something having a distant resemblance to a finger and thumb, which enabled him to hold a pen. When he first learned to write, he did so with his foot, with which also he performed many other useful actions. On becoming a teacher, which he did twenty years ago, he wrote with the stump alluded to. In ruling his copy books, he held the pencil in his teeth, and moved the roller with his stump with considerable accuracy and expedition. When young, application was made by a showman to get him for an object of exhibition, but he spurned at this, armed himself with a poker, and dared the showman to touch him. On one occasion, a female, with a similar malformation to his own, was exhibited in town. He expressed a wish to see her, and was taken to the spot for that purpose, but on seeing her picture on the canvass without, he could not be prevailed on to go farther. He paid great attention to teaching, and at one time had about 120 scholars. Latterly, however, he had only 30 or 40, and as they were chiefly of the poorer classes his income was very scanty. He was of a good disposition, and most independent in his feelings. He could not brook the idea of parochial support, but, by means of his school, he supported his mother until her death a few years ago, and himself since. The falling off of his school, the fear, and the feelings, too, of poverty, probably hastened his death. He took ill on Saturday, and died on the Monday following.—*Paisley Advertiser*.

THE NEW MODE OF HEATING ROOMS, &c.

THE puzzle which has been shewn at the Jerusalem Coffee-house, has set the wits of conjecturers at work upon the nature of the particular fuel which, at so cheap a cost as a farthing an hour, is to warm a room. Of these conjectures we have heard two. The first is, that the gardener who discovered the fuel which enabled him to keep up the fire whilst he slept, must have used old tanners' bark, as it was the only fuel accessible in a hot-house. The other is, that charcoal is the base, and lime employed to absorb the carbonic acid gas. Gipsies are in the practice of using the ashes of their fires, raked together in a heap, and sprinkled with lime. This will burn throughout the night, and give out much heat, and no deteriorating gas is evolved to distress the sleepers in the gipsy tent. We shall soon know the secret.—*Literary Gazette*.

We are informed, that it is by a common herb, or root, that the fire is fed; and that it will become universal as soon as the discoverer has secured his own remuneration. Our coal beds will then last for a few thousand years longer than our philosophers have calculated. It is supposed that this new fuel will introduce a very important change into domestic life. If it should prove the means of purifying the atmosphere of large cities, it will be a valuable boon conferred upon society, and the fortunate gardener will become a sort of second Adam to our friends the materialists, whose zealous endeavours to remove smoke, mystery, and corruption from the atmosphere, are deserving of everlasting remembrance.

ERRATA.

P. 239, col. 1, line 3, for "imperceived," read "are perceived," line 14, for "by will," "very well."

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 32, Vol. III.]

SATURDAY, FEBRUARY 3, 1838.

[PRICE 1½d.]

INDIVIDUALISM.—EXTERNAL AND INTERNAL CIRCUMSTANCES.

But from his own brave stock, out at his side
A twig sprung up, which grew as fair as he;
As high it rais'd its head, its arms as wide,
And flourished with equal gallantry.

Their leaves all kiss'd, their arms embraced each other;
They lived, and loved, and joyed, and reigned together.—
Beaumont's Psyche.

EXTERNAL circumstances act upon the individual, and help to form his character. Internal circumstances arise in the individual, and are also instrumental in giving a direction to his principles of action.

Every man's own imagination makes a world within him, and that imaginary world influences his thoughts, words, and actions, as positively and directly as the outward world itself. Almost every thinking man has a *beau ideal* world within his own mind—a world very different from the world without, though subject to the same universal laws of Nature to which the imagination, as the offspring of Nature, is obliged to adhere. It is very difficult for us to determine how that inward world is produced. Some maintain, that it is merely a renovation of past sensations from without; others, again, maintain that it is a new creation from within. Probably both ideas are correct; it is partly both—but no one can dispute the reality of the inward world of imagination.

The highest order of minds have this imaginary world most strongly outlined and coloured. They are, therefore, most powerfully acted upon from within, and in this sense of the word are most individualized. They have the greatest originality of mind. They are creators of a secondary rank, and their natural tendency is to approximate the outward world to their own ideal creation. It is one of Mr. Owen's favourite ideas, that the outward world may be *beau-idealized*, that is, advanced to such a high degree of perfection, that the imagination itself would find nothing beyond it with which to amuse itself. These imaginary creations would, therefore, be checked, and the teeming fancy obliged to seek a new field in which to disport itself. He considers that the imagination may be trained from infancy, like any other faculty, and certain ideas, religious ideas, for instance, be thoroughly subdued by a mere omission of religious training in early life. Most probably, in coming to this opinion, he reasons upon the supposition, that the imagination is not a creative faculty, but a faculty which revives and combines past sensations.

Our own opinion is, that the imagination is essentially creative, but limited, of course, by the laws of our common nature. Imagination defies the schoolmaster. It despises the forms and regulations of society. It is one of the most peculiar properties of this faculty to step out of the hackneyed course of art, and seek out a field of being on which human artifice has not imprinted its footsteps. It will always outstrip and excel reality. It is the *avant courier* of action. It creates within, long before the hands are enabled to erect without; and with

this inward creation, it forms an element of disaffection, which becomes the source of all external reformation. To suppose a period when this world within will cease to surpass the world without, is supposing a condition of humanity in which progress is at an end, and humanity is tantamount to deity. This is absurd. Man, therefore, will for ever be the creator of an imaginary world within his own mind, which imaginary world will have an influence on his movements, in combination with the real social world in which he exists.

Moreover, no system of education is able to remove the religious feeling; on the contrary, any positive attempt to subdue it would give it a corresponding stimulus, and infuse new life into it. The chief source of infidelity and irreligion is neither immorality, nor ignorance, nor science, but it is the abuse of religion itself, the excessive corruption into which its professors have been led, either by a mistaken zeal, or by an intemperate and perverse spirit of tyranny and intolerance. This rouses the contradictory spirit, and begets an opposing party, which goes as far to the north as the former to the south. Thus the equilibrium of Nature is preserved. Nor has education much to do with the creation of a real religious feeling. The elementary, or imaginative Nature is the principal agent, working, however, either with, for, or against, what education has done. Conversions in mature life are very numerous, both into and out of the Church, and these conversions arise, sometimes from intercourse with others, sometimes from creations within. Opposition has a natural tendency to beget its opponent. Infidels frequently beget religious children. A zealous advocacy of infidelity in a parent to a child is very likely to produce a religious feeling in mature life. The zeal consumes itself. As the boy mixes with the world, and associates with new minds, he discovers, upon reflection, that his father was strongly prejudiced. His eyes open, his liberality kindles; his heart warms towards those whom he was taught to abhor, and he rushes into their society, like air into a vacuum. We have known several instances of this. Religious education produces a similar effect; and it is a very common observation amongst country people, that clergymen's sons, *not* educated for the Church, are either infidels or reprobates. We have many illustrations of this in our mind at present. The most reckless and desperate moralists and freethinkers we knew at college were clergymen's sons. The process by which they became so is exceedingly simple and intelligible, and we see its type in the physical world all around. It corresponds to what the electrician calls induction. If you electrify a substance positively, the atmosphere around it becomes negatively electrified by induction; that is, the surcharge of one species of electricity draws, by consequence, the other to its vicinity, in a ratio corresponding to its own amount.

Apply this simple law of Nature to a forcing system, a forming system, which *endeavours* to subdue feelings existing in Nature, and necessarily belonging to every imaginative mind, and the result you perceive is just the opposite of your intentions. This must arise from an inward reaction. You have loaded the ass too heavily; it kicks, and throws off the burden; or you have sickened the universal fancy with a one-sided view, and placed a forbidden fruit tree in your garden of edu-

cation, and the consequence is, that your pupils are urged by curiosity to run to the forbidden fruit. If Materialism were the established religion, all the freethinkers would become spiritualists, and infidelity would be moving heaven, earth, and hell, to prove the independent existence of the soul, and its everlasting life. Materialism is merely ballast to keep the vessel erect.

All this proves, if proof were required, the principle of reaction, which defies the action from without, by going counter to it. External circumstances, therefore, are so far inefficient, that they have a tendency to act by contraries, and to produce the opposite of what the projector intended. And as the Church, which was originally established for good, and is still defended for that special purpose by many worthy men, is actually, by the law of contrariety, begetting a school of infidelity in the land; so also would any outward system, organised on purpose to subdue, or suppress the flight of human imagination, give new impulse and vigour to the creative faculty, and cause it to soar to higher regions than a state of liberty would have given it zeal to ascend. The imagination must be let alone, and being let alone, it will go on with the creation which it has begun, and upon which it has been exercising its inventive skill, from the first dawns of the Divine Logos in the soul of man.

Now this imagination is the soul of individualism, the centre of mysticism. Every man possesses it, but some yield more to its influence than others. Some have very little of the resisting power in relation to externals, and thus give way to external impulse. Others have very little resisting power in relation to internals, and thus give way to internal impulse. These are two different species of men, both very useful in their place, if they were only reconciled to each other; but they have each an unconquerable desire to unsex their opposites, and make all the species like themselves. The latter are spiritualists, and when they carry their peculiarities to excess, they become mystics, and endeavour to bury the external world entirely, before they themselves are buried.

The principle of mysticism therefore we recognize. It remains only for us to determine, how far it ought to be carried. This of course each will determine for himself. But at present the most charitable conclusion to which we can come is, that as long as it admits a foundation of truth in the opposite opinion, it is tolerable and reasonable; for a man has a right to lean as much as he pleases to one side of his nature, provided he preserves the other in being, and acknowledges its influence as an elementary principle of action. We say the same of materialism; it also is reasonable and tolerable as long as it acknowledges the influence and being of the opposite polar principle of our Nature, the spiritual. A denial of the spiritual power and being makes materialism irrational, and *vice versa*, mysticism becomes irrational when it argues for the nonentity of the material as a former of character. Yet, as wit and madness are only separated from each other by a thin partition, so these two extremes, however unreasonable, are very near the universal truth. They are both so far liberal, that they do not doom men to perdition for modes of opinion; but they are not universal, in so far as they reciprocally strive to destroy the elementary principle of the other's faith. In so far as they do not doom each other to perdition, they can meet upon very friendly terms. There is nothing very inquisitorial in the one to provoke the other. They have therefore a tolerably large portion of the spirit of conciliation in a moral sense, but intellectually, in controversy, they are perfect antipodes.

The spiritualist, or mystic, is the most independent of the two parties. He makes his own world. He lives in his own creation. With proper self-control, he governs it as he pleases; a republic to-day, and a monarchy to-morrow; he enjoys as many revolutions and crises as he desires, with very little trouble to himself, and very little disturbance from the pressure from without. In this respect, we admire the mystic. A genuine mystic is a happy man; but he is an individualist, politically and socially, and externally; for he meddles not with, and dabbles not in, the fickle and vanishing affairs of terrestrial men. His wants are few, his cares are few, and he is a rich man, because he wants but little, which he cannot create. Like Midas,

he makes his own gold, and every thing he touches in his own self-centred universe, starts up into being like a spirit at the voice of a conjuror, arrayed in all the glory which he desires to contemplate. He is a poet; he feeds on the soul of Nature; he burns the gas, and throws away the char. He is a priest; he holds communion with the wonder-worker, and rejoices in the service of the inner tabernacle, the holiest of all; into which none but the high priest can enter.

But there is a sense in which the mystic is a universalist in the highest sense of the word. He universalizes the creative power of Deity, and by imagining himself as united with God, he looks over creation with an all-comprehending eye, as from the central throne of being, and recognizes the unity of that all-pervading power, which measures eternity and spans infinity, and which descends to the infinitely little with as much ease and majesty, as it grasps and regulates the infinitely great. What can be more universal than this? This is the picture of the centre-seated mystic, married to his god. Happy is he who can thus sit down at the right hand of his only Father, and repose himself in confidence on the chief good.

But this picture of the mystic makes him unsocial in respect to his fellow men. There is something a wanting. He has gone alone to heaven. He has presumed to consider himself as a man. Now he is not a man. He is merely a member of the man. This is our argument against the mystic arguing in his own fashion, for that is the mode which we prefer with all men. The species is man, the Son of God. They are redeemed together, bodily and spiritually; and all individual improvement is partial, until the universal action bring forth its final result. Adam was a man before Eve was formed, because he had *all* human Nature in him; but as soon as Eve was created, he was no more a man, for he had only a portion of humanity. There were human feelings then in being of which he was not a partaker. Upon this principle, we condemn the system of seclusion. It is a partitive system, which breaks up the universal man, and leads away in direct opposition from the desirable termination of all progress, social communion. The mystic, we know, will reply to this, that by seeking God inwardly, we all find the same thing, and thus all meet in the same fold. This sounds very plausible in words, and many are deceived by the simplicity with which it comes out. But experience teaches a different lesson; and a little analogical reasoning, which is the best for universal subjects, will teach us, that what each man esteems to be God, is the individual Deity of his own fractional mind; and he himself being but a fraction of humanity, can only perceive a fractional Deity. Thus God is a different being in different minds. Each has its own ray of light; one lives in red, another in blue, another in yellow; and the one sees a red God, the other a blue God, and the third a yellow God. By social amalgamation, the three colours are united, and white is produced; but without this social amalgamation, the anchorite's God is, and for ever remains, a painted divinity; an idolatrous image, a self creation, which must deceive, and justly deceives, in order that the species be driven forward to social union, which is the perfection of our being. There is a wisdom and a mercy tempered with justice in this, which calls loud for admiration. Were each individual independent of another, did his happiness consist in that independence, or were it even susceptible of development to a high degree in that individualized state, the strong link of brotherhood that binds man to man, would cease to have a being. Were each individual inwardly the same as another, did he see God exactly as his brother sees him, and feel as his brother feels, and think as his brother thinks, where would be that beautiful variety in minds which constitutes one of the charms of life, and the never ending source of intellectual entertainment and moral enjoyment? To produce this dependence and variety, our inward eyes are differently coloured, and endowed with different magnifying and multiplying powers. These varieties of organic structure will for ever produce corresponding variety in intellectual and moral being, but there is a social process, by which that variety may all be harmonized, and made to play sweet music in the chorus of life.

This process cannot be effected without a form or mode of social existence. We do not say that the form alone is necessary. We only assert that it is indispensable; a form in con-

sonance with the effect to be produced. This brings us to the materialist and his universalism, which is a universalism of outward things, and a perfect individualism with regard to Deity, inasmuch as the materialist perceives, no directing power higher than himself; all creation is a mess, and his own creator a puff of wind, or a volume of gas. Nothing can be less universal than this, for it breaks up the unity of Nature entirely, by removing the omnipresent will. Atonement, however, is made for this glaring defect by the outward universalism which the materialist insists upon, and which the mystic considers unnecessary. Where the one is universal, the other is individual, and *vice versa*. They form a curious contrast. We are most piously and devoutly of opinion, that a union of the two doctrines is as near an approximation to perfection, as can well be made in this sublunary system.

But we have not done with individualism; next week we mean to inquire whether it is not necessary, to a considerable extent, to preserve it in social life. There are some important arguments in favour of it which must be considered. Every man is necessarily a distinct being, an individual. How far is it necessary or prudent for society to recognize his independence? It cannot be wholly destroyed, and yet there must be a limit to it.

THE GLASGOW COTTON SPINNERS.

THE trial of the Glasgow cotton spinners, and the secret conspiracies it has brought to light, are subjects of intense interest at present to the working classes. The foolish combinations to raise wages, to monopolize labour, and to accomplish these ends by violent means, were never more clearly exposed to the condemnation of the industrious and the sober workman, than by the late disclosures. That the working classes have real grievances to complain of we admit and positively insist upon, but that such grievances are to be removed by private conspiracies, we positively deny. What are nine hundred or one thousand men to the nation? Is their interest to be identified with that of the British public? What right have they to control the liberty of their fellow men, to dictate to them what employment they must follow, and to shut the door of any species of manufacturing labour against them? Were such combinations to succeed, we should merely have a democracy of jailors and turnkeys, and a new system of Indian castes, which would prevent a man from following the profession to which his genius or his interest inclined him. All such attempts at coercion, are not only illegal according to the statutes, but according to the moral law of Nature. The people can only act legally in a collective capacity. A fraction of the people has no right to legislate. It is upon this principle that the people insist upon universal suffrage. Yet, in the teeth of their own principles, they establish a system of tyranny over their fellow men, which is really more cruel than that of aristocracy, or monarchy, or any other species of controlling power that has ever been sanctioned by civilized nations. The people have lost many friends by these disclosures; we are sorry for them, but the lesson will be useful if it direct their minds to the cultivation of that pure, moral, and religious feeling, without which, their influence must always be brutal, their conspiracies bloody and violent, and their leaders furious desperadoes, whose life is a whirlwind of passion, and their doom is perdition, with little sympathy from the public at large. This is not another *Dorchester* affair. The men of *Dorchester* were innocent, injured men. The cotton spinners of Glasgow are not, unless the trial, which seems to be fair, has fearfully belied them. This we scarcely think possible.

The following speech of Sheriff Alison, of Glasgow, at the close of the Glasgow Circuit Court of Justiciary, is so much to the purpose, that we give it with pleasure, entire. After the concluding address of Lord Medwyn to the sheriffs and magistrates,

Mr. Sheriff Alison then rose and said—Unusual as it is, my Lords, for the Sheriffs to make any reply to your Lordships, after the observations which you have addressed to them on the close of the Assizes, I trust you will forgive me if on this occasion I trespass for a few moments on your indulgence. I feel

too strongly to attempt to disguise the great satisfaction which, in common with all the official gentlemen connected with me in the investigation of the cotton-spinners conspiracy, I have derived from the approbation which you have been pleased to express at our exertions, and the gratitude with which I am penetrated for the highly complimentary, I fear too partial expressions which you have used towards myself. My Lords, it would be vain to conceal that, in the course of the arduous duty which officially fell upon us, of tracing out the ramifications of this momentous conspiracy, and discovering and protecting the witnesses by whom it was to be established, I have often almost despaired of success—not from a doubt as to the reality of the crimes charged against the conspirators—not from a doubt of the share which the accused had in their perpetration—but from the extraordinary power and indefatigable efforts of a numerous association, consisting in this neighbourhood of several thousand persons, combined with hundreds of thousands through the whole empire, by whose activity and intimidation, the arm of justice in this country has for the last twenty years, in relation to crimes of this description, been so often paralysed. I rejoice that its misdeeds are at length completely brought to light, and, despite all the efforts of intimidation, and all the attempts at concealment, the acts of assassination and fire raising by which terror has so long been spread through the West of Scotland, have been traced to their real source, and the system by which they were perpetrated, fully developed. Now that this has been done, the real object of the prosecution has been attained, which was rather to influence the moral feelings of mankind by the display of the atrocities by which the conspiracy has been stained, and to which it so readily leads, than to terrify them by the punishment which might be inflicted; and, however deep may be the guilt of the convicted prisoners, no one rejoices more sincerely than myself, that it has been found possible by the Court, in awarding sentence, to temper justice with mercy. I trust to the memorable trial which has just concluded at Edinburgh, to induce the working classes of this great city to pause on the threshold of a career which they see leads by so easy a transition to such frightful crimes; but I trust still more to the eloquent and emphatic words which your Lordships have addressed to the conspirators tried at this Circuit, and through them to the whole working millions of the empire, and which, speaking to the understanding through the heart, must win their way now into the most unwilling breasts by the simplicity and justice of the sentiments which they convey. My Lords, opposed as we were in the whole progress of this investigation, by the constant efforts of a section of the people who almost made a public question of the case, we must have proved unsuccessful in our efforts to bring the guilty to justice, if we had not been directed and seconded by the firmness, talent and zeal of the Queen's Counsel, to whom I feel myself bound to make this public acknowledgment, and to whose abilities and exertions I mainly ascribe the successful issue of the trial. It may seem superfluous, after what your Lordship has said, for me to notice the aid by which I have been supported in this place, but I cannot pass over in silence the indefatigable perseverance, unflinching resolution, and unwearied zeal of my friend Mr. Salmond, or the cool determination and skilful efforts of his able assistant Mr. Nish, by whom the threads of this conspiracy have been so clearly traced. I have equal pleasure in bearing this public testimony to the integrity and admirable professional skill with which I was assisted by Captain Miller, the head of the Glasgow Police, in the most critical moment of our public duty. It is no small satisfaction to me to reflect that this great contest of justice with violence has been conducted from first to last without one soldier being called upon to act, or one drop of blood being shed in defence of the majesty of the law; and that so admirable were the arrangements of the Police, that the conspirators were detected and arrested, and all their papers seized, without one blow being struck, or one voice elevated in the contest. My Lords, when I recollect Captain Miller's conduct, when he entered the Committee-room of the conspirators, and reflect on the moment when I stood beside him in the middle of the apartment, as he beckoned them out, one by one, till the whole fifteen were delivered over to the Police on the

outside, with as calm a manner and resolute a voice as if he were now discharging his ordinary duty in this Court: and when I call to mind the character and proved deeds of the conspiracy, and recollect that every room in the house was then also crowded with conspirators, and that hundreds of the association thronged the streets, almost within call, I cannot but regard his conduct on the occasion as one of the most remarkable instances on record of that moral resolution which is above the shield of innocence and the bride of crime, and which, paralysing guilt, by the ascendancy of courage, proves its own safeguard by the awe which it inspires. The strike, from which emanated this frightful series of crimes, which has so long engaged the attention of the Court at Edinburgh, has since come to a close; but the disastrous effects which it has produced will not so easily be repaired, and they have fixed a dark and ineffaceable stain upon the moral character of the people of this country. My Lords, the ruinous consequences of the strike upon the industry and prosperity of the manufacturing classes is already frightfully apparent. The return of the commitments for the county of Lanark, which I have just completed for the Home Office, exhibits a melancholy increase of crime during the last year, and which will forcibly attract the attention of the legislature. At the Christmas jail delivery last year, only seven prisoners remained in custody for trial in this city; by the schedule which I hold in my hand, there are at this moment sixty-eight, almost all committed during the last two months! Nor is this result surprising. During the disastrous strikes of the last summer, twenty or thirty thousand young persons of both sexes were thrown idle for many months in this city and its immediate neighbourhood, almost all accustomed to high wages, and too often to habitual intemperance. Nine-and-twenty thousand persons in Glasgow are, directly or indirectly, employed in the manufacture of cotton goods, the great majority of whom were thrown idle by the spinners' strike; and this calamitous event took place at a period of unexampled distress from the general commercial embarrassments of the country, and hardly any means of absorbing the helpless multitudes in other trades existed. For the skilled workmen who arranged their strikes, the cotton-spinners, iron-moulders, colliers, or sawyers' funds were provided from the resources of the Association to which they severally belonged; but for the unhappy persons whom they employed in their labour, the piecers, pickers, drawers, &c., no provision whatever existed, and they were thrown in vast and appalling numbers far beyond the reach either of public or private charity on the streets, or into public-houses, to lull away the weary hours of compulsory idleness. The results may easily be anticipated. The wretched victims of this tyranny all got deeply into debt, if they had any credit, and if they had none, sunk into such habits of idleness, profligacy, and intemperance, that great numbers of them have been permanently rendered mere nuisances and burdens to society. The cotton-spinners' strike alone threw six or seven thousand women and children out of employment for a long period; eight thousand human beings were retained in a state of destitution and wretchedness for four months merely at the pleasure of fifteen men! Numbers of the persons thus directly or indirectly reduced to idleness have already been tried for various offences at this Circuit; still more await their trial at the next. Often they openly ascribe in their declarations the origin of their crimes to the idleness, drunkenness, and suffering, consequent on the strikes of the trade to which they belonged, or on which they depend. And what must be the confusion of moral idea, the utter abandonment of religious principle, which could lead eight or nine hundred men to acquiesce in, and, likewise, impatiently to expect, the fruits of a known and organised system of conflagration and violence! Nor have the effects of this unhappy and unnatural system upon society been less disastrous. The cotton-spinners' strike cost the persons who were employed in that trade, spinners, piecers, and others, above £50,000!—the loss to the masters was as great—that to the persons whom they employed or dealt with for provisions or other articles, probably still greater. Two hundred thousand pounds were lost to Glasgow and its vicinity in four months, without a shilling being gained by any human being, by the strike of this trade alone. The total loss sustained by La-

narkshire, between the strikes of the colliers, the iron-moulders, sawyers, and spinners, last year, was, at least, £500,000. Society cannot long go on under a repetition of such shocks—capital will migrate from the country where it is subject to such calamities. And, what is most remarkable, these grievous blows were inflicted by the working classes on themselves at the very time when commercial credit was reeling under the effects of the convulsion of last year, and the most respectable establishments with difficulty sustained themselves against the accumulated pressure of diminished orders and increased embarrassments. The principle of the operatives has too often been, by combination and violence, to force up their wages during prosperity, and, by combination and violence, to prevent them from falling in adversity—hoping thus to avert from themselves the law of nature, and build up on the foundation of intimidation a durable prosperity amidst the fleeting changes of human affairs. And what has been the consequence? Why, that in the insane attempt, they have tripled the distress already sufficiently severe which the late commercial crisis has brought upon them, and chilled the warmth even of Christian charity, by the evident and ruinous addition which their own conduct has made to their sufferings. It is known to my respected friend, Mr. Campbell, in the magistracy of this city, whose labours have done so much to distribute to the really deserving the great funds raised last winter for the relief of the poor, that for one person who was thrown out of employment by the late commercial crisis, two were reduced to destitution by the voluntary strikes of the workmen during its continuance—proving thus that even a monetary crash which convulsed the globe, has done less to augment human suffering than that moral earthquake which has spread a pestilential darkness over the manufacturing community, which has rent asunder the bonds by which society is held together, opened a yawning gulf between those classes whose united efforts are required for general prosperity, and armed in deadly hostility even one set of workmen against another. Do the operatives really believe that their interests are in the end at variance with those of their masters, and that they will be permanently benefitted by forcing up their wages by murder and fire raising to an unnatural level? The interests of the master and workman are ever the same, and can never be disjoined—it ever must be the interest of the employer to allure and retain in his service the skilled and experienced servant. Nothing but necessity will ever drive him to new hands. The workmen say they have hitherto kept their wages up by means of combination and violence; and that they would not now be earning 30s. or 40s. a week but for such assistance. Even if this were the case, do they not see that such methods must in the end defeat their own object, and that the only effect which can result from such forced elevation of the price of labour is, that it will cease to find a market for its produce. Already that effect has become conspicuous. Numbers of the cotton manufacturers in this city have constructed mills which dispense with spinners altogether,—others have succeeded, by machinery, in reducing the numbers required to one-half. By the boasted rise of their wages, by the harassing repetition of their strikes, the cotton spinners have dug the grave of their own industry. If they soon find themselves thrown out of employment altogether, and machinery supplanting entirely the industry on which they depend, they have none to blame for it but themselves. And if this effect does not take place, what other result do they anticipate? Do they expect by combination and violence permanently to secure both higher wages for their labour than circumstances will admit, and also a durable vent for their produce? Will not the market for our industry be lost if such an effect continues? Will not Prussia, and Russia, and France, receive it with open arms, and readily give it that protection which it has ceased to find in the British isles? And will not this city be reduced to ruins, and the land of Watt and Arkwright be stript of its fabrics, and despotism, in the end, reap those fruits which the arms of freedom have sown? Around us—on all sides—the woeful effects of these strikes upon the interests of industry are spreading. They tell us, in a voice of thunder, that the worst enemy of the poor is the combined conspirator. Fever and pestilence are walk-

ing in the rear of combination—they find a copious havoc of death in the weakened victims of compulsory idleness. Above three thousand four hundred cases of fever were treated last year in the Royal Infirmary of Glasgow alone. The total cases of that disease were above eight thousand. These numbers, appalling as they are, this year are on the increase. The average mortality of this city, which, fifteen years ago, was one in forty, and four years ago one in twenty-nine, was last year so low as one in twenty-five, a rate of mortality, it is believed, unparalleled in any other European city. All this has taken place during a period, till last year, of unexampled prosperity, when all willing to work had ample employment. I am not surprised at these calamitous results—they have advanced side by side with combined conspiracy. I see in them the effect of the arm of Omnipotence chastising the folly or wickedness of man—the necessary consequence of his own infatuation. Impressed with these ideas, I feel that in striving to bring to light the details of this conspiracy, I have been really the poor man's friend—I have not been maintaining the interests of wealth against poverty—of tyranny against freedom—of capital against industry—I have been supporting the cause of industry against idleness—of innocence against violence—of liberty against oppression. Gratefully acknowledging your Lordship's too flattering encomium, I can arrogate to myself no merit in what I have done—I have merely discharged my duty as all my brethren in the same situation would have done; but I have the satisfaction of thinking it will not be without its reward, if it shall be instrumental in opening the eyes of the working classes of this great community to their real interests, and restoring that harmony between them and their employers which infatuation can only seek to break, and the rupture of which mutual suffering must ever accompany.

[As much may be said in favour of the cotton-spinners, we shall reserve it for next week; we are very unwilling to condemn *in toto*. It is the mode or manner, more than the end contemplated, we condemn, and better as well as legal modes are possible for obtaining even a better object.]

THE OMNIVOROUS ANIMAL.

ONE reason for the prevalence of flesh-eating, by nations and people otherwise civilized, is its costliness. This may seem to be an extraordinary contradiction among people whose civilization and poverty keep pace together, but theory and practice are easily perceived to be coincident. The rich, who in all cases become so by violation of the laws of justice, require an external stimulation to keep conscience at peace by smothering it; and they afterwards adopt such stimulants from the desire of enjoyment and luxury. The first departure from the *in-stimulant*, creates the first necessity for an *ex-stimulant*. The necessity for every additional dose grows from the first, like additional drink for the drunkard, or supplementary lies from the liar.

Costly stimulants being attainable in profusion by the rich only, are objects of constant desire with their wretched imitators, the middling classes and the poor. Indulgence therein, as often as the pecuniary means come to hand, necessarily leaves the poor man as poor at the year's end as he was at the beginning. Were the income of such to be doubled, they would evidently be no better off in any valuable respect. More animal indulgence would be enjoyed, as was the case half a century ago, when the mass of London mechanics spent several days a-week in the public house. But such a change in their external condition would neither bring them nearer to heavenly nor to earthly bliss.

This conclusion is arrived at from the following, among other reasons:—

Human beings, and their dispositions, are only really tested according to the measure of freedom which they have. If you want to know the school-boy's character, scrutinize him, not in, but out of school. Look at the mass of people about us, when in the few moments they have a taste of liberty, they display the real tendencies and wishes of their hearts. Eating and drinking, for the purpose of "enjoying themselves," as they call it, are foremost attractions. I mean not to libel the

sober-minded working men, who, I believe, are, after many severe lessons of poverty, at length learning to think a little; but, looking at the use made of Sundays and holidays, in and about London, devoted as they are, either to priestly influence, to frivolity, or to debauchery, by a large majority of the population, is not the conviction forced on us, that we are not yet prepared for those better forms of society which the moralist demands? If liberated but one day in seven, or but one day in seventy, the determination to be *really* free ought to be so prevalent as to show itself on the smallest occasion. But here is a road to freedom which each individual may travel in his own manner. A travelling which qualifies him for more freedom in himself, and to give room for more freedom to others. If men will not voluntarily adopt so easy a means for their own emancipation, nor for that of their fellow men, it is not likely they will go the greater length of self-denial which is the condition of a better state of existence. Nor have they any qualified right to demand of the politically powerful any sacrifice on their part for the purpose of elevating the mass.

From these and other obvious considerations, it is to be concluded, that the abstinence of necessity is good for nothing. Not only that absolute kind of poverty which does not indulge because it cannot obtain; but abstinence on the ground of economy is likewise rather to be deprecated than encouraged. The new Poor Law diet system will assuredly not promote popular education to this end; neither is a miserable miserly saving to be made the basis of social melioration. Moral grounds are the meanest upon which can be built an attempt to better the rational and physical natures of man. The working population, and our modern philosophers, too, have apparently yet to learn, that there is a sphere of existence deeper than thought. Whether sensualist or spiritualist, each goes on in his own will, imbibing his own liking, "cos 'em so delightful," as Buckstone says; not perceiving, perhaps, that the "cos I like it" philosophy is that on which man has acted from the days of Adam until now; and on which, so long as he continues to act, he must continue to deplore the consequences. Beef-steak and whisky suppers naturally give night-mares, and morning head-aches. Then, as physical pain disqualifies from doing our neighbourly duty, we do not put it down to the account of selfishness.

Few persons can adopt what they think a sounder opinion, or a superior practice, without being seized with a feverish zeal for the propagation of such opinion or practice in all persons around them. In season, and out of season, they constantly hammer at their family and friends, in order to press them within the same circle. This petty egotism is the origin of a large persecution.

Should an abstainer think it desirable to induce such an effect in another, let a superior example of the results be manifested in preference to argument. Furthermore, the freedom which should exist among mankind in much more important matters, we must allow that this is a secondary question, so far, at least, that if any one can carry out the highest conceivable end of man's being placed on the earth, while, at the same time, he is an habitual consumer of his fellow-creature's flesh, he may show us how. Besides, the man who abstains in the midst of an abundance, which he daily and hourly resists, has so many the more opportunities of exhibiting a strength of principle without obtrusiveness, and firmness of character without tyranny, which the more absolute head of a family can never display.

I say, if any one can live such a life, while following such courses, let him. There are, possibly, individuals of such mental and divine strength, but I have not the happiness of their acquaintance, neither am I one. Though such an individual might defy contamination of the higher, by the lower nature, I cannot. And I believe I am, in that respect, like other ordinary mortals. If I were to be guilty of drinking fermented liquors, when once they had, by my will, passed into my case, they would be beyond my control, and intoxication, which is madness, or temporary moral death, must ensue. If I were to be guilty of eating flesh, the similar effects of its fermentation on the nerves, though in a duller mode, yet with deeper deadly effects, would be equally certain and irresistible.

It is a common answer to drunkards, who plead in excuse that a very little overcomes them, that they have no right even to smell at the bottle if it produces such effects as the temporary loss of their reasoning powers. I would put a parallel observation to every flesh eater, that "you have no right so much as to the smell of flesh, if for one moment it leads you astray, or downwards from the grand design of your existence." You know not, you imagine not, what that may be, while you surround yourself with such deteriorating conditions. You never can know, while you continue to suspend the sense of internal perception, by a custom as certain in producing such a result, as drunkenness is in producing a suspension of the reasoning faculties. As a man constantly flying to the bottle as he begins to grow sober, must be classed with the insane; so the individuals constantly flying to flesh as they grow hungry, form a class of a deeper insanity, or moral insanity. Gin drinking in act may not be a crime, but its consequences are most wretched, as its cause is base. Flesh eating may not be an actual sin (*i. e.*, separation), but it is a most seductive condition of moral greediness, and mystic death.

The *Shepherd* is deeply interested in this question, if my calculations are good for anything. For it seems to me that no one can become an abstainer on the ground of general improvement, be the idea ever so vague, without approximating to universality in his views, and in his life. He will view everything in the natural, social, and spiritual worlds, in a new, and brighter, and more harmonious manner. He will detest those selfish reservations which commerce and money-loving put on the mind; he will be really more brotherly, though in the present state of things he seem more separated. A putting away of the lower worldly troubles, and a full command of the external passions, may not be immediately attainable by one who for years has been going on in a whirl of successful money-making, or of wit-uttering; but the internal check is nearer to him, and, luckily for his neighbours, hits him harder knocks. I wish to entice no one unduly. The reformed drunkard, as a drunkard, loses all his happiness, and must have a supply of a new sort, from a new source. The rational flesh-eater, turning abstainer, will, in like manner, lose all his happiness thence derived, and must get a supply of a new sort from a new source.

On the question of health I have forbore to enter, though much may be said, because I would put reform on no selfish grounds. The poet says of sheep-slaying—

"That well revenge may rest contented,
Since drums and parchment were invented."

But war and law have not had half so many victims, as good fatted mutton has laid on the altar of medicine.

A MYSTIC STUDENT.

P.S.—As well as the poet's rifle, the metaphysician's great gun, can, it appears, be brought to bear upon this question. The Transcendentalist can, if necessary for the belly's vindication, come to the assistance of the "Head-Eater" of the *Shepherd* in order to prove that intellect and blood-sucking can exist together. Our friendly enlightener may save himself so much trouble. It is granted him. We will stroll through the Radcliffe, or the Museum Library, and pointing to each author's works, from Socrates, from Moses if he likes, down to Dr. Johnson, or Byron, with few exceptions, all shall be classed with the Omnivorous Animals. The same shall be granted for the sculptors, the painters, and the rest. What then? Have these men, or their works, yet redeemed mankind from their misery, and their miserable pursuits and hopes? Are they ever likely to do so? No. Preaching, writing, printing, painting, and every other invention, has been wholly free to the service of the Mentalist, and the advocate of intellect-derived morals. Yet such men never have given room for the expansion of one iota more being than was previously developed in man. They never designed to do so. They thought of it, but it was too mystical. So they have proceeded to refine more and more the natures they found ready to their hands. They have helped to shift human misery from body to mind, and have necessarily made it more painful as they made it less rough.

The benevolent and enlightened schoolmaster no longer flogs the boy's flesh, he has discovered that this is not "correction," but he torments and lacerates his mind. The grossness of the rod is displaced by the sensitiveness of a principle tenfold more cruel, administered under the mild term "emulation."

The Intellectualist can show that ideas born of animal food, and fermented liquors, are calculated to enhance morality! He can demonstrate that a pot of ale and an idiot birth have no connection; yet he maintains there is no effect without a cause. But on this subject I propose to trouble you with a separate and concluding letter. I perceive it will require some care, lest, on the one hand, the shafts of ridicule turn the readers consideration aside; or, on the other, lest the *Shepherd* deem it to be lifting the veil too much. At the same time, its greater importance demands that we should not flinch from the greater difficulty.

[Ridicule and rebuke are both very useful at times in throwing a man back on himself, and causing him to review his own works. They are a species of mental, or spiritual adversity, which corrects many of the reckless habits which an uninterrupted course of prosperity is sure to engender. We believe "A Mystic Student" and we are not very far from unanimity; but it seems as if we can not come to an understanding upon the use of outward means. He writes as if he denied their efficacy altogether, and yet attaches much importance to a selection of food which is not less outward to the mind than are clothing, and lodging, and social forms, which all affect the feelings as well as food, only through different senses. Food affects the mind through the sense of touch inwardly, and clothing affects the mind through the same sense outwardly; all the other senses are inlets to mental or physical sensation. Why should one sense be selected by a Mystic as physically important, whilst the rest are rejected? There seems a curious inconsistency in this. We are not disposed to dispute his doctrine about flesh-eating. He may be correct, but if he be correct in this, we must be correct in our idea of the influence of other externals. He is, therefore, in a dilemma.]

ON KNOWLEDGE.

DEAR SHEPHERD,—On reading over the papers of the Transcendentalist on faith and knowledge, I think I can discover in that writer an error, which belongs not exclusively to himself, but to all who attach too much importance to logical investigation.

The Transcendentalist confines himself to the mere investigation of propositions, without taking into consideration what is of far more importance; I mean position in relation to an antecedent, and prior to all proposition.

A proposition, subsequent to a proposer, is either analytical or synthetical; that is, it either enunciates the separating, or the putting together of two conceptions previously posited. The following is the process for the formation of a proposition: given two conceptions, A. and B, to find the relation between them; if nothing be given, there is an end of the matter, and we shall have no proposition.

Now, the propositions we have in view, are prior to reasonings; and positions, as I have shown, are prior to propositions; consequently, positions can be established by no process of intellectual investigation, but on the contrary, lie in the investigator as the basis of such investigations. The position must be in the being of the proposer, and if that being is in a disorderly state with the antecedent, of what value will be the propositions built on so rotten a foundation?

The love of subsequent propositions has, I think, induced the Transcendentalist, to make action depend upon a decision in favour of one of two such propositions. He has come too hastily to this conclusion. Why may not action sometimes be the immediate result of position?

I am thoroughly convinced, that the Transcendentalist has no notion of being as distinguished from relation. You will observe, that he makes every thing depend on the union or collision of two contradictions. Hence, by adopting a system,

which in itself involves a contradiction, he is able without the slightest appearance of inconsistency, to take up the cudgels for two opposite parties, at the same time declaring that he is but exhibiting different parts of one whole. Hence, after seeming for some time an almost super-sensual idealist, he now openly declares in favour of sensualism.

This system shows a restless state of being, and can only spring from one who is eternally at variance with the position of the antecedent. I would exhort him, as well as his readers, to note that Being which is self-sufficient, and in an internal state of rest, rather than run after a spurious something, whose very element is war.

Two lines will contain a summary of my own and the Transcendentalist's theories:—

THESES, OR POSITION.

Prior to synthesis and antithesis.
Theory of Peace.

Synthesis and antithesis with nothing
prior.—Theory of War.

As you have made your Magazine a vehicle for the expression of all parties, you will, perhaps, have no objection to insert the above.—Yours, &c. ANNAPHEL.

[The above, from an unknown Correspondent, apparently one of the fallen angels, we insert as an act of justice, although we do not wish to enter into so metaphysical a controversy. It seems to us a most unprofitable species of logomachy, or word warfare. Position, independent of relation, we cannot conceive. A proposer, independent of a proposition, and *vice versa*, we cannot imagine. Synthesis and antithesis exist necessarily in thesis. They are the eternal trinity, which cannot be separated, even in idea. "Action the immediate result of position," without any reference to relation, is downright nonsense. This is carrying self-sufficiency to the very maximum. Annaphel must be aping God himself; yet even God himself cannot be so far self-sufficient as to be independent of relation. His own creations are his re-agents. We are firmly persuaded that all our metaphysical and mystical friends are in the bottomless pit; and if Annaphel does not contradict himself, it can only be because he is in the grave of position without relation—the palace of "NOTHING." If the Transcendentalist run into materialism, or sensualism, we shall blow him up immediately. Our own position is a relationship between spiritualism and materialism. There we have stood for years, and there we are more firmly fixed than ever. We are confirmed by the wild vagaries and self-sufficiency of the two extremes.]

NEW EGYPTIAN ROOMS—BRITISH MUSEUM.

WE have paid two short visits to these rooms, and have been highly gratified by their interesting contents. It requires no learning to understand and fully appreciate the value of the greater portion of the memorials of ancient times, there, after a concealment of thousands of years, revealed to the wondering eye of modern civilization. The mummies are fresh and beautiful, perfectly inoffensive, and the clothes in which they are wrapped, have a cleanness and freshness which both please the eye and amaze the fancy. One especially, the mummy of a priestess of Ammon, appears as if she had been newly tied up, with the exception of some decomposition at the point of her toes, and about the back of her neck, which are partly exposed. The countenance is very clearly expressed. You could almost tell the age of the lady. She died in the prime of life, strong, and well formed, and possessing considerable personal beauty—her breasts are distinctly visible under the wrapping. There are also mummies of children, one apparently still-born—mummies, also, of numerous animals, crocodiles, hawks, ibises, dogs, cats, cattle, and sheep.

Besides these, there are numerous relics of art extremely interesting—chairs and stools, of simple and convenient form, made of wood. There is also the wooden model of a house, with a woman preparing bread, and an oven with three doors beside her; there is a stair, with rude steps, to the floor above, in which sits a female at rest, after the Egyptian fashion, her

hands on her knees. Numerous vessels of earthenware, very much resembling our own, especially that red ware so much used for kitchen utensils, such as pitchers, pans, basins, &c. There are also some curious specimens of Egyptian shoes, from the sandal up to the leather shoe, which latter seems to be made after the same plan as our own. There is a large collection of Egyptian fruit also, with Egyptian baskets of cane, and other material, to hold it. There are cakes of bread so very distinguishable, that even a child would point it out by its proper name. There are two ducks half consumed, but not carved, to give a relish to the bread, if you feel disposed to make a meal. Specimens of the whole domestic economy of that singular people are thus laid before you, even their ink-stands, pens, and specimens of writing are there, and you can form a pretty accurate estimate of their civilized state. There is a rudeness, and simplicity, and want of what we call taste, about every thing; but there can be no doubt that much scientific skill and inventive power must have been possessed by a people so near the source of time, yet displaying such progress in the arts, in the midst of a world of comparative savagism. There are some unbaked bricks, with the celebrated straw in them which cost the Jews so much labour to procure, in addition to their former tale of bricks. The bricks are very large, being twice as long and broad as ours; and, consequently, four times as large. You see, also, plaited female hair, and a large wig, probably worn by a judge, or counsellor, in excellent preservation, which, with a little pomatum to improve the gloss, might still be worn by a modern bald head. It is like the fashion of the days of Charles II., and not made of grey mares' tails, like the wigs of our modern lawyers.

Much light will, no doubt, be yet thrown upon ancient history by these discoveries, which, in general, confirm all that modest history has recorded of the sons of Ham.

MARRIAGE AND CELIBACY.

THE following tables taken from the *Lancet*, will be interesting to many who are desirous to know the relative effects of marriage and celibacy upon longevity:

ODIER'S TABLES.

| Mean duration of life. | In 100, there are alive at, | | Difference. |
|------------------------|-----------------------------|--------------------|-------------|
| | Married Females. | Unmarried Females. | |
| 20 | 40.33 | 30.62 | 9.71 |
| 25 | 36.04 | 30.51 | 5.53 |
| 30 | 32.38 | 28.86 | 3.52 |
| 35 | 28.86 | 26.24 | 2.62 |
| 40 | 25.54 | 23.38 | 2.16 |

Departieux, who composed a series of tables, comprising a total of 48,540 deaths, during a period of thirty years (from 1715 to 1744), says, in a cursory manner, "It would appear that people live longer in a state of marriage than in one of celibacy. The number of married men who die after the age of twenty, is nearly one-half less than the number of bachelors who die at the same period, and for 43 married men, or widowers, who attain the age of ninety, we find only six unmarried men reaching the same age. The number of single women who die after the age of twenty, is about four times greater than that of married females, or widows, dying after the same period of life; and fourteen virgins only (unmarried women) arrive at the age of ninety, for every 112 married women, or widows, who attain that advanced period of existence.

Dr. Caspar's tables furnished by Departieux, as follow; of every 100, there die,

| Period. | Married Men. | Bachelors. | Married Women. | Maids. |
|----------|--------------|------------|----------------|--------|
| 20 to 30 | 2.8 | 31.8 | 7.7 | 28.0 |
| 30 " 45 | 18.9 | 27.4 | 20.3 | 19.3 |

Again of 100, there are alive,

| Up to | Married Men. | Bachelors. | Married Women. | Maids. |
|-------|--------------|------------|----------------|--------|
| 30 | 97.2 | 68.7 | 92.3 | 72 |
| 45 | 78.3 | 41.3 | 72.0 | 52.7 |
| 60 | 48.1 | 22.6 | 49.4 | 37.2 |
| 70 | 27.2 | 11.1 | 29.2 | 23.7 |

| According to Biches, of Amsterdam, of 100, there die, | | | | |
|---|--------------|---------|----------------|---------|
| From | Married Men. | Single. | Married Women. | Single. |
| 20 to 30 | 3.6 | 33.1 | 4.7 | 26.5 |
| 30 „ 45 | 17.9 | 27.1 | 16.5 | 24.5 |
| 45 „ 60 | 29.2 | 15.6 | 22.6 | 19.2 |

TO THE EDITOR OF THE SHEPHERD.

DEAR SHEPHERD.—I have still been too much occupied to go on with Faith and Knowledge; it is a subject which requires much serious reflection.

However, having read your article, "*Individualism*," and observed another about *Theories of the Universe*, I have drawn a little sketch, which will be intelligible to you, and my own readers. You will find in it what you have said about "I," and what I have said about mystification:—

THE BEGINNING.

Being equal to Non-being.

Strife, or bipolarity,

GENERATION,

Or life, or physically, motion:
that is,

The confluence of the two poles.

How long shall this
process continue? —
What will be its re-
sult? — A turning
back, a reflection.

or
Consciousness.

THE END.

Explanation.—*Being* that is undetermined is the same as "no being." Determination implies strife: in all propositions that are not tautologous, the predicate differs from the subject. "*Omnis determinatio est negatio*," says Spinoza, "all determination is negation." What is called "The beginning" does not exist at all, it has merely a logical being. In the confluence of the poles is a real unity first manifest. The mystical fault consists in giving "The beginning" a high state of being, (as if, forsooth, the seed ranked higher than the choicest fruit), and seeking to elevate the "I" into that state, which is no more than destroying the poor "I" entirely, since it merely exists by the confluence of the two poles. Move it, if possible, into state above strife, and there is an end of every thing. Taking away one pole, and leaving the other, will have precisely the same result. A suicide, who disbelieved in a future state, would be a consistent mystic.

THE TRANSCENDENTALIST.

P. S. My poor misguided friend, the Ultra-Mystic, sends his love to his readers. The pump in his yard has this week failed

to inspire him. By the way, he is a most honest mystic; he openly acknowledges his nihilism, and glories therein.

A CLERICAL AGITATOR.—At the meeting in the Bazaar on Thursday evening, the Reverend Mr. Stephens said:—"We have sworn by our God, by heaven, earth, and hell, that from the east, the west, the north, and the south, we shall wrap in one awful sheet of devouring flame, which no army can resist, the manufactories of the cotton tyrants, and the palaces of those who raised them by rapine and murder, and founded them upon the wretchedness of the millions whom God—our God—Scotland's God—created to be happy!"—*Glasgow Argus*.

TO CORRESPONDENTS.

Astrologus.—The idea which we broached last week explains the phenomenon of the suspension of the planets in space, as well as the phenomenon of light and its formation; for, according to the theory, there is, first, a positive action towards the Sun as a centre, and second, there is a negative reaction from the Sun as a centre. The first is the centripetal, the second the centrifugal force. The confluence of these two constitutes the fulcrum, or balancing point. You may even explain thus the elliptical orbits of the planets; for in summer the North pole looks to the Sun; and therefore the Solar reaction must go out at the South, thus driving away the Earth. In winter it comes out at the North pole, still driving away the Earth. But supposing the positive, (North) as in the two sexes, to be more powerful than the negative, it is evident that, one half of the year, the repelling power of the Sun must be greater than during the other half, and thus it happens that we are 3,000,000 of miles nearer in winter than in summer. The objection of A., in respect to the satellites of a planet, is removed thus:—Light or heat, the original moving power, manifests itself in several distinct modes. Electricity, galvanism, and magnetism, are three of those terrestrial modes. Upon the same principle a planet acts upon its satellites, with a power corresponding to that of the Sun, but not interfering with it, as being of a distinct specific character. This power may be varied, ad infinitum, by reflection and refraction. If this theory does not explain the motion of the planets, it provides a railway for them to run upon. But even the motion may thus be explained; for, as we know that magnetism and electricity act at right angles to each other, i. e., cross-wise, so the combined solar positive and negative actions being through the poles, and the ecliptic being the plain produced by the shifting of these poles in their relation to the Sun, there is no resource left for the planet, but to run right on along the plain of the ecliptic. We have all the types in a common laboratory of the powers by which the planetary system is moved. The two poles of the Earth are charged with opposite electricities; the North with positive, the South with negative. The poles of the Sun have, no doubt, the same distinction. An iron rod, held upright on the Northern hemisphere, becomes positive above, and negative below, and vice versa on the Southern hemisphere. This idea, we believe, will soon set at rest the theory of planetary motion.

INDIVIDUALISM—PUBLIC AND PRIVATE INTERESTS.

Sum cuique tributo.
"Give every man his own."

FULL communion is a *beau-ideal*. It exists in imagination only. It never can be realized; for the moment it is realized individuality ceases. It is susceptible of a typical realization only. It is interesting to inquire how far the type may be carried.

Every individual being a centre of distinct being and consciousness, and in his central being unknown to every other individual—individuality is thus a remarkable feature of universalism itself. It never can cease; and, moreover, it has its own interests, its own feelings, its own motives and ends, as distinct as its own consciousness. It is not to the production and distribution of vulgar wealth alone, that the mind of an individual is necessarily or solely directed. If this were the only important consideration, we might grant the possibility of destroying individuality in motives, or swallowing them up entirely, in the great universal motive of wealth for the species, and equal distribution for individuals. But, vulgar wealth, although one of the first objects of consideration, is on that very account the meanest and the basest. Nature always begins with the lowest in the career of progress, elevating and refining as she proceeds in the development of the human mind.

We can fancy the influence of universal motives acting upon a million of men engaged in building a pyramid, in spinning cotton, in ploughing land, or in producing any species of manufacture; but what are the universal motives which induce two individuals to sit down to play a game at chess? or one individual to amuse himself, like Prince Potemkin, at *solitaire*? This last case is an instance of pure individualism—a species of monachism, which is very common in society. What is the motive which induces the angler to forego the pleasures of social life, to court solitude, to entreat his sporting companion to retire from his vicinity, and leave him alone to the enjoyment of his pastime? or the sportsman in the moor, with his dog and his gun, to avoid the company of his fellow sportsmen—the social crack of whose instruments of destruction he hears with a nervous irritation, fearful of treading over ground which has been scoured and unfeathered by another party? It is the individualism of which we are treating.

Some of the disciples of a new moral school, however, might object to these specimens of individual feelings as vicious propensities—the relics of a barbarous age of animal persecution and cruelty—which will flee before the dawning of justice and mercy in the human mind. Let us, therefore, take a more noble instance of the individual spirit. Let us make a sketch of the student in his closet, of the botanist in his garden, of the bird-fancier, of the entomologist, the geologist, the artist, the musician, &c. All these are individualists. Their feelings may be partly social, but they are always partially individualized, and always most individualized in the greatest minds. The student, whose chief or only motive for study is public applause, and not self-satisfaction, is a student of an inferior cast.

The botanist, who studies the properties of plants, merely to enjoy the satisfaction of describing these plants to others, or publishing books, or writing magazine articles on this interesting department of science, is not a genuine enthusiast. He loves botany as a means, not as an end. His end is applause; and if applause could be gained with equal facility by hoeing potatoes, he would hoe the potatoes, forsake the other nurslings of Flora, and rejoice in the culture of potato flowers and bullets. The artist is particularly unsocial as an artist. Like every man of genius he loves applause, and admits the love thereof as one of his most powerful stimulants; but there is an individual satisfaction in his art which none but an artist knows, and to which satisfaction every genuine worshipper of the graces has sacrificed both time, and health, and fame; led by his own individual feelings alone, independent of all social considerations, through wild and trackless regions of thought and experiment, which are real madness to other men, and seem like madness to his own reflection, when the hallucination is extinguished.

How can such feelings be universalized? How can they even be subjected to a law? How can we legislate for them, unless it be to encourage or discourage them? Bend them you cannot, without destroying the gem of humanity—without extinguishing the light of genius, and burying the human mind in brutish stupidity and sensual grossness; for, whatever may be said of the sensuality of artists, the productions of art have a refining tendency upon others, even though the producer himself has failed to reap the benefit he confers. The labour of production is sometimes overdone, and the mind once unbent, is apt to recoil into the opposite extreme of its most approved condition. Again, if you encourage these individual feelings, you depart from universalism *en masse*, by developing an individual peculiarity, which is selfish by Nature.

Let us suppose a society in which perfect community is established, where there is no individual property—where a man's own clothes are not his own, but he possesses them by sufferance or courtesy, only because they fit him—where even the plate of meat with which he is served for dinner is not his, but he is suffered to eat it, because he may as well eat it as another. In such a state the individual has nothing, and yet everything, but he has every thing in the same sense, as every other individual has every thing by common sufferance—subject to certain laws, which declare, that all that is necessary for *man's* comfort and happiness shall be given to individuals.

"All that is necessary for *man's* comfort and happiness." Well, this is a large promise; but, analyze it, and you find a defect. It is the *genus* man, the *homo* that is meant, and not the individual. The individual is only promised *all* that is necessary for the comfort and happiness of the *homo*. Now, we solemnly declare, that this will not satisfy us. We have an individuality that none but ourselves can understand—an individuality so distinct from the *homo* or universal man, that all the eight hundred millions of men together in council could not determine, even by an unanimous consent, that which is necessary for our individual happiness, much less could a committee understand it. To subject us, therefore, to a committee who

had power to determine what was, and what was not for our good bodily, intellectually, or morally, would be an act of deliberate murder committed upon our individual feelings—an act too which would prove in the general practice a complete check to the progress of invention, and the efforts of original genius.

We shall mention a case, in order to give a practical illustration of our meaning. There is a community of 2, 5, or 10,000 individuals. Amongst these, there is a crack-brained contemplative witling of eccentric notions, fond of solitude, wild in his fancies, informal in his habits, tired of dull realities, and given, like Mahomet, to take nightly rides,—sometimes daily, on the beast *Alborak*, into the world of imagination. He invents, in imagination, a new instrument. He imagines a new process of mechanical action. He desires to make a practical experiment, without which the imagination cannot be tested. Though possessed of everything, yet he has nothing except as other men have it, as the genus *homo* has it. He wants iron, wood, maybe silver and gold, and divers species of workmanship. The genus *homo* has got all these, but it has got them in the way that *he* does not want them. How is he to procure them? Individually he has no right to them, and, if he obtain them at all, it must be by permission of a committee. Before that committee he presents himself; the committee do not understand him. Who can understand an original? They judge of him by his acquired character. "He is cat-witted," says one. "He is a conceited fool," says another. "Can any good thing come out of Nazareth?" says a third, and the poor fellow is dismissed with a sage *material* advice to clip the wings of his imagination, and pay more attention to the *realities* of life. This sentence breaks the poor fellow's heart, and society loses the reward which, by a little indulgence, he would have ultimately conferred upon it. Genius cannot be discovered either by reputed character or by phrenology. It assumes every form, from the sluggish up to the fop—from the melancholic up to the wit—from the heavy to the light. A committee is the worst bar in the world before which to examine it—a rival genius is blind to its merits. It thus becomes *individualized*, and being individualized, it must have a sphere of individuality to move in.

Such is our mode of reasoning with regard to individualism; but, as to the extent of that sphere, we confess that we cannot settle the question. Experience alone can prove the ultimate judge of that. There must be individual rights, or circles of individuality, in which the individual moves and acts as sovereign, and which must be accounted sacred by every other individual, as territories to which he has no right, and which it must be illegal and criminal to invade. These circles ought to be susceptible of enlargement by the individual himself, otherwise they become the same as nothing. He must have the privilege and the means afforded of amassing those objects to which his individuality looks for its greatest amount of happiness. Many of these cannot be found in public institutions, for individuals become, by original genius, the *nuclei* of new sciences, institutions, and museums. If no individual sphere, and that a growing or increasing sphere, is permitted, the formation of such *nuclei* is prevented for ever. Now, what is a growing individual sphere? It is a sphere which an individual enlarges by the collection of property to which he alone has individual right—That growth can only proceed in a state of inequality. He must have the power to collect, and others the inducement to aid or concede—an inducement distinct from sympathy, for genius cannot be sympathized with. It must be an inducement peculiar to the individual, and the two individuals can only co-operate by mutually humouring each other's tastes. This brings us either to money or barter; and money and barter bring evil in their train—all the evil which springs from selfishness, which includes the whole mass of human wickedness.

We have, therefore, fire on one side, and water on the other. We are in a sad dilemma. We must either fall into a state of perfect conservatism and stagnation, the grave of genius and the fine arts, which all belong to individualism, or we must continue to preserve the immoral temptations which corrupt the selfish nature, and alienate the hearts of individuals from one another. There is this difference, however, between the two,

that the one is an unprogressive, the other a progressive state; and man being a progressive being, we cannot admit the possibility of that progress being interrupted by any political or social system. But although a progressive principle must exist, it is probable that that progressive principle may require the smallest possible momentum or impulse to keep it up; and it may be admitted in a variety of ways, by no means incompatible with the general idea of a social system. Vice, we feel confident, can never be removed without the establishment of a social system, and moreover, we feel so certain, that, with tolerably intelligent individuals, not fanatical, either as materialists or spiritualists, experience would soon correct the errors of theory, that we would rejoice to see any one of the social systems put in force upon an extensive plan. They are *one* in idea. They are merely modes of the social system, which is a conception belonging to man the genus, and brought out by individuals according to their own individualities, but only to be realised by combination, so that no individual's social system ever can possibly be satisfactory. It is only *the* social system which can satisfy man, and man only, not a man, can devise it. It is the universal system, and the production of the universal man. Of this universal system the *Shepherd* is a type, inasmuch as it brings forward the most remarkable social ideas for comparison and combination.

But let us return to the progressive principle. Owenism wants it; Fourier's system has, probably, too much of it, amounting to an inducement to crime; and St. Simonism is too indefinite upon this subject, relying too much upon the moral influence of governors and teachers, and too little upon the forms of social life. But these three systems seem to us to include every social idea. The mere materialism of the Social System is all found in Owen and Fourier, and the spiritualism is all to be obtained in Fourier and St. Simon. The material universality is all to be found in Owenism, and the individualism is found in Fourier and St. Simon. "*Chacun selon sa capacité et ses œuvres*;" each one according to his capacity and his works.

Mr. Owen himself allows that there must be an inequality in individual power, because Nature has created an inequality, and because in a school there must be a governor, and in a factory a superintendent. Here, then, is necessarily a beginning for the progressive principle, and for the principle of evil, without which, we maintain, no society can exist. Ambition is a passion, and power is the food which nourishes it. The passion for power is equivalent to avarice, or any other passion. It is, probably, the strongest of all. It has caused the greatest amount of crime. Pitt, Walpole, Cromwell, Napoleon, cared not for wealth, but as the means of gratifying ambition, and they shed blood, and corrupted men's hearts with money, for power alone. A system which harbours this passion, and how can you get rid of it? harbours as great a devil as the "*auri sacra fames*," the cursed appetite for wealth, or gold. Mr. Owen's system harbours this passion to a certain, but limited extent. Now the query with us is, why not permit the other individuality of private property in wealth, to a corresponding extent with the private possession of power? A man acquires power by talents, by moral character, by consistency and steadiness of conduct; why not acquire property by these means? But his power is limited to himself; it is not hereditary. It is thus far incorruptible, as it rises and stands upon virtue. Were individual *wealth* subject to similar restrictions, it would be equally innocent as individual *power*, and moreover, there would be a consistency in the system; whereas at present there seems a kind of discord, different departments of the system being subject to adverse or contrary laws.

In all that we have now written, we have merely been revealing the laws of Nature. The facts are as clear as the laws of gravitation. But it is very necessary that they should be openly acknowledged by all who are eager to convince the world of the necessity for a social system. Even were the *beau-ideal* practical, it could not be suddenly erected; there must be a gradual procession towards it. But the *beau-ideal* belongs to the imagination alone, and the truly practical man is he who discovers the distinction between the approachable and the unapproachable, keeping the unapproachable always in

his eye as a horizon towards which he bends his way. The unapproachable is an imaginative system; and it is a remarkable circumstance, although we can perceive it in all extreme cases, that that very system which most zealously decries the exercise of the imagination in the spiritual department, is the most imaginative of all in the material department. We do not dislike it on this account, that is, on account of the imagination; to this it owes all the moral influence it possesses. Being destitute of the spiritual, it would have been a mere radical doctrine without this imagination, which has elevated it above the world, and given it a species of religious character, without which no system can ever be rendered sublime enough to awe and endear the souls of men and women. But we would rather have the imagination of Owenism transferred to the spiritual department of being, and removed from the practical, which is not its proper sphere. You cannot soar too high in the spiritual department, if your practical department is well based upon material or physical laws; but if you confound the imaginative with the mechanical, you spoil the operation of the whole system.

We have said very little about the mystics this week, but individualism is only practical mysticism; for every individual is a self-centred political power, having a distinct individual interest more or less valuable, which more or less valuable interest society must acknowledge and defend. Mysticism carried out into the material world would lead to the individualism we have attempted to delineate, and there is sufficient universality in it to admit of the Social System. The mystics are not broad enough in their views. They closet their thoughts, magnify trifles, and ride upon puerile hobbies, and bury in oblivion some of the finest minds and the best hearts that society encloses within its bosom.

ST. SIMONISM.

Of all the social systems ever promulgated, St. Simonism has proved the most electrical in its influence on the imagination, and although the party is now nominally dead, it has sowed the seeds of new political, social, and religious ideas, which have revealed their vital principle of being in the whole of the liberal press throughout the world. The principal feature of this system is an analysis of the past, and a synthetical conclusion deduced therefrom respecting the future. It glories in the name of the religion of progress, and in harmony with this profusion of progress, it traces the movements of the human mind from the earliest sources of historical information to the present time, arranging the whole story of human society into a systematic form, so as to constitute a science disclosing the laws of the development of the human mind, and the process by which the Creator has doomed the moral and intellectual creation to pass to the ultimate state of social and political organization. The organization, or ultimate stage of this progressive movement, is, in our opinion, the most imperfect department of St. Simonism. Its historical philosophy we very much admire, and to this we believe it was chiefly indebted for the vast array of talent which at one time it presented to the quaking apprehensions of the French king. In the hands of the St. Simonians history was not merely an old almanac, but a living, a universal fact, a philosophy, a religion of practical application, the sire of the present, and the grand sire of the future. The vulgar only know St. Simonism by its vulgarities, its supposed community of the sexes, and of property. Upon these subjects there was much variety of opinion, and the writings of the St. Simonians declare nothing positive. Of the philosophy of St. Simonism the public know nothing. That is too refined a subject for vulgar consideration. This philosophy is to us its principal charm. It was more a philosophical than a practical system. For this reason it was spurned by many who were anxious for a new social system, but who had no higher ideas of social perfection than mere mechanical arrangements. Unfortunately the two parties, the philosophical and the practical, cannot unite; and thus both parties fail of success for want of the indispensable aid of each other's attributes.

The view of St. Simonism which we now present is as short

and concise as possible. We have taken the St. Simonian chart, a large sheet, four feet four inches, by two feet two inches, of which we give almost a literal translation, making only such changes in the arrangement of the ideas as are indispensably necessary in converting a chart into an ordinary prospectus. It takes the *a priori* form, commencing with GOD, with whom also it concludes—as first and last.

“God, the infinite universal being—all that is—all is in him—all is by him—all is HE. He is in his living unity—LOVE, and in the modes of its manifestation—love is, *first*, intelligence and wisdom; *second*, power and beauty. The first are the aspect spiritual, to which corresponds Man, or self; that is, individuality. The second are the aspect material, to which corresponds Nature, or that which is external to self.

MAN, the human being—man and woman, a being collective and progressive, a finite manifestation of God; like God, he is in his living unity, intelligence and wisdom, power and beauty.

The *spiritual* aspect of God in man, and in external nature, has been developed chiefly by Christianity, of which Catholicism is the social realization.

The *material* aspect of God in man, and in external nature, has been developed chiefly by Fetishism, Polytheism, and Jewish Monotheism.*

His destiny is to increase without ceasing in God by the progress of science, of RELIGION, and of industry. This progress is the law of humanity, of which the two great aspects are ANTAGONISM in the past, and UNIVERSAL ASSOCIATION in the future.

ANTAGONISM IN THE PAST.

The social organizations of the past, all based upon an imperfect knowledge of God and man, and never having been constituted directly for progress, have been successively overturned to make way for new organizations more in accordance with the new wants of humanity.

The most vivid expression of Antagonism, which forms the general character of the past in comparison with the future, is WAR, of which the end is conquest, and the result the oppression (*exploitation*) of man by man.

In the societies of antiquity—slavery and international war. Under the empire of Christianity itself Antagonism existed: whether in the bosom of society at large, under the form of contention between the temporal and spiritual power; or whether in the temporal power, by the bondage and division of its kingdom; or whether, in fine, in the spiritual power itself, by the contention between the different national churches and the Church of Rome—between the regular and the secular clergy, and the different monastic orders themselves. In all this historic series *woman* is condemned to slavery or subalternity. Man alone is the *social individual*.

Perfectability being the law of the human race, we always perceive the progressive principle transferred to another people, when that people with which it originated has been arrested in its development. It is thus that the civilizations of the East have been received in Judea and in Greece, which were incompatible with the stationary constitution of the primitive social order, of which the system of castes is the principal feature. Thus, also, the dissolution of the Roman empire became a condition of the political establishment of Christianity, although Christianity was born in the bosom of the Roman empire itself. But the interior constitution of that empire, founded on slavery and war, prevented humanity from making the progress which it had to accomplish.

The most general fact which the development of human societies presents, that which embraces most implicitly all others, is the progress of the religious or moral conception by which man perceives a destination. Political government, the regulation of social relations, is the realization, or *putting in practice* of this conception.

Character of the law of Progress.—The tendency of humanity to extend the circle of association, in approaching with-

* We beg leave to add Protestantism, which is the material aspect of Christianity, as subjecting the Church to the civil power.—E. S.

out interruption universal association; antagonism and war decrease in proportion as this circle of association is extended. The manifestation of progress by two alternate movements, the *organic epoch* and the *critical epoch*. The increasing division of labour—more and more perfect combinations of the efforts of association—a tendency more and more decided to give directly for a basis to the division of labour, and to the combination of efforts, the three grand fundamental capacities of human nature, viz.—

1. *The Intellectual, or Scientific Capacity.*—In their historical development the sciences are subject to all the transformations of religious dogma. Thus they are *Materialist* when religion is material; and *Spiritualist* when religion is spiritual. Like religion, they have the epoch corresponding to *Fetichism*, in which every phenomenon has a cause peculiar to itself, or rather, is its own cause; the epoch corresponding to *Polytheism*, in which man, rising to more general abstractions above the world which surrounds him, and above his own existence, connects by these abstractions a certain number of phenomena formerly isolated; the epoch corresponding to *Monotheism*, in which all the phenomena are attributed to one cause. Thus we can affirm, that in every organic epoch science has been *theological*, since it was in the temple, and by the priests, that it was cultivated. It has become partly *theological*, partly *Atheistical*. It has become divided with sacred and profane science as often as men began to *protest* out of the temple; and frequently, even in the temple, against the ancient creeds. In fine, it has become completely *Atheistical*; and, then, the name of *negative* agreed better with it than that of *positive*, since the anarchy which existed in the temple, existed also in the academy; that is to say, since general science having disappeared, there remained no more than particular sciences without any bond of union.

2. *The Sentimental, Religious, or Social Capacity.*—The religious or social development of humanity comprehends, up to the present time, two great epochs—one during which humanity did not conceive *life*, and did not perceive destination, except under the material relationship. To this first epoch correspond the principal terms—*Fetichism*, *Polytheism*, *Jewish Monotheism*. During the whole of its continuance, war and conquest constitute the end of general activity, and the religious bond of association. The second epoch is filled by *Christianity*, under whose empire man conceives life, and feels destination under the spiritual aspect. The doctrine of the *reprobation of matter* then makes way for the division of power in spiritual and temporal; war, although it has lost its primitive character of barbarity, still remains the attribute of temporal society. Spiritual society is pacific. But the dogma of this society not sanctifying material activity, the labours of this order, even the pacific, such as the physical sciences and industry, develop themselves out of its law, and remain subaltern.

To each of the progresses of religious development correspond the increase of hatred and of antagonism, the progress of love and of association. Man, who at first mercilessly killed his vanquished foe, or devoured him, now made him a slave; the condition of the slave gradually improves; the slave becomes a serf, and the serf, enfranchised by Christianity, becomes a farmer, or a hired servant. At this last term, generous sentiments find themselves prepared for universal association. War still exists, but its end is no more the oppression of man; the interest of industry is not its only motive. It is the strife of progressive with retrograde classes, on the one side to promote, on the other to prevent, the development of a new social principle. Then war becomes the war of civilization.

3. *The Material, or Industrial Capacity.*—Industry has been a slave, or subordinate, in all the stages of the past; but it is easy to demonstrate its progress in the development of historical facts. At first it gradually comes out of slavery, which was its primitive condition, and in which it remained during so long a series of ages, under the empire of all religions anterior to Christianity. After the enfranchisement determined by the progress of the morality of the Gospel, we see the Commons, that is to say, the industrial corporations, formerly serfs, introducing themselves, in the thirteenth century, into the political assemblies in England and France, and admitted, by their representa-

tives, to give their advice for the raising of subsidies. At the same epoch we see several towns in Europe constituted cities, independent industrial confederations; witness the *Hanseatic League*. Military enterprises becoming every day more costly, and the riches of enfranchised industry assuming at the same time an always increasing importance, we find the relation of political chiefs with the industrial class multiply more and more, become more and more intimate, and each of these approaches brings new advantages, new concessions, in favor of industry. Military enterprises themselves did not fail to receive a new direction, which contributed more and more to the interests of industry, with which they could no longer dispense. Now, the material end of war is no longer, as formerly, to invade a territory, and make slaves, but to obtain over a vanquished people a *commercial privilege*, a *monopoly*.

Societies have passed alternately through two kinds of epochs.

1. *Organic, or Religious Epochs.*—Humanity perceives a destination, and from this fact results a determinate tendency for social activity. Education and legislation cause all actions, thoughts, and sentiments to converge in a common end. The social hierarchy becomes the expression of this end. There is, then, in power both sovereignty and legitimacy, in the true sense of the words.

Order and confidence reign in society; there is a perfect harmony between the will of the superior and that of the inferior. Election then acts from high to low, because in fact the superior capacities are found at the top of the scale; but so soon as the acclamation of the inferior no longer replies to the word of command, whatever be the sanction given by military power to ancient authority, the organic epoch is virtually dissolved; disorder exists in its bosom, just until an organic principle, more complete, be produced. The history of the progress and fall of the Catholic hierarchy is that which represents, on the largest scale, and in the most distinct manner, the passage of humanity from one critical epoch to another. So that humanity finds itself to-day in a state similar to that in which the Roman Empire was at the appearance of Jesus Christ, that is to say, an epoch of termination and renewal, placed at the limits of two worlds, awaiting with anxiety the revealer of its new destinies. At this epoch the *Man Divine*, the Man of Progress, already manifests himself in the person of St. SIMON.*

At these epochs man loves the destination which he feels on all sides; he feels himself carried on towards the end which he desires. This power which directs him he calls *Providence*, and he adores it. Then he is active; for he runs with all his power to the accomplishment of his destiny. Then he feels himself free, for that which he does for this end is that which he loves the most, and liberty for man consists in loving that which he ought to do.

The historic series, with which European civilization is directly connected, presents two organic epochs. The *first* is constituted by polytheism, and terminates at the beginning of the philosophical era in Greece; the *second* commences with Catholicism, and closes at the end of the fifteenth century.

2. *Critical, or Irreligious Epochs.*—Humanity no longer feels its destination. Society has no more an end of determinate activity. Education and legislation are uncertain in their objects. They are in contradiction with the manners, the customs, and the wants of society. The public powers are no longer the expression of a social hierarchy. They are deprived of all authority, and the feeble action which they continue to exercise is even contested. It is then that, at the name of liberty, men placed at the bottom of the social scale claim as a right the privilege of electing their chiefs; and we may say, that it is truly a legitimate right, since, in fact, a society at a *crisis*, or in the critical epoch, is nothing but a society in which those who are at the bottom ought to be at the top, and those who are at the top ought to be at the bottom. Election, from the bottom upwards, is then a necessary security for the oppressed

* Simon is the complement of Peter (Simon Peter), the first preacher of Christianity—the rock—and no modern doctrine illustrates better the nature and destiny of the Christian dispensation than St. Simonism. A genuine St. Simonian is in faith and practice a Christian.

against the oppressor; but when the oppressed interest has triumphed, the security which it claimed having ceased to be necessary, the hierarchy is re-constituted, confidence in authority is re-established, and the people concede freely to those who govern, by right of capacity, the power of which they have need to fulfil their mission.

At these epochs no sympathetic attraction carries man towards the future. He feels himself moved by an irresistible impulse towards an end of which he is ignorant, and which creates in him nothing but fear. This impulse, which moves him despite of himself, he calls *Fatality*, and he curses it; then he is passive, for it is without his participation that he accomplishes the movement to which he yields. He is a *slave*, for he feels himself oppressed.

The historical series, with which our European civilization is directly connected, presents two critical epochs. The first dates from the appearance of the philosophers in Greece, and extends to the preaching of Christianity. The second comprehends the time which has elapsed from Luther to St. Simon.

The terms of development of the collective or social existence of man have been—

The Family—Primitive and most restricted circle of association.

The City—Political union of many families.

The Nation—Association of many cities.

The Church—Union of many nations in a spiritual communion.

(To be concluded next week.)

INQUIRY INTO THE RELATION BETWEEN FAITH AND KNOWLEDGE.

ESSAY III.—WHAT FAITH IS.

By the Transcendentalist.

As far as we have yet considered, the placing a proposition under this or that particular category involves no moral depravity. We have now to inquire how the appellation "infidel" comes to be a word of reproach.

The deistical party will cut the matter short, by remarking that the abhorrence of "infidelity" is a mere prejudice. So it may be! but an abhorrence which exists in the minds of a great part of civilized Europe, must at least be a psychological phenomenon, which requires consideration.

Without entering into any deep metaphysical discussions, I think that it will be obvious enough that moral depravity can only be predicated of the will, not of the understanding. Whether my use of the word be justifiable or not, I here mean by "will" the desiring faculty (*Begehrungs-vormögen*), so far as it energizes towards the attainment of an object.

That a man is only held morally responsible for the direction of his will, appears from such popular phrases as "Poor fellow, he means well,"—"He has a thick head, but a good heart," and so on, *head* being used as symbol for the understanding, heart as one for the will. If we were told that a man had murdered his father, we should start back with horror; but if we were further informed that he lived in a country where aged persons were put to death, to prevent their enduring sickness and infirmity, we at once retract our abhorrence, and while we regret that the savage was not better informed, (*i. e.*, that his understanding was not better cultivated,) we at the same time acknowledge that the apparently cruel act was meant kindly. The most orthodox person would not be angry with a lunatic or an idiot for uttering the most blasphemous expressions; he would at once place the fault in the understanding, and not in the will, and thereby declare that he considered the afflicted creature morally irresponsible.

Indeed, a strictly immoral person must be assumed to have a faultless understanding, at any rate with respect to the acts in which his immorality consists. A man who does a wrong act, without knowing that it is wrong, is, before God, no more guilty than a lunatic or idiot. Hence, to constitute wickedness, two things are requisite: understanding, to know the right course,—will, to act precisely in the contrary direction. Thus, the lowest state of moral depravity is that of "knowing what is good, and not practising it."

A remark has just struck me, which is worth setting down. In respect of moral excellence, the goodness of the understanding is no cause of the merit. A man is a good man, who acts to the best of his knowledge, however erroneous that may be, and hence two persons who have two different sides of right and wrong, or who have, by their several reasonings, determined that contrary causes are right, are still morally blameless, so far as each has done what he thinks is the best. On the other hand, in respect of moral depravity, the understanding is a great cause of the blame. The clearer a man's notions are with respect to right and wrong, so much the more reprehensible is he, if he do not practise the former, while, if he knew no such notions at all, whatever he does, he cannot be either immoral or moral, any more than a stick or stone.

Human institutions are so far imperfect, that they are compelled to assume that every man has the same notions of right and wrong. They can recognise the existence of an absolute lunatic, but not that of a man who, by a false process of reasoning, concludes that the right course is the wrong. Hence, for the safety of the commonweal, they would be obliged to punish a man who killed his child merely to prevent it from going through a certain course of misery, just as much as if he were an ill-designing murderer. In other words, the faults of the understanding must often be treated as those of the will. When I made use of the words "before God" above, I considered "God" as a judge who would look not into actions, but into their motives, and this is the only perfectly moral judge that we can assume.

Acts are mental as well as physical, and in the acquirement of knowledge the will is energizing towards a certain end, as much as in the running of a race. Hence, if the end be morally bad, the student is as practically bad as he who mingles in practical life.

Suppose a proposition bears in itself the marks of truth, that it is an axiom, and that we heard a man violently endeavouring by all sorts of ingenious arguments to subvert it. If his perseverance convinced us he was not merely exhibiting his dialectical power, and the acuteness of his reasonings proved that his understanding was not defective, we should hardly know what to make of him. Suppose further, the proposition is a direct moral expression, implying that such and such acts were wrong, we should now comprehend the whole process, and consider that the man was willing to commit the very acts prohibited by the maxim, and for the sole love of those acts was endeavouring to subvert that maxim, not from an honest love of truth, but simply to check the citation of the proposition by any who might reprehend his profligate lip.

Knowledge and ignorance belong to the understanding. Love and hatred to the will.

We have now the relation between infidels and the religious world. Comparatively few of the latter have argued themselves into their belief; the very propositions which are doubted by the infidels, are by them set up as absolute axioms. They declare they have an internal evidence of their truth, which is calling them axioms in the strictest sense of the word. Hence, perceiving that the infidels are often men of acute understanding, they regard their arguments as springing from a hatred of the doctrines comprised in the proposition, and think all their subtle reasonings are but sophisms, and against their better sense, in order to justify their depraved desires.

All reasonings proceed from axioms. If one man will not admit another's axioms argument is useless. In vain will the rigid infidel endeavour to convert the stanch in faith; he is talking against the very axioms on which the other's whole chain of reasoning is built. They can no more communicate than if they were both deaf.

If we reflect on the two classes of preachers so well described in a leading article in the *Shepherd* some weeks ago, *viz.*: the

* What a sublime step in the human mind is monotheism! There is no obvious connexion between a moral judge and a creator. How natural would it be to make them separate deities, and what a noble advance was their union! Civilized man has acknowledged its justness, and polytheism is crushed for ever.—T.

Evangelicals and the Non-Evangelicals, we shall find a striking illustration of what I have advanced. The defenders of Christians are the Non-Evangelicals, they argue with the infidels that certain propositions are not axioms, and then, by an intellectual process, endeavour to prove that it is much more probable they should be true than false. So far are these polemics from being regarded by the so-called religious world, that their faith is even suspected. Who has not heard Paley called heterodox, and Warburton almost an infidel? We may often observe a kind of amicability between the polemical Christians and the infidels; thus, such and such a learned divine "cannot help regretting, that such and such an infidel has adopted certain erroneous opinions, but, at the same time, he cannot help expressing his admiration at the zeal after truth, and the great learning which are displayed in the writings of that gentleman." Nay, I once heard a high-church preacher declare in the pulpit, that an "honest infidel, like the Earl of Shaftesbury," had a good chance of salvation. The prototypes of this school have not faith in the Evangelical sense, but considering it as no more than intellectual conviction of course, do not regard the infidels with utter abhorrence.

The Evangelicals, on the other hand, having assumed their propositions as axioms, not as results of reasoning, of course can see nothing but moral depravity in an infidel. "He loves," they say, "darkness rather than light, because his deeds are evil."

Faith, therefore, in the religious-world sense, is the assumption of a certain proposition as an axiom, attended by the conviction, that the denial of that proposition proceeds not merely from false reasoning, but from moral depravity.

THE TRANSCENDENTALIST.

SELF-TORMENTORS.

WE have translated the following passage from the ecclesiastical history of Nicephorus Callistus, expressly for the consideration of our friend, "A Mystic Student." The characters delineated with great respect and veneration by the sacred historian, appear to us to be specimens of the highest order of mystical divines. They seem to have divested themselves of all those sensual and grovelling ideas which originate in the belly and the confines thereof. Forms they despised. Position alone was their state of being—they had no relation—they were omnipresent—they had no country, for they lived everywhere. No system of diet, for they ate any thing. Were neither respecters of persons nor of things, and no doubt could eat salt fish with as much relish as fresh cabbage. Probably we belie them, in saying they ate animal food. But the most profound mystic we ever met, a man totally beyond this world, Samuel Hearn, who died at Walworth last March, was so independent of all externals, that he care not whether food was clean or foul; he has told us, with his own mouth, that carrion was as pleasant to him as fresh meat. He would eat a raw potato from a dunghill, and he was so perfect a Celebs, that he lived in a cellar for many years, and would not suffer a woman, and no one else offered, to clean it. He did not even clean himself, and wherever he was, at home or abroad, in bed or out, there he performed the offices of nature. He was a deep mystic, and said many beautiful things. He had plenty of money, and was not a niggard in spending it; but, if he had seen you dying for want of a halfpenny, he would have withheld the halfpenny merely to get you off. He rejoiced in deaths and murders, saying, "that death was the greatest blessing that could befall us." He would have given the hangman a sovereign to hang you, but not a penny to save you, with a hundred besides you. He once saw a woman take poison. He walked out and said nothing. She was discovered and saved—when asked afterwards what was his motive for concealment, he replied, "I thought it was the best thing that could befall her."

The following are men of the same class as Hearn, the individuality only is different.

"The rumour is, that Eudocia twice visited Jerusalem, where she performed many things to the honour of Christ. For she raised many sacred monasteries, built *Lauras*, as they call the

narrow cells of the monks, and founded many schools of divinity, of which the institutes are indeed various, and the modes of living different, but they all tend to the same pious purpose. For some living in social communion in the same house, distracted with none of those cares which depress the spirits of terrestrial men, with them there is neither gold nor any other metal. No one appropriates to himself a garment nor any of those things which gratify the stomach. The man who wears to-day a cloak and hood, you may see to-morrow with some other garment, so that you may imagine that they have all one garment, or each garment belongs to all. To all a common table is spread, not covered with various high-seasoned and delicate food, such things, as when lodged in the stomach, irritate the body with lascivious feelings, but covered only with a few herbs and pulse, as much as is merely sufficient to support life. They have common prayers also, and supplications to God, which they perform during the day, and often throughout the whole night, with fear and a submissive condition and posture of body. They so reduce themselves by labour, that though living on earth, they seem more like dead men. They often extend their fasts to two and three days. Some there are, who for five days and longer will not touch food, and take it only when necessity compels them, and that with great parsimony.

"Some again there are who live very differently from these—separating themselves from society, they live alone, shutting themselves up in very small houses, whose breadth and length is such that they can neither stand upright, nor lie at full length, living in dens and caves of the earth, as an apostle says. Some dwell in the open air, with the wild beasts; others make use of subterraneous dwellings, in which they hold communion with God alone.* But there is another species of Divine communion practised by them, which far exceeds every other instance of human fortitude and constancy; secluding themselves in a parched desert, with that part of the body only veiled which Nature teaches us to conceal, both men and women competing with each other in the same mode of life, and taking no care whatever of the body, subject themselves to the fiercest extremes of heat and cold, and to whatsoever place chance directs them, there they remain, and there they lie down; utterly rejecting every species of human food, they live on the herbs and roots only which the earth spontaneously produces; for this reason they are called Bosc, grazers or foragers. In process of time their appearance is so altered, that they resemble wild beasts, and acquire a dislike to other men, whom, if they at any time behold, they flee. But, if they perceive any one pursuing them, they run with great swiftness, and seem, on account of their speed, to be wafted on the air. Sometimes also having entered inaccessible places under ground, they suddenly disappear, and many do this, that they may conceal the life they lead.

"I will mention another species of monastic discipline which I thought of omitting. It is considered by many as holding the first rank, and is practised by very few. There are some, who by many labours of virtue have attained a state in which they return to the world in an apathetic condition, indolent and free from all passions and feelings, and with certain disorderly gestures, feigning to be mad; they so despise vain glory, as the last covering which the soul is accustomed to throw off. In apathy, that is, in indolence, they philosophise without affection or mental emotion; they take their food if need be in a public-house or a brothel, respecting neither the persons nor places. They also enter baths, and bathe with naked women, and live with them, yet they are so superior to all affections and passions, that they subdue the impulses of Nature, and even exercise a tyranny over them—so that neither by sight nor by touch, nor by kisses and female embraces artfully sought, are they ensnared into lascivious feelings. With men they are men—with women they are women; and when they seem to possess only one sex, they have the capacity of both. In this kind of life, which overcomes the cravings of Nature, the virtue of Nature has established adverse laws, so that satiety cannot be experienced in any of those things which are

* Which God?

accounted necessities. They always hunger, and thus their laws compel them to preserve temperance and moderation in all things. They so strictly enjoin the restraint of the body, that even necessity itself is restrained by force. Their life is balanced in so perfect an equilibrium, that, as when the scales are in a horizontal line, no disturbing power is perceived. And so greatly do contrary things exist and mingle together in them, Divine grace conjoining those which cannot otherwise coalesce, and again disjoining them in his own time, that what is very wonderful to relate, life and death reside in the same body, though by Nature and character they be extreme opposites. For when any affection or passion has seized them, then you may perceive the body dead and inactive, as if it were deposited in the sepulchre. When, however, a great work of God is to be performed, and prayers to be poured out unto God, then you behold new strength, and a wonderfully active frame, although it was just now exhausted, and worn out with old age. They so interweave the present and the future life, that with bodies almost dead and buried they still live, and converse with the living, healing the sick, and commending the prayers of supplicants to God, living in the present life, except that they have no need of necessities, and are attached to no particular place. They are every where at once, hear all voices, and have converse with all. They are in the habit of making frequent inclinations of the knees, and placing themselves in severe postures, sustaining their bodies by desire only, and creating a voluntary imbecility. They are wrestlers without flesh, and strugglers without blood. To them a rigorous fast is a splendid banquet and delicious fare, and at a table richly loaded they taste no food. But if a guest should visit them from any quarter, even at an early hour, so kindly and benignantly do they receive them, with a new kind of hospitality, that you would suppose they thought of little else in life than to fare thus profusely; then, again, meditating some species of fast, and unwilling to gratify their appetites with any species of food, they astonish you to think with how small a quantity of food they can support life. They are their own enemies, the betrayers of their own will and nature, so that they may abstain from all corporeal delicacies, and the soul remain unpolluted in its own state. Whatever things are agreeable to God, these things they seek and preserve. They are happy in the pursuit of this species of life, but still more happy in their exit from life itself; to this desired end they earnestly aspire."

Such were the characters with whom the Empress Eudocia, the wife of Theodosius, conversed, when she proceeded to Jerusalem in fulfilment of a vow. She founded monasteries, hospitals, and Lauras, and did many other works esteemed pious by the spirit of the times, though calculated only to encourage rebellion to the sacred laws of our common nature.

"NEW SANCTUARY OF THOUGHT AND SCIENCE."

THE fourth part of this novel and interesting publication has appeared, and, in our opinion, it is the best. It contains many beautiful and universal sentiments, which we should rejoice to see extensively imbibed by the present generation. But what the author's ultimate design is, or whether he has a unique end in view, does not yet appear evident. There is a great variety of matter all arranged in short paragraphs, and illustrated by copious and numerous quotations from the works of other men, which must have cost the compiler much reading, and give relief and variety to his work; but they rather divert the current of his own thoughts, and injure the perspicuity of his plan as a whole. The title of this number is "Intellectual Education identical with progressive civilization." This, in our mind, has rather a mystical meaning. If intellectual education means merely an accumulation of facts or scientific knowledge, then we doubt the proposition; but if it means also a refinement of the intellect, we have no objection to the assertion. Refinement, however, is not produced by quantity, but quality of intellect. Why should intellect be valued by size and strength like a dray horse? Would a connoisseur in sculpture thus appreciate the value of an Apollo, or a Jupiter Tonans? Would he put them into scales, or take them to a steel-yard? A far-

mer may sell cheeses thus, and a ploughman buy watches thus, as they sometimes do; but the *civilisé* knows better, he values by something which nobody can describe, which he himself feels, but cannot well communicate, except by a species of circumlocution which costs him an effort, and yet does not convey the half of his meaning. Probably, our author means to include, ultimately, the refinement of intellectual education; but at present he almost threatens to omit it, when he says "ignorance is original sin, and knowledge is regeneration." If so it be, then some of the greatest scoundrels in London have made farther progress in the new birth than many of the sweetest tempers, and most liberal and tolerant spirits, of which our country can boast. We will not admit this, we protest against it. We hope the author will explain himself. Probably he errs only in expression, but if that expression has conveyed such an idea to our favourable minds, what must it convey to those who are disposed to condemn, and unwilling to receive even their own acknowledged truths from his pen?

This condemnation of both Spiritualism and Materialism we approve of. They are merely one-sided sectarianisms. His caution respecting *a priori* and *a posteriori*, as meaning nothing definite, is equally correct to a limited extent. It is impossible to reason solely by either process, every species of reasoning includes both. The end is in the beginning, the effect in the cause; and they have a concurrent action in every act of reasoning. Thus, when Columbus perceived branches of trees, roots, and sea fowl, in his adventurous voyage in search of a new world, he reasoned *a posteriori* from these facts to the existence of land in the vicinity. But land was also a *priori* idea in his mind, and he reasoned *a priori* that land would produce these effects when he approached it. Were any act of reasoning properly analysed it would exhibit the same kind of composite reasoning as this. Even chemical analysis is both *synthetical* and *analytical*.* When a chemist analyses water, and decomposes it into two gases, he performs an *a priori* act in breaking up a whole; but in his own mind he had previously begun with the parts; he wanted oxygen and hydrogen; he actually prepared tubes and retorts to receive them. In doing so he reasoned *a posteriori*, i. e., he concluded that oxygen and hydrogen were contained in water. Still, although every act of reasoning is both *a priori* and *a posteriori*, there is a distinction between the modes; and the reasoning faculty may be shown oscillating between the two in every process of reasoning.

As there is much more food for our minds in this than in any former number, we shall soon refer to it again. We have glanced it over very hastily. There is one defect, however, which we eagerly long to see removed, for without this the book, and every other book that professes to exalt and moralize the human mind, must fall dead like a petrified *foetus*, into visible being. It presents, as yet, only a chaos of universal being. Where is the universal mind? What is the basis of this new philosophy? Where is the *shekina* of this new sanctuary? Is there method in the progress of human civilization? what is that method? Give us the philosophy of *time*, as well as the philosophy of *space*, we want a knowledge not only of things as they *are*, but of things as they *run*. Knowledge has this twofold aspect, and history is the knowledge of time. We do not mean small story history—tales of battles, knighterrantry, lives and deaths of eminent commanders, but universal features of the historic movement, the dramatic plan of the comedy, or tragedy of humanity. Is it a unique drama? We say yes, a *DRAMA*. Our liberal philosophers make a universe of dust of it. In this way they help the clergy, who see no plan but Moses and Christ, and leave all the rest to chance and the devil. Why help the priests in this insane nonsense? What is there, or can there be in the universe, not methodized and converging in a preordained point? It is our firm conviction, that if there be no providential plan in the history of mankind, philosophy itself is a humbug. We ourselves see it most clearly. There is no science more obvious to our perception. We would sooner reject chemistry, astronomy, geology, and all the ar-

* Synthetical is a *posteriori*, from parts to the whole; analytical is a *priori* from the whole to the parts.

moury of useful knowledge, than the philosophy of history, which is Divine Providence. This is knowledge in time. Our author aims at this philosophy; but has he made a living organization of it? Let him look at one half of the St. Simonian religion in our present number; has he looked at history in this light? Or is he afraid of seeing too much, and revealing the presence of a living God? We can tell him with prophetic certainty, that until he perceives this living God, his new sanctuary will prove a temple of Janus, open only in time of war, and shut in time of peace, for a living and universal power is the basis and the apex of all philosophy. Nature is a dreary waste and a howling wilderness without it. In God alone can we hope for a methodic and satisfactory development of the great drama of life, but in a chaos, an electric agency, a chemical action, or any other senseless performer, we see nothing but execrable confusion for ever, with no certainty of the continuance of Reformation, should chance accord a beginning. A volcano or an earthquake may destroy it, a comet may sweep it up, the world itself may burst, or a great sun from the milky way swallow up and run away with our solar orb. A thousand catastrophes await a universe of chaos; but the wisdom of the highest order despises a chaotic basis, and what other basis but *consciousness* can there be which is not chaotic? A philosophy which is not based on universal consciousness—is chaos. We write thus in pure friendship and respect, for we think the author is within a hair's breadth of the truth, but that very hair's breadth is his equinoctial line, the passing which introduces him to another hemisphere, and another polar extreme of thought. Though denouncing Materialism nominally, he is, to all intents and purposes, what the world calls a Materialist.

GLASGOW COTTON SPINNERS.

LAST week we promised to return to the Glasgow Cotton Spinners' question, but as considerable public sympathy has been created for the convicts, upon the supposition of unfairness in the trial, or inconclusiveness in the evidence, we mean to wait for farther light. We should be very sorry, indeed, to exhibit any deficiency in zeal for the liberation of men who have been unjustly doomed to a punishment which they did not deserve, and what we expressed last week might lead our readers to suppose that this sympathy was awaiting. But we consider the guilt, if guilt there be, as a very different species of guilt from that of crime committed for private ends. Whatever the men did, they did from public motives, they did for the interests of a labouring portion of the community. Good was their ultimate object, and the principal guilt with which they are chargeable is the guilt of folly in expecting, or attempting to attain so important an object by such inefficient means. Had the conspiracy been directed against the rich only we might have excused it; but it was poor against poor—spinner against piecer, and piecer against spinner, and spinner against all the world besides. It had thus a tendency to break the ranks of the people, by creating popular animosities which would ultimately play into the hands of the aristocratical party. The mere act of union is not unlawful, and the attempt to fix wages is nothing more than the lawyers themselves, their own judges, have long done. They have even a court for reviewing lawyers' accounts, which are there taxed, as they call it, and reduced to their legitimate amount when overcharged. The working men have surely a moral right to do that which lawyers do; and if parsons are endowed, and their salaries fixed by law, upon the principle of vested rights, why should not all men have vested rights also? But what is the popular outcry respecting vested rights, hereditary privileges, and monopolies? That they ought to be abolished. And yet, in opposition to this popular outcry, raised and kept up by the trades themselves, they attempt to establish a similar system of privileges, which, if established, would only clench the nail of aristocratical oppression.

Were the Spinners to succeed in their object, they would gain nothing as a body. If they raised wages, they would reduce the amount of labour, and throw part of their number

out of employment, and do an injury to other tradesmen who could not combine (for many trades cannot combine,) to raise theirs. And, if all were raised in the same proportion, the markets would rise also, and as they say on Change, a par would be produced—the old level would return. A nominal rise of wages is merely a trick, which the currency would render of no use to the working classes at large; and, if a fraction of the working classes raised their wages, and monopolized their labour and its value, as was the object of the Cotton Spinners, the consequence would be, that through the sympathy and aid of the people, a portion of the people bettered themselves, and injured their neighbours; for injury it must be, to have the door of a profitable employment shut against you for ever, and probably bread raised in price on account of a higher rate of wages in a certain species of employment.

It is strongly asserted, that the individuals convicted are not guilty of the acts of violence said to be committed by the Spinners. We are willing to believe this, and indeed, the jury acquitted them of all the most criminal charges. Nothing seems to remain of guilt but a foolish scheme, which has produced much evil, and never can effect any good. For this folly transportation is too severe a punishment. It will increase the sympathy of the people, and cause them to overlook the folly of the convicts. Were they merely liberated with an admonition, both government and people would thus save a great deal of future agitation, which will doubtless be kept up till some species of tardy redress be obtained. The people in England are beginning to see the folly of "strikes;" the Scotch are merely a little in arrears. But, by a little indulgence, they will soon perceive that *national* combination alone can ever produce a truly *national* benefit to the working classes. The interests of parties pursued separately must always injure the rest of the community.

OWENISM.—We have read the very kind reply of the Editor of the *New Moral World*, and we have only room at present to observe, that it is upon what the *New Moral World* calls the *non-essentials* that we wish to correspond with him. We have no objection, for the sake of argument, to concede what he calls the essentials, with this qualification, that his essentials are not *all* the essential essentials. The basis of all philosophy, religion, and morals, is God. This is a universal idea, comprising all power, wisdom, and moral that exists, and mankind will never be familiarised under any other paternal name. As for liberality, it is a part of our religion. When we seem to depart from it, we are apostates from our own principles; we are beside ourselves. When we spoke of Moses and Christ, we spoke for Christendom, not for ourselves. Our universalism includes all religions; but as man and woman are the highest animal revelations of God, so Jewism and Christianity are his highest religious revelations, and *are not more true nor more good than man himself is*, who receives and manifests them.

TO CORRESPONDENTS.

Mysticus Junior we have reserved for next week, as he could not with spiritual propriety take the precedence of the Elder, and six pages of the Shepherd were made up before we were in possession of both. We wrote thus far upon the supposition that "An Old Mystic" was inserted in this number, but the compositors have reserved his letter for next week on their own authority.

[PRICE 1½d.]

OWENISM.

"Where Christianity is received amongst them (the Indians) with any efficacy, it appears to be exactly in proportion to the skill of the Missionary in associating the new truth he brings with that which was already sanctified in their hearts, in proportion as the new religion is made a SEQUEL of the old one, instead of a substitution for it."—*Miss Martineau.*

THE above quotation from Miss Martineau contains a science which modern socialists would do well to study. By neglecting it they baffle their own plans, and resist the ordinances of Nature in the laws of progress. The present is the offspring of the past—the future is the offspring of the present—the link of relationship runs down the course of time; and, where is the man who has power to snap it?

This observation is suggested by the reply of the Editor of the *New Moral World*, of which we made mention in our last Number, though not intended to controvert anything advanced by him, but rather in pointed language, to express the principle of our religious philosophy.

After some complimentary observations, which our modesty refrains from quoting, and some logical distinctions clearly expressed, which we feel inclined to concede, because we regard them as true, the writer proceeds to show that the religion of the Social System is practical religion. So is ours; and we agree with our friend in his poetical delineation of the religion of works, proceeding of course from the antecedent feelings of the heart.

But now comes the tug of war. "Mr. Smith does not stop to elucidate his argument with us in this practical part of our religion. He goes at once from the essential to the non-essential." Here is the point of dispute. Is it essential or non-essential that a religion be based upon the fact of the Divine unity and Providence? We say in the most positive term, *essential*.

The writer admits the probability of a Divine Providence. "Yet (*he says*) we assume not this ground as certain, but as rationally conjectural, upon the score of knowledge hitherto acquired; and we question in any one the right of dictation to others without the concurrence of facts universally known, which, by their own direct evidence shall be conclusive, without the meretricious aid of verbal authority." The right of dictation we also question; we should be very sorry to assert it, and very reluctant to acknowledge it. We prefer the voluntary principle. But, if we assume no principle but that which is conclusive without the meretricious aid of verbal authority, we shall reject all principles that are founded on external facts not known to all, and all internal feelings not perceived by all, and we shall have very little left; but, even that little that is left will include what the *New Moral World* calls our *non-essentials*.

The fact of the unity, wisdom, and power of the Supreme Agent of Nature, is an *axiom* not to be demonstrated by knowledge, vulgarly called scientific, but to be *felt* as the basis upon which all knowledge is built, as the unity from which it comes, and the converging point to which it tends. The part

cannot demonstrate the whole. The whole needs no demonstration; it is an eternal axiom, an indemonstrable fact; the denial of which confounds our views of universal relationship, and prevents us from reasoning correctly of man and his destiny, of the universe and its machinery.

We dislike as much as any infidel in Christendom or Heathendom the cant of Sectarianism, or the use of the name of God, as an individual judge, or partizan, in the relationships of life; and it is not for the employment of the religious feeling in this exclusive and selfish, and belligerent style, that we insist upon the recognition of our fundamental fact. We seek it only as a fundamental basis of social organization, not only as a living type of fraternal unity, but an acknowledged source of individual comfort to the invisible mind in its hours of abstraction and dispensations of solitary retirement, when it rises up to the contemplation of the self-existent power, and forecasts its own individual destiny in the mighty ocean of being. The universal *acknowledgment* of a fact has a magic influence upon the mind—a universal *denial* of agreeable truth will depress the spirits of all but the strong-nerved and the independent few. To base a new world upon a *doubt* would only raise a superstructure of doubt. To base it upon a *denial* of Providence will break the spell of social enchantment. No amount of wealth—no possible improvement in the art of cookery, manufacturing, tailoring, dancing, or singing, would make amends for the want of this *non-essential*.

Now, according to our friend, the religion of the *New Moral World* is only "rationally conjectural." We are sorry for it. Ours is not conjectural. We know no fact more certain than the unity, wisdom, and power of the Great Agent of Nature. The fact that "man is the creature of circumstances" is not so plain, because we know many men who defy circumstances, who were taught to be religious, and became irreligious by contradiction—who were taught infidelity, and became Christians and zealous Missionaries by opposition. Still we allow the *general* truth of the proposition. But "circumstances" is a plural word. There is no unity in it. Why make the creating power a divided power, a collection of powers? Why make a *pantheon* for the mind, filled with an indefinite number of agents, all nameless, shapeless, senseless, and call this innumerable group of divinities, unknowing and unknown, the creators of man? Why not give them a *head*, and make *one* of them?

It is curious enough that the circumstances should be facts, but the uniting power of the circumstances only *conjectural*. Why so? We can see no reason for it. It does not appear to us to be one of those conclusive facts our friend alludes to. Neither does it so well, as our doctrine, accord with his own idea of necessity. The idea of a universal power, a designing, counselling, modelling power, enforces the idea of "necessity" on the mind. It was by dividing God into fractions that men got rid of "necessity." The devil is supposed to be independent. If so, he must be free, and all other free devils and free men become so many self-determining beings, who conceive evil independent of God, and in opposition to God. Those who believe such things are Sectarians. They are not Universalists; but, in believing such doctrines, they are in perfect har-

mony with the Polytheistic doctrine of circumstances, without a controlling mind, as the organizer of the universe. Let not the Editor of the *New Moral World* therefore be afraid of Providence interfering with free-will. It is only by forgetting Providence for a season that men can admit of free-will. A providential circumstance or thought is one in which the free-will is supposed to be overruled by a special interference. But a universal Providence denies special interference, for it is always acting, never slumbering, never sleeping, never forgetting the elaboration of its own great plans of wisdom.

If the fact of Providence be regarded as conjectural by our Social friends, we question very much if they will ever find a universal fact. They may find many little tee-totum facts about chemistry and dye-stuffs, acids and alkalis, spinning-jennies, and other such matters, which are very useful in their way, but come under the category of necessities, and have little relationship with that higher department of thought and feeling, which forms the centre of the contemplative principle in man, and from which proceeds all that is noble, all that posterity seizes with avidity and preserves with care. Even the doctrine of free-will, so keenly opposed by our Social friends, is one which the greatest portion of mankind rigidly holds. Why should the doctrine of necessity be less conjectural than the point we are disputing? It is equally abstract, equally immaterial, spiritual, mystical, inward. It is a purely mystical question, and not more susceptible of practical out-birth than the doctrine of Divine Providence, and the fact of revelation. Who is to be permitted to dictate upon this point? When is all the world to acknowledge that free-will is a phantasy, and that every thought, every act, every movement we make, is the result of a power which we cannot control by any self-determining, self-exciting energy? If the new social state cannot be established without this Calvinistic article of faith, it will probably be a thousand years and more before it have embraced the population of our own country. There are many other equally conjectural points which we might allege, and which, be it understood, we do not oppose. We are only levelling our friends to the position which they have deemed proper to select for us, by clothing us with the fairy robes of ideality and conjecture—and thence concluding that our views are non-essential. Now it is our firm belief that we are less, much less, conjectural and doubtful, and more demonstrative than they are.

Probably, the Editor of the *New Moral World* imagines, that because we have a religious feeling, that we must have a little sprinkling of illiberality. He says our "toleration far exceeds most of the other churches." Let us analyse this. We believe that God does every thing. Where can we find room for intolerance? It may be in our individual passions and feelings; but that we keep to ourselves; it is private. Intolerance cannot be in our doctrine. Our doctrine is social, and admits of any individual development which society, as a whole, thinks proper to permit, and that permission would be extended indefinitely to all thought and opinion, action only being amenable to political government. Now we know of no church which acknowledges the universality of Providence. There are many churches so liberally disposed as to admit the rights of conscience, as they are called, that is, the right of man to worship God as he pleases; but even the Dissenters, who claim this right, will tell the people, in the same breath, that Mahomet was an impostor; that the monk Sergius wrote the Koran. Call ye this tolerance? We deny that Mahomet was an impostor. We maintain his divine mission. We most cordially and rigidly believe he had the Koran given him verbatim, by revelation. Call ye this intolerance? But the infidels, who claim the same rights of conscience *politically*, carry their intolerance much farther, for they "dictate to others" the formidable article of liberal faith, that Moses, Christ, prophets, and apostles, were all impostors, cunning men, who manufactured the Bible, and made the people believe it. Call ye this tolerance? They have the tolerance outwardly, by claiming liberty to all to worship as they please! But where, pray, where is the inward tolerance? And where, pray, where can you find this inward tolerance taught, but in the *Shepherd*? And how, pray, how can it be received and cherished, but by those who receive the doctrines of the *Shepherd*? We know that our friends the

Owenites are far more liberal than the vulgar infidels in this respect. They get over the difficulty by their circumstances and necessity, but they cannot get over the *prophetic* profession, without either charging the prophet with imposture, or admitting the fact of his mission. They are thus in a dilemma of illiberality on the one hand, or the acknowledgment of our *fact* on the other.

Hoping we have given no offence, as we meant none, we conclude for the present.

THE INDIVIDUAL, THE UNIVERSAL, THE UNITY.

THE UNRIPE FRUIT, THE SUN, THE UNIVERSE.

Before introducing the following article from "An Old Mystic" to our readers, we beg merely to warn them of the language. It is written in the aphoristic style, and the language is very concise and mathematical. Every sentence is a text, and if the reader is unable or unwilling to preach inwardly to himself upon each text, he need not read, for his reading will be useless. It is the custom of common writers to think for their readers; the object of "An Old Mystic" is only to set the reader to think for himself. This we know; and although we are pretty sure that few, very few, of our readers will digest the aphorisms as they can and ought, still we are willing to risk giving insertion to the article, for the sake of the small minority. With the majority of the aphorisms we cordially agree, although it is more than probable, that, in agreeing with them, we set them to a tune not in perfect accord with that which our Correspondent plays upon them.

ALL external growth is gradual, and all maturity is the offspring of the *universal qualifying quality*.

Man's individual qualities must be contradictory, divisional and complex, till the universal quality becomes in them a uniting tendency.

Only so far as the *universal* quality enters into any, and every *individual* quality, is the individual quality pure, uniform, and simple.

In Christ we had all the treasures of wisdom and knowledge, which words mean the universal being, and to be looked upon as furnishing the pre-requisite to universally qualify the qualities in every individual activity.

Religion in its universality is qualitative, in its sociality it is quantitative.

Social happiness has its origin in man's universal being, and not in his external personality.

Man's outer being as an individual depends upon his inner being as universal, which he cannot give to himself, nor communicate to another.

No outward social state whatever can be to the individual in his individual character, what his universal being, character, or quality, is to him.

Man's social amelioration depends entirely upon his universal well-being, upon his inner universality, which is called the new man, or new world.

Man's social acts, as an individual being, are as unripe fruits, and need as much the universal maturity, or maturity, as the sour green apple needs the sun and the universe.

The old world, or old man, is the modal individual without. The new world, or new man, is the universal individual within.

Man's universal being would characterise all his individual sensations, if he would but wait on it to do so.

Man suffers as an individual, because he does not walk with his universal being.

If man assimilated his social policy to his universal being, he would relieve himself from a great measure of individual sufferings.

No quantity or quality of individual acquisition can be a substitute for man's universal being.

The more mature man's universal being becomes, the more certain he is in being consistent in his individual character.

Man, as a universal individual, must occupy a particular sta-

tion in the outward world, and in his individual character exhibits the traits of his universal being.

Man's well being, or good being, being of universal origin, it is proper, in all the exterior arrangements, to secure the same from any formal modal pressure.

The universal qualifying quality does to the individual qualities, as the gas light does to the coloured glasses.

The individual qualities are intirely modal, and confined to self, but as soon as the universal qualifying quality comes and embraces them, it extends their sphere.

Unless the *universal qualifying quality* pervades the individual qualities, the individual qualities are selfish, or socially selfish.

Individual qualities do not sustain the individual in all his modal conditions, but the universal quality is sufficient for him in every circumstance.

The individual man can do nothing with real advantage to himself without the universal qualifying quality.

While we direct the soul quantitatively, it must be miserable.

An immense quantity of wants would be cut off, if the soul were qualitatively instead of quantitatively directed.

No quantity can be that to the *soul* which the universal quality is; and the more it depends upon it, the more certain it is of all its supplies.

It must be the tendency of the universal quality to render all those whom it embraces independent of the influence of the affairs and institutions of the open world.

An individual that is not pushed on to the universal quality to be universalised by it, must remain in its limited modalities, and value these modes as intrinsic realities.

A universal individual does not enter into competitive connexions, and thus avoids crime, litigation, and all their consequences.

A universal being, being one with the antecedent unity, does not in the least depend upon particular quantities.

Provided the universal free quality be secured in the soul, it matters but little to the success of any exterior good what particular forms or institutions prevail.

A universal individual, be his modalities what they may, must be within itself a theocracy.

Where there is simplicity, uniformity, and purity, in exercise, the modal exhibitions cannot very long remain complicated.

The concentrative power of a universal being, when firmly expressed, must have always its full force, and reform the most defective modalities.

AN OLD MYSTIC.

ST. SIMONISM.

(Concluded from our last week's Number.)

UNIVERSAL ASSOCIATION IN THE FUTURE.

At this term of its progress humanity, which, by the complete knowledge of God and of man, has acquired a consciousness of the end towards which it moves, organizes itself in a definite manner, by constituting itself directly for progress, and consequently it is no more subject to the alternative of organic and critical epochs. Each individual, then, developed by an education tendered to all, is placed in association according to his capacity, and rewarded according to his works.

The object of human activity in this pacific association is the amelioration of man by man. The object of the material labour of human association is the cultivation (*exploitation*) and embellishment of the globe.

Religious dogma (in this new order) comprehends at once the material and the spiritual aspect, whose unity is *life, or love*. All the modes of human activity are sanctified. Man has found the true unity of God. He comprehends, he embraces this unity, which heretofore he had worshipped, known and practised, only partially and successively. Matter and spirit are no more accounted entities, or substances which can be separately manifested, but only abstractions, which the human mind makes to assist the understanding. The St. Simonian

God, then, is a living and loving God, manifesting himself at once materially and spiritually. He is a human, social, universal God. Under the influence of this conception of unity, of love, and of peace, antagonism completely disappears. Evil, the attribute of a finite being, which always develops itself progressively in God, disappears as a *positive* existence, and the dominion of evil is henceforth, for man, only the path opened for his progress. It is that which, for a little moment, exceeds his sympathies, escapes the foresight of his intelligence, and surpasses his physical energies; but never ought he to lose hope; for he has not to strive in the world against a hostile power. He enters not life under the weight of an original sin, which he must expiate by misery; in receiving the insatiable love of progress, he has also received the indefinite power of realizing it in practice. Prayer once supplanted imprecation; prayer now itself gives way to thanksgiving. The law of fear has disappeared. God has given himself to all entire, and all learn to love him, to know him, and to practise him. Nevertheless, mystery still exists for humanity, since man is a finite being; but, in the future, mystery will no longer present itself as a terrific thought; it will bear no more upon the destinies of man, which will be infallibly revealed by his desires and his hopes, but only on the manner in which these destinies can find an accomplishment in the bosom of God out of the circle in which he himself acts directly. In this association, wholly pacific, humanity labours only to develop the sympathies, to perfect the sciences, and to increase the mass of riches. Individuals classed and rewarded in the social hierarchy, according to their capacity, will be cultivated as much as possible by an education put within the reach of all. Capacity alone governs, and to an authority of faith and love there corresponds an obedience of faith and love. All labour for the happiness of each, and each for the happiness of all. The traces of slavery will be for ever effaced. The *SOCIAL INDIVIDUAL*, who heretofore has been man only, becomes *man and woman*. Every office is then filled by a *couple*; order and marriage are identical. Property is social. The entire field of production is cultivated by association, *hierarchically*.^{*} The ambition of each is to follow the progress of his superiors, and to elevate his inferior to himself. Such, in its most general aspect, is the new law given to the world by St. Simon.

To ALL men, without exception, but to every man according to his capacity and his works, education, employment, repose! The triple direction of humanity in LOVE indicates in society three orders of labour—*INTELLIGENCE, DOGMA or Science; RELIGION or Politics;† POWER, Worship or Industry*. The social hierarchy is therefore composed of *Learned Men or Theoricians, Priests or Governors, Working Men or Practicians*.

1. *LEARNED MEN, or THEORICIANS*.—The *savant*, or man of science, is the man whose sympathies are directed principally towards the contemplation of the intelligence, the wisdom, the order, which preside over the production of phenomena, their connexion, their succession. The object of his activity is to penetrate more and more the knowledge of the laws, which operate, and link the different phenomena of life, in man or in the external world. Now, as every phenomenon is in God, or is a manifestation of God, it follows that science, in all that it comprehends, is only the knowledge of God himself, and that in this sense it may be denominated

Theology, or Dogma.—Scientific labour has for its object to multiply discoveries and disseminate knowledge as widely as possible, which gives occasion for the first general division of this labour into the *Perfecting of Theories, and the Teaching of Theories*, a division to which correspond two distinct orders of savans.

Theories having for their object to throw light upon practice,

^{*} This *hierarchy* means only a system in which *mind, or spirit*, governs, and not wealth or hereditary rank. Except in the Jewish Church, priesthood has never been hereditary, but it has been corrupted by hereditary patrons, who have secured its benefices.—E. S.

[†] In order to throw some light upon this St. Simonian identification of Religion and Politics, we may observe that Religion means union—Politics, the *material aspect of religion*.

and obliged, of consequence, in the double labour which they comprise, to draw their inspiration from practical wants, it follows that those who perfect and those who teach theories, ought to keep up an uninterrupted intercourse with the working classes. It is the *Social Priest* who establishes this intercourse, this bond of union, by means of the

Priest, or Governor of Science,—he who loves and conceives the destiny of humanity principally under the aspect of its *intellectual* amelioration, and whose function is to reconcile and unite those who are entrusted with the perfecting of theories and those who are entrusted with the teaching of theories, so as to direct the work of elaboration according to the wants of instruction, and to keep instruction on a level with discovery and invention.

2. **PRIESTS, or GOVERNORS.**—The priest is the man in whom reigns the love of the progressive destiny of humanity, in whatsoever order of fact it proceeds: and who derives from this love the light and the vigour necessary to direct its efforts towards the end that he loves and desires.

It is, therefore, the priest who governs; wherever there are efforts to combine, men to unite, the priest necessarily intervenes. His function, expressed in the most general manner, is to **UNITE, to ASSOCIATE.**

The Social Priest—embraces, in his love, all the modes of being, of humanity. Whatever be the extent of the sphere in which he is placed, it is from him that all social activity emanates; he is the source and the sanction of order, the foundation and the bond of the hierarchy. He presides over education, he decerns employment and repose, adjudging to each the department of *LOVE, of influence, of wealth*, to which his *CAPACITY* is entitled, and which his works deserve.

The duty of the Social Priest may be summed up in the task of harmonizing, in so far as human *DESTINATION* is concerned, the labours of science and of industry; and **UNITING, ASSOCIATING, politically**, the men of science and the working classes, for the attainment of this destination.

The instrument by which the priest accomplishes this end is

EDUCATION, in the most general sense of the word, has for its object to direct each generation to its religious and social destination. Education extends to the whole life of man, whether it be to recal the first impressions which he has received, or whether it be to strengthen and develop them within him. It is by education that he learns to *know*, and acquires the power to *perform*, what he *ought* to do. Education is therefore the first and the strongest security of the social state. It forms also the most important standard of religious and political authority. Education divides itself into two branches.

Education, Moral or General.—General education is destined to give to all men indiscriminately, taking for a basis that which they have in common, the sentiments, the knowledge, the physical habits which permit them to live in society, whatsoever may be in other respects the different directions in which they may be engaged.

The two chief means of moral education are—

Preaching or Lecturing, is instruction given to men assembled. Under this form precepts are given to all by means of sensibilities and intelligences.

Confession is the familiar instruction given to each individual. Under this form precepts are applied to each individual case, and instruction appropriated to each sensibility and each intelligence.

PROFESSIONAL or SPECIAL EDUCATION has for its object, in taking for its basis the differences which distinguish men, to appropriate them under the triple aspect of sentiments, knowledge, and physical habits, to the different functions assigned to their different capacities, but more particularly to the social relations which they ought to have with those with whom they are called to associate in labour.

Special instruction may be considered under two points of view, *Theory and Practice*.

Theory has, for its object, to perfect without interruption, the processes and methods of communication.

Practice consists in applying the methods and processes of

communication to the different natures of instruction corresponding to the different orders of labour.

3. **WORKING MEN or PRACTICIANS.**—The working man is he whose sympathies are principally excited by the *spectacle* of beauty, power, fecundity, which display themselves in man and in the external world. The object of his activity is to appropriate the productive powers of the earth to the material wants of man, and also to employ the creative powers of man to the embellishment of the earth. Now, as it is in God himself that the action is exercised, which modifies, transforms, creates, it follows, that industry is, properly speaking, the *PRACTICE* of God, and that, in this sense, it may be called

Theurgy, or Worship.—Industrial labour has for its object to multiply riches, and to distribute them with the greatest possible rapidity, according to the division which ought to be made of them, which gives occasion to a primary general division of this labour into the *production* of wealth, and the *distribution* of wealth—a division to which correspond two distinct classes of workmen.

As industry ought to be a direct application of scientific theories, and as it therefore ought, in the double labour which it embraces, draw its inspiration from the progress of science, and clothe itself with them to supply its own wants, it follows that the working classes, producers or distributors, ought to be, without ceasing, in communication with the *Savans*. It is the social priest who establishes this communication—this bond, by the mediation of

The Priest, or Governor of Industry.—He who loves and conceives the destination of humanity under the aspect of its material amelioration, and whose duty it is to harmonize and unite the workmen who produce riches, and the workmen who distribute riches, so as to direct the labour of production according to the wants of consumption, and to regulate consumption according to the resources of production.

LEGISLATION prescribes that which education had for its object to cause to be desired—That which characterizes it is the penal or remunerative sanction which is attached to its prescriptions. It is therefore only a means of secondary order, since it intervenes in some respects to supply the defects of education. However, it is an indispensable complement of education. In the future, every law is the declaration by which he who presides over a function, or any other species of social relation, makes known his will to his inferiors, sanctioning his prescriptions by rewards and punishments.

Every judgment is the act by which the superior punishes or recompenses his inferior, in the order of labours or relations which he superintends. Therefore, the law is a *living law*, for the law is man. It is always real and precise, for it is always related to a fixed condition; and the legislator is always the man who is best qualified to appreciate that which belongs to the condition over which he presides. The judgment is always equitable, for the judge is at once he who loves, and he who best understands the order which it is his object to maintain, and the individual whom he judges.

The priest has for an agent in the performance of his duty—

THE ARTIST.—The mission of the artist is to develop and excite the sympathies of humanity; the artist is the *word* and the *action* of the priest. It is by the artist that the priest manifests himself. The artist seizes the thought of the priest; he translates it into his language, and incarnating it under all the forms with which he can clothe it, he renders it sensible to all. He reflects in it the world which the priest has created or discovered. He reduces it into a *symbol*. He unveils it to all eyes.

The three principal forms of Art have relation to—

Dogma, or Doctrine, by means of poetry, song, symphony—to *Religion*, by means of preaching, the drama, and ritual—to *Worship*, by means of painting, architecture, sculpture.

RELIGION, therefore, embraces society in its totality. Its mission is to unite theory and practice, science and industry, doctrine and worship. The religion of the future will be greater and more powerful than any of the religions of the past. It will consummate them all. Its doctrine will be the synthesis of all the conceptions, of all the modes of human being.

The religious doctrine of the future, or the definite and complete conception of God, will be at once

Pantheism, because God is all, and all is in God;

Monotheism, because all the facts will be attributed to the same will, and referred to the same end;

Polytheism, because God the one multiplies himself under every form, and characterizes himself differently by the different orders of phenomena which Nature and humanity present;

Fetichism, because God individualizes himself in each of his manifestations, and perpetuates himself in them.

But the religious doctrine of the future will not be,

The *Pantheism* of the past, because the universal God will be living and loving; and because individuality, instead of being engulfed and annihilated in God, will in him progressively develop itself; nor

The *Monotheism* of the past; because the one God will be universal, and no existence will be conceived out of his bosom; nor

The *Polytheism* of the past, because the multiplied God will be one God; nor

The *Fetichism* of the past, because the individual God will be only a manifestation of the one universal and absolute God.

The government or politics—the social realization of the doctrine of the future, will be at once

A *Theocracy*, because the governors will be priests, and humanity will be organized under the influence of a doctrine which will sanctify all the modes of its activity, and give a religious character to all its social and individual acts;

A *Monarchy*, because one power will be reflected in all the departments of society;

An *Aristocracy*, because power will be given to the most worthy, by the most worthy;

A *Democracy*, because each, without distinction of birth, will attain to power when he is worthy of it, and because power will be employed for the interest of all.

But the government of the future will not be

The *Theocracy* of the past, because it will promote progress and not immobility, and because the hierarchy, founded heretofore on *castes*, will henceforth be based on the native capacity of each individual; nor

The *Monarchy* of the past, because, instead of being hereditary, or even for life, the power entrusted to the most capable will remain in their hands only during the time in which their energy will permit them to exercise it for progress; nor

The *Aristocracy* of the past, because it will be neither hereditary, nor military, nor indolent, because it will not oppress the people, and will always be the reward of *zeal*, of *science*, and of *labour*; nor

The *Democracy* of the past, because the *people* will no more form a distinct class in society, because each labourer will have rights as a member of association; and because society will suffer itself to be directed in *love* by men the most capable and the most devoted to its interests.

IRRELIGION takes place when man has ceased in contemplating the universe and his own existence, to perceive in it order, harmony, unity. But by a law of its nature, humanity, so soon as a doctrine no longer corresponds to its wants, tends inevitably to a new conception of order, and the moment it apprehends it, it returns to religion. Order, harmony, unity, are now new revelations; and in this order, this harmony, this unity (*ensemble*) it recognises the life, the feeling, the will of the INFINITE UNIVERSAL BEING, that it has always sought, and always successively conceived; whom St. Simon has at last discovered, and in whom it finds the complete and definite revelation of GOD.

[This concludes the chart of St. Simonism, with the exception of a note upon the word "*Priest*," which we will give next week.]

GLASGOW COTTON SPINNERS.

[HAVING inserted the accusatory speech of Sheriff Alison in a former number, we now present our readers with an address of the Glasgow Cotton Spinners in reply; but, as we have not

yet read Mr. Wakley's defence of the convicts and the association, we shall say little more at present than merely express our belief, from a conversation we had with one of the delegates, that much injurious slander has been circulated respecting the association, and great injustice done to the members thereof, by withholding from the public press, both in London and Scotland, the report of the defence. If secrecy has been employed by the working men to accomplish their own ends, secrecy has also been employed by their enemies to prejudice the minds of the public, and this secrecy, this withholding of evidence, this close trial of the representatives of the people, bodes no good in the motives of their opponents, and tells as a very suspicious circumstance in the history of the affair. Time, we hope, will unriddle the mystery, but government will gain more by mercy than by judgment. The hearts of rulers are often satiated by Providence to accomplish their downfall. He has two modes of carrying on the progress of society—*kindness and cruelty*. He is the *heart hardener*, but when he hardens a heart he gives it an *enemy*.]

(From the *Glasgow New Liberator*.)

ADDRESS OF THE GLASGOW COTTON SPINNERS TO THE INHABITANTS OF GREAT BRITAIN AND IRELAND.

At the Circuit Court of Justiciary, held in Glasgow, on the 12th of January, 1838, Archibald Alison, Esq., Sheriff of Lanarkshire, found it convenient (in replying to the judges) to attack the Glasgow cotton-spinners in the most insulting and unqualified terms, intermixing his statements with language the most false, expressions the most degrading, attributing to them practices and conduct the most revolting and destructive to the well-being of civil and social society, and then encircles all with the mantle of sophistry and falsehood. The most active and efficient means have been taken by the mill owners and others interested, in circulating Mr. Alison's address among the working population, for the purpose of destroying and tearing asunder the last links of union and social existence among that sadly abused class of workmen, the cotton spinners of Glasgow; therefore, they consider themselves bound to lay before the world a statement of facts incontrovertible by revengeful and interested factions, as they are true in their character.

When the cotton spinners struck work in April, 1837, it was not for the purpose of forcing up their wages by violence and combination, as alleged by Mr. Alison, it was the combination of capitalists, who, on Saturday, told the workmen that if they would not submit to a reduction of 15s on their wages, they (the operatives) were to go about their business on Monday morning. Thus, then, the masters compelled their workmen to strike without giving them time to inquire into the cause; but an inquiry was entered into, although on strike, the result of which was, that all yarns below No. 100 were realizing as high a price in the market as similar No.'s had done in previous years, when the masters were paying as high a rate of wages. When the spinners found that the commercial relations of the country were becoming more and more distracted by the venal practices of fictitious capitalists, they instantly yielded to the masters' proposition. But the proud and haughty members of the masters' combination turned round and said, no, we will not have you, except you agree to work at whatever we propose, and that is a reduction of 35 per cent., or upwards of one-third of your wages. Here, then, the masters combined and conspired against the workmen; brought into operation all their influence in raising the voice of public opinion against them; they forced the men to the street, and used their united efforts to starve them into submission. And this is what Mr. Alison calls "*the insane attempt which tripled their distress*," although he knew well that every attempt was made on the part of the spinners to bring about a reconciliation between the contending parties without effect. An unqualified surrender to become the willing serfs, and bend the neck to those very men who had built their fame, and their lordly palaces upon the sweat and blood of the cotton spinners of Glasgow, to become the miserable puppets of a cotton-ocracy, that their political existence should be blotted out of the book of time; these were the conditions upon which the ringleaders of the masters' combination would treat with the men they had combined against.

Although we had often declared to the world, and stated to the masters, that should they open up channels in the yarn market, through which information could be obtained at given periods as to its real state, and the masters to raise the wages in proportion as they wish to reduce them, no disputes would ever exist; but no, this being contrary to their secret and exclusive system of dealing. Yet Mr. Alison, in his Christian-like spirit, surrounds the name of cotton spinners with the hallowed breathings of the *Christian* and the philanthropist. Conspirators, fire-raisers, assassins, are common epithets on the lips of the highest civil functionary in the country, when speaking of spinners, when it is evident that the conduct, and exclusive practices of the employers, smacks as much of secret conspiracy as the operatives. Look at their conduct these twenty years back. Has it not been one continued chain of combined operations to reduce the spinners' wages whenever an opportunity occurred, or the smallest pretext offered itself? Is this not a conspiracy to reduce wages, which ought to be as criminal in the eye of the law as a conspiracy to keep up wages, of which the immaculate judgment of a Scotch jury found the five victims of a horrid and cruel persecution guilty? We have already said that the masters were the real, original, and only cause of the strike of 1837, which has produced such appalling and dreadful results, as Mr. Alison admits. Why then were the five spinners banished their native home, for the hundreds of girls and boys, women, and men, who happened to be on the streets of Glasgow? And if the secret and exclusive practices of the employers had the effect of producing and creating strikes and disturbances, why was the strong arm of the law wielded with such potency over the devoted heads of the cotton spinners, for walking the streets in peaceful procession? These are the three charges found against our unfortunate brethren. First, conspiring to keep up wages; the masters conspired to keep down wages. Second, great numbers of people assembled at Mile-end during strike; the masters were the cause of the strike. Third, the spinners walked in peaceful procession through the streets of Glasgow; the masters by an exclusive system dealing, prevented the spinners from participating in the peaceful enjoyment of their labour. If both parties were equally guilty, why did both not meet the same reward? If it can be proven that the conspiracy for keeping up wages was created by a conspiracy to reduce wages, why did not the conspirators meet the same fate of our unfortunate brethren? No, no, this is altogether contrary to the judicial proceedings of Scottish courts; the poor must toil and sweat, produce all, pay all, support all, bear all the reproach of those who should protect them, and after all be banished their native land for the actions of those who have built their temples of wealth, fame, and popularity, upon the blood and vitals of the degraded, persecuted, and banished workman, proving to a demonstration that there is one law for the rich, and another for the poor; that the unbalanced, unwarrantable, and villainous machinations of the greedy capitalists must and will be protected and encouraged by the strong arm of the law; while the poor man will be trampled to the earth if he wishes to live.

Mr. Alison goes on rejoicing to think that *all the acts of assassination and fire-raising by which terror has so long spread itself through the West of Scotland, has been traced to their real source*, referring to the trial at Edinburgh, and identifying the cotton spinners with all these acts of fire raising and assassination. Well, what did they prove at Edinburgh? Only what is already stated in this paper—only what cotton spinners would acknowledge at any time—only what was admitted by the witnesses in exculpation in the witness box, and this only from a positive conviction that the conduct and practice of the members of the association, in a joint capacity, would at all times be under the protection of the provisions made in the various acts of parliament which bear upon the subject. Was the fire-raising proven to be created by the dictation of the cotton-spinners' association, because a great number of people were seen at Mile-end? Were the assassinations proven to be an act of the spinners' committee, because it compelled the spinners to strike work? And has the arm of justice been paralyzed in this country for the last twenty years, because some spinners took the liberty of taking a walk through

the public streets in broad day, without disturbing either person or property? Surely, surely there is not a man whose mind is regulated by the ordinary oscillations of judgment and common sense, who will admit such a preposterous conclusion. But, perhaps, Mr. Alison refers to another source, when he says *its misdeeds are completely brought to light*; the light he refers to will be from the light of astronomy; the discovery of Moat, Murdoch, Christie, Thorburn, Cowan, and others of less note, must ever be considered a discovery of the first magnitude. The bright and the shining light which these new planets will, and have thrown upon the moral world, must far eclipse the light which the orbs of the solar system can throw upon the material world. Yes, the key of gold used by the nimble fingers of the law, can open the secret chambers of the human heart, and make its rays to shine in whatever direction the golden reflection directs, and, basilisk-like, leaves its venomous and destroying impression on whatever objects its malignancy fixes upon. The planet Moat, shows all that is useful for certain purposes at present, which happened when moving among the lower orbs, but kept hid what itself proposed; never throws any light upon a working committee, an efficient committee, a committee that would be independent of the supply committee; yes, a committee that would be responsible only to itself for its actions; this Moat insisted on at a public meeting, but was scornfully rejected by the trade; then, traitor-like, he endeavoured to fix the base impressions of his own villany on the innocent. And because the planet Christie can show that gloves, yes, black gloves can be borrowed and returned without knowing the purpose; and that these gloves can be made yellow for perverting justice and making the innocent guilty. And Murdoch, a planet whose splendour is such, that as he is of no use to himself, he of necessity must make innocents be participators in his blazoning rascality. Is this a specimen of the proof which has led to such a glorious conclusion of Mr. Sheriff Alison? But the world knows that the golden seal of civil necromancy can reach the darkest recesses of the human heart; hence the imprisonment, the written evidence, the mature plots created by this great discovery of those planets by Mr. Alison. But those planets have lost their splendour; their plots were discovered; innocence has prevailed. A conviction has been carried upon charges which at all times were beside ed legal, and are considered legal in every country where justice prevails; but, alas! not in Scotland.

Mr. Alison speaks in the highest terms in praise of the *intrepid* and undaunted courage of his friend, Captain Miller; he entered the Blackboy Tavern when it was full of conspirators, and apprehended fifteen of the conspirators without a blow being struck. Well, the facts stand thus: during the day that the cotton spinners' committee were apprehended, they learned that such was to take place; but conscious innocence told them not to flinch. Between nine and ten o'clock forty-nine police sergeants, headed by the Procurator Fiscal, a messenger-at-arms, Captain Miller, and all headed by Mr. Alison himself, entered; it can be proved to this hour that only thirteen spinners were in the house at the time, and twelve out of the thirteen were apprehended without a murmur or a blow, as stated by Mr. Alison. So much for the veracity of Alison; so much for the daring intrepidity of Captain Miller! Who can dare to disprove this statement?

Mr. Alison speaks of the great loss sustained by the public from the strikes of the operatives, the great loss sustained by the operatives themselves, the distracting effects produced upon the mercantile relations of the country, and the probability of the continental powers grasping at our commerce. All impartial and judicious thinking men will attribute those threatened calamities to the competing and grasping spirit of factious capitalists—yes, attribute them to the original cause, the secret and combined operations of the masters to reduce and grind down the workman's wages, and thus reduce the value of their own capital, gathered when workmen's wages were high. If this spirit of grasping tyranny is long persevered in, the British labourer will be compelled to connect his skill and industry to the growing enterprise of the continental capitalists, who, with their easy taxes and trifling debt, will supplant Britain in her boasted glory, and leave her a baseless monument of her former

greatness—a prey and a curse to her bad laws, her base and profligate customs, her heartless and cheerless tyranny, and her venal and blood-thirsty governors.

It cannot be expected that a poor degraded cotton spinner can cover his language with that elegance of sophisticated learning, which the highest dignitary of the county can command; but although cotton spinners are degraded and persecuted, yet they can tell this to the world, and defy contradiction—they can speak truth, and be regulated by its virtues—they can ask their rights, and fearlessly meet the consequences. Let the world say of them what it will, they are still honest cotton-spinners.

PETER FERGUSON, CHAIRMAN.

MYSTICISM AND SELF-CONCEIT.

THAT we may not be open to the charge of neglecting good advice, or of avoiding instructive questions, it is our duty to recur to No. 27 of the *Shepherd*, page 216, where will be found the following sentences—

“Jesus Christ said, ‘tell no man who I, the son of man, am.’ Be not your own trumpeter. Let your actions speak, and your words testify. Has he (the Mystic) himself, got this new or additional nature? and what is its fruit? and how is it distinguished from self-conceit?”

Self-conceit, or self-conception, in the natural corporeal world, is exactly nothing at all. Self-conceit, or self-conception, in the mental world, is very little more. It is, at best, an unsubstantial vapour, scarcely capable even of agitating the nerves of the conceiver, much less of disturbing the philosophical observer's equanimity.

A virginal conception in the sphere of body, and a virginal conceit in the sphere of mind, differ very little in real value. The unmarried women will discourse a long while together, whether motherhood be anything or nothing, whether it result from self-conceit, or in what other manner, before they thereby arrive at any real knowledge of the subject. They may, to the mother, deny the mother's facts, but that will not reduce such facts to the level of their own scientific disquisitions.

The additional mother nature is then readily distinguished by the mother from self-conceit, and she will care nothing about the disputes, whether it be something or nothing. If her actions do not speak, nor her words testify in a manner sufficiently demonstratively for the bye-standers, it can make no difference to her real being. It can, indeed, make a difference with respect to the estimation in which she is held by her neighbours, but such considerations are absorbed in the fulfilment of the mother's duty.

The observations and interrogatories of the *Shepherd* are put together so much after the pulpit fashion, where questions are freely and abundantly asked, which are never intended or allowed to be answered, that it is not clear whether such was his intention. He requires that we should not be our own trumpeter, yet he wants us to declare our distinctive characteristic, well knowing that the egotism, if not the imagination of man, will prompt him to produce a highly coloured representation of his idea. After all, it would remain to be substantiated on better ground than paper and print, whether the description were borne out or not by the being and life of the individual.

Any one can, from the Scriptures, or from some other book, or albeit from himself, form the heroic idea; and afterwards make a large apology for his own frailties if he falls short of the measure wherewith he says we should be meted out. From this might arise an endless and a valueless controversy, leaving the subject where it found it. The *Shepherd* appears to have had in his mind some such connexion between Jesus Christ and the mystic character, when he penned this advice. An allusion, if so, more complimentary and dangerous than judicious. At least, the two parties are brought into intensely close contact. I will not say such lofty example is above the mystic's hope; on the contrary, that example was made on purpose for man's elevation and realization, not for his imitation in the ordinary external sense.

Perhaps the utmost good that men can do for and to each other, is to point out their respective errors. To administer the

truth is not in the human province. The greatest and most fatal error is the almost universal fallacious supposition, that it is the business and duty of man to contend for the truth. I should say, that truth is stronger than man, and must be his supporter. Hence, it is to be replied to the question, “Has the mystic got this new nature?” that man does not get this new nature in either the sense of begetting, or going somewhere to obtain it, or making it. Man does not at all get the new nature: the new nature alluded to gets him. The new nature is larger and more vivid than man, whom it comprehends and animates.

“What are the fruits of the new nature?” Here, again, it would not be difficult to make an egotistical picture of a supposed state of being. If one should say that the fruits of the new added nature are the new added joys, satisfactions, and delights which are independent of all external circumstances whatever, the reply would be placed to the motive of covering disappointment with large words, or making a screen to hide nothing, or a demonstration of the fact would be demanded.

But even should the baby be now dead, and the mother have no outward and tangible concretion to offer, the inward and real facts are no less clear and true to herself.

This kind of answer will enable the *Shepherd* to exult over the admitted selfishness of mysticism. After all then, he will say, it is for the sake of their own happiness that the mystics adopt this inward turning. But he must not conclude too rapidly. He well knows that happiness sought is never happiness found; that the servant must willingly do the work first, and wait patiently for the reward to follow; and if he works for the reward, and not for the master, the master who knows it will not give him the reward.

It is difficult to satisfy the unwilling and opposite mind on this point of selfishness. If one should declare against the lower gratifications, it is insinuated that it is from a regard to higher pleasures. If one denies the right of man to seek pleasure of any sort, that is booked to asceticism and morbid gloominess. One always strikes too high or too low.

If I should say that “the new nature is distinguished from self-conceit” in that, while self-conceit worries and plagues the self-conceiver and all within his sphere, the new nature chastises only self-conceit; and that having accomplished so much self-punishment, the new nature has little further progress to make to complete the mystic character, I should be open to the reproach of explaining mysticism by mysticism. Yet I know of no other mode. Mathematics can only be explained mathematically; the mechanist can only expound his work mechanically. To every one it is allowed freely to stand on his own ground, except the mystic, and he is to take ice to the tropics. When it turns out water he is to have it thrust in his teeth, that there never was and never can be any solidity in it. And when he goes still deeper to assert, that the solidifying principle and power reside in something more fluid than the water, nay, actually invisible and most subtle, shall he not be condemned as attempting to outrage the most obvious common sense? Who will believe in the power of the gaseous to master the solids?

A controversy in written words is not so valuable as the actual collision of mind and mind. But we must accept what is offered, till the desire for something better grows stronger. These replies are not offered on the ground of satisfying the *Shepherd* or his coinciding readers. None that could be given would probably satisfy his mind at present. It will, however, do no harm for him to ask more questions, and no one can be more ready at all times for a respectful rejoinder than is

A MYSTIC.

[We will ask no more questions. We thought we would get a lawyer's answer. We were entitled to one more definite, if a more definite could be given; but as the subject of discourse is a mere individual feeling, it is wisdom to say as little as possible promissively about it. Individual feelings can never be compared. It is a piece of presumption in any man, to assert that his feelings are more agreeable than ours. The subject is beyond the sphere of reason, and consequently of writing. Of this we believe our readers now feel convinced. Poetry is the proper vent for the pure mystic inspiration.]

DR. ARNOTT'S NEW MODE OF HEATING ROOMS.

DR. ARNOTT has invented a stove which is likely to supersede the present uncomfortable mode of heating apartments by large grates, and smoke conduits. Its superior advantages are contained in the following short summary, and it seems to us to be a worthy rival of the Jerusalem Coffee-house method, the secret of which is not yet revealed. Dr. Arnot, like a true patriot, makes a gift of his to the public.

"Economy of fuel.—A common open fire wastes seven-eighths of the heat produced. This stove saves or puts to use very nearly the whole, because, first, it does not allow the air which has fed the combustion to escape, until deprived of nearly all the heat; and secondly, it does not allow any of the warm air of the room, except the little which feeds the fire, to escape through the chimney.

"Uniform temperature in all parts of the room, and throughout the day. There is no scorching on one side, and freezing on the other, as often with a common fire.—There can be no draughts in the room, nor layer of cold air on the floor.

"The Stove is always alight.—This peculiarity, next to the saving of fuel, if not even before it, may be deemed a leading characteristic or advantage of the stove, from which many minor advantages flow. Its importance is perceived by reflecting on the disadvantages of common interrupted fires, as—the trouble and expense, with smoke, dust, and noise, of lighting the fire, &c.

"It is because the stove is ever alight, that the temperature of the place warmed by it is so uniform, and that so much fuel is saved. More fuel would be wasted in one morning hour, by the attempt suddenly to raise the temperature of a room which had become cold in the night, than by keeping the fire burning moderately all the night.

"No smoke can come from it, for the only passage is the small opening by which air enters to feed the fire, and in this, if desired, there may be a flap or valve, allowing air to enter freely, but not to return.

"Obedience to command.—The screw of the regulator as certainly increases or diminishes the temperature, as the screw of a lamp varies the light; and by having a thermometer accurately made and graduated, the very degree of heat required in any art—as in enamel painting, &c.—can be obtained with certainty."

TO CORRESPONDENTS.

We mean to conclude the third volume of the Shepherd at No. 40. The work will then be complete. A copious index will be given to the 2nd and 3rd volumes, and a title page to each. No correspondents' letters can be inserted in No. 40. We make this early intimation, that our regular correspondents may have time to draw their thoughts together, and string their beads. We have come to this resolution because it is our intention, at the end of the summer season, to recommence lecturing on the topics of which the Shepherd has treated, and before that we wish not only to have a little release, but to visit our movement neighbours in France, for the purpose of engraving either from without by observation, or from within by letting the spirit operate, some clearer conceptions of universal subjects on the root of Universalism, which the creating mind has already planted. We mean to open our lectures to all that thirst after the word, without money and without price, and to make them a species of school for inquiry and reflection, rather than an institution for dogmatical instruction. Hitherto we have been obliged to charge admission-money to clear our own expenses. This had a mercenary look, which we did not admire, but could not remedy. The mercenary look we hope now to remove, and, as a free gift, to scatter the seeds of the universal word amongst the indiscriminate vulgus humanum. We hope to be succeeded by many more labourers in the same cause, and on the same principles.

W. Barber's communication was very acceptable, and his friendly rebuke by no means offensive. We hope by this time he is partly reconciled; by calling on Monday at our publisher's he will find a paper left for his perusal, which we request him to return in a few days; it will, perhaps, communicate a few ideas, and enable him more clearly to appreciate

our motives. We are not so one-sided as he imagines. In fact, one of the greatest difficulties we have to encounter, and one of the strongest objections urged against our doctrines, is the tendency to two-sidedness, by which we perceive that even a bad man is not all a devil, nor a good man all a saint. Our opponents say it produces tameness. This they consider a fault in a doctrine, but not in a bear or a bull-dog. Tameness is the spirit of peace. We heartily wish that men were tame. We shall see very little peace on earth, and good-will to men, till the tameness begin to reign both in doctrine and practice.

Francis Wilby.—We are sorry we cannot insert a series of letters on the Pestalozzian system; but if our Correspondent can draw up a concise synopsis, somewhat in the style of the St. Simonian synopsis, in our present number, we shall be very much obliged to him, and will with pleasure insert it. But it must be short and concise, with no circumlocution.

An Ultra-Mystic, and W.—These two gentlemen, perhaps one, although the pens are different, have each a song in our possession on the mirth-exciting subject of Mysticism. W. seems to think that an Ultra does not go far enough, and even questions his sincerity, and makes his bow, and introduces himself as a genuine Spiritualist, with a material base. With all due respect for the talent of these two gentlemen, but with a little doubt as to the propriety of keeping up the crusade in that particular style, we decline the insertion of the two songs which they have submitted to our editorial judgment; but, should they feel disposed to attempt a matrimonial union of the spirit and the flesh in a jovial Pansymphatic (not saucepan) cantata, we should be very proud of the warble, and perhaps get it set to music for the Pan-Harmonicon.

W.'s letter anent the Cotton Spinners' case, will probably receive a satisfactory answer in a week or two. We admit that we deserve a gentle rebuke, but it is a very difficult thing so to separate the good and the evil of a cause as to satisfy the reader of the justice of our motives. Wherever the feelings are strongly excited nothing but keen partisanship will satisfy, and that in any but a universal cause we cannot feel. But we consider the local association and "strike" system as a sort of ordeal through which the people require to pass in order to conceive the idea, and attempt the practice of universal association, in which alone there is any hope. The word universal can never be too frequently uttered in their hearing. It is for this word chiefly that we like the Radical doctrine of universal suffrage, although the mere suffrage is in itself a nullity, unless there be some positive universal idea, end, theory, object, or measure, for which the suffrage is to be employed. There is more difficulty in obtaining the latter than the former. The Americans have obtained the suffrage, but they cannot find the universal idea to suffrage about. Their suffrage, therefore, is of little use to them. They owe more to their youth and their position. The universal idea is, in our estimation, the spirit of which universal suffrage is merely the body, and as the body without the spirit is dead, so universal suffrage without the universal idea is dead also. These local associations are far from this universal idea; for this reason they produce only civil war, and the desolation they effect is similar to that of a battle fought on the spot, in which the fields are trodden down, and the villages set on fire, and the inhabitants taxed to pay the combatants, and all that can be said of it after all is this, "it was a famous victory." We have not taken the part of the masters. Was it not one of the rules of the association to reject all apprentices but the children of spinners? Policy might justify this as retaliation, but the adoption of such a measure is the introduction of a new popular law, which, instead of progressing to liberty, is retreating to tyranny and exclusiveness.

Transcendentalist.—We were so late in receiving his letter, which he promised some time ago to send a day earlier, that we were obliged to reserve it for next week.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 35, Vol. III.]

SATURDAY, FEBRUARY 24, 1838.

[PRICE 1½d.]

UNIVERSAL PROVIDENCE THE BASIS OF A SOCIAL RELIGION.

"All are but parts of one stupendous whole."—*Pope.*

"Spiritus intus alit, totaque infusa per artus
Mens agitat molem, et magno se corpore miscet."

Virgil. En. l. 6.

LAST week we laid down the title of this chapter as an axiom, and this week we do not mean to depart from our axiomatic principle. Regarding the proposition as *the first and universal fact with which all philosophy must set out, or to which it must inevitably tend, and out of which it can find no rest*; we mean rather to make a short analysis of the fact, and show how it embraces all knowledge, and gives birth to all that is valuable in politics, science, and morals.

There is a decided advantage possessed by the system, which begins and ends with universal unity. That system we pursue, and, in endeavouring to describe it, we first analyse the *one fact* into its great component parts, and afterwards synthetically put the parts together into unity again, thus making an analytical synopsis of universalism.

Regarding universal being as a unity, every individual part must be under a law of necessity. We all exist in the whole, and are subject to the laws of universal being. Whatever freedom we may possess, or think we possess, is limited to the laws which the universal power has imposed upon us. Man is subject to the law of man, vegetable to the law of vegetable, and beast to the law of beast. The man of talent is subject to the law of his talent; and the capricious temper must yield to a certain extent to the law of caprice. Even admitting, therefore, liberty to a moderate extent, this moderate extent can at the utmost amount to a self-direction under the influence of an irresistible necessity. Necessity is therefore the law, and liberty only the undefinable exception, which never can amount to a repeal of the law.

The great and all-absorbing fact of nature, therefore, is the universal cause, the only original cause which Shelley calls Necessity, and which some prose writers, in imitation of him, or the philosophers of his school, have adopted as their God. Necessity no doubt is God; for God is all and in all; and is necessity as well as any other attribute of Nature. But there are three kinds of necessity—physical, intellectual, and moral. God is physical necessity, or the eternal power of matter. God is intellectual necessity, or Omniscience; that is, perfect wisdom which of necessity does that which is wise; and God is moral necessity, which necessarily does that which is just and good absolutely. Necessity thus explained, includes every possible idea of God; but being a word, which vulgarly conveys the idea of death and unconsciousness, it never can be substituted instead of God. A philosophic mind would perhaps not object to it, because the philosophic mind is elevated above the little prejudices of the vulgar; and, by its own imaginative definitions, it can clothe the most offensive or imperfect terms in the attributes which are most congenial to its own conceptions of truth. But the same mind that could array the name of necessity in the attributes of deity, could also find an equally satisfactory

definition of any other abstract term, as the name of the Supreme. Power, truth, love, God, Christ, Satan, Baal, Jupiter, Juno, Apollo, &c., are all and each names of deity, which have been received as universal terms, and by the truly universal mind will or may be received again for ever. God has every name. We quarrel with no man about the name of God. It is with exclusionists that we dispute—with men who reject this name and that name: this, because the Heathens employed it as the name of their deity; that, because the Christians employed it;—One, because it was the name of an anthropomorphous or man-shaped God; the other, because it is the name of a living or personified God. With such men we say we dispute, because they are illiberal, and cannot reconcile their minds to the idea of a universal Deity, being resolved to exclude something from the whole, which exists in the whole; and we only insist upon a universal term, which will include the three supreme ideas of *goodness, wisdom, and power.*

From these three attributes proceed the flow of being in time and space; and, as that being evolves itself, it only manifests the varying God. It is in time that he reveals himself to us; and especially in that portion of time constituting the history of our own species, and of the planet of which he has given us the sovereignty. All the phenomena of our globe, whether geological, vegetable, or animal, are merely the manifestations of the great universal power, wisdom, and goodness. These three attributes are axioms which require no proof. God must be all good, because he has no opposition. He must be all-wise, because he does every thing. He must be Almighty, because there is no rival power. This is merely the Owenian doctrine of "circumstances" applied to theology. Men are good when they have nothing to irritate them which they cannot at pleasure remove. It is an axiomatic principle.

Goodness absolute must employ relative evil as a principle of action—evil is an artificial opponent, set up to be put down. It is an object on which energy exercises itself. We cannot imagine a state of *active* being without it. This evil is threefold: physical evil or pain—intellectual evil or ignorance—and moral evil or hatred. All these, therefore, *must* exist in a state of activity. So says necessity, and that necessity is wisdom, and goodness, and power.

There is no doubt an infinite variety of ways in which this evil may appear, but the way selected for this world is that which history records. Its first symptoms are political and religious strife about fractional property and fractional truth; the infinite divisibility of matter is equalled in the spiritual Nature by an infinite divisibility of mind. There could not be a better nor a wiser beginning of an active career for rational beings. Here is a world of evil to contend with—laws also of being so organized as to assist them in rising out of the mire, and gradually diminishing the evil of their first condition. Were the most benevolent and intelligent mind amongst us invested with creative power to make a race of rational beings, he could not invent another method of introducing them into active life—To make them happy at first would be to make them irrational inasmuch as it would be conferring upon them that which it is the business of reason to discover, invent, and elaborate.

What God has done, therefore, is wise, and it is good; and where is the fool who can call it in question? He must be such another as the King of Castile, who pompously boasted that he could have taught God Almighty a much better method of making the universe. Alphonso was justified in that he himself had not a correct idea of the universe he condemned; and for the same reason we justify the fool, who calls in question the wisdom of the plan which God has adopted for human progress.

Amid all the waste of intelligence and morality which society has long presented, that same power which created the waste, and bestowed its barrenness upon it, has planted a tree of hope, whose leaves are for the healing of the nations. So far back as history or even tradition recedes, this divine hope, this heavenly promise, is revealed under numberless forms. We see it in words; we see it in hieroglyphics; we trace it in rites and ceremonies, and political and religious establishments. It has been spread over all the earth. Every religion has inhaled its refreshing fragrance. Every temple has personified its virtues. Every prophet, priest, or moralist, to whom nations have reverentially listened, has poured forth its inspirations in the spirit of his own mythology.

But this is not all. The Divine Mind, having broken up into fragments the great unity of truth and love at the very commencement of society, or as it is beautifully typified in the Greek mythology, Pandora, the goddess of wisdom, having opened her box and dispersed her evils, has not only left the principle of hope as the balm to heal the wounds in the mind, but has also established a real material nucleus of reunion in the world, around which the scattered fragments of truth and love will be re-assembled.

The wisdom of Deity would have been very defective without this nucleus. This is the synthetical centre, the centre of reunion. The analysis is the breaking up, or the destruction of unity. It is the old world. The synthesis is the collecting together of the broken fragments. It is the new world—but the nucleus of this new world was placed in the world at the very commencement of the analytical process. It has thus been taking root. The seed of the woman was foreshown to be the Deliverer, so soon as evil began to reveal its fruits; and the final unity, of which that seed is the representative, was soon after politically established, amid the polytheism of the world, in the Jewish economy, which has been progressively gaining ground, and has now spread over the whole of the world of civilization and progress.

This political nucleus has, like the threefold power from which it proceeds, a threefold development. "The kingdom of heaven is likened unto a woman, who took leaven and hid it in three measures of wheat until the whole was leavened." It is evident, therefore, that two stages cannot finish it. Three stages are pre-ordained for it, and there is a propriety in giving three stages to it. It preserves the harmony of Nature, which is a great threefold process throughout, and it affords an opportunity for the development of certain opposition principles, whose exclusive and sectarian spirit it is necessary for man to know from positive experience.

The Jewish Church is the first of these three stages of the political nucleus destined by Providence to re-collect the social fragments of society. It corresponds to physical power, the lowest species of power; in this dispensation the lowest attributes were predominant. God appeared as a local deity, the God of battles, the Lord of hosts, boasting like a giant of his deeds of prowess, leading armies to battle, and glorying in deeds of blood, and in saving the *fictional* chosen people by occasional miracles, of which he always talked and boasted more than they really deserved. The heroes of this age were warriors. David, the man after God's own heart, was a man of blood, and David's mighty men were fighting men. One slew three hundred men with a spear; another killed two lion-like men of Moab, and also a real lion in a pit, in the time of snow! Such were the worthies of the man after God's own heart in this physical stage! The virtue exactly corresponded with the period to which it belonged, and the aspect under which the Deity was represented is philosophically correct, and in perfect accordance with the true idea of God in that

particular stage of progress. Worship, also, was materialized; repentance and atonement were even outward rites, of ceremonious form; and all was external, save the Divine unity itself—the nucleus—and that, by vision and dream, was represented *occasionally* under a material form. Such was the first stage of progress for the political nucleus of social regeneration.

The Christian Church is the second stage of progress, and here we rise to the intellectual basis. Intellect had no place in Jewism. Science was excluded. Christianity has eminently encouraged the intellectual principle; first, metaphysically by the gnostic, or Platonic Christianity, which constitutes scholastic theology; second, by historical and classical learning, in which it particularly excels; third, in the encouragement of the fine arts; and fourth, in the pursuit of the minor sciences. It has employed all these means, by various processes, to propagate and establish itself in the world. Having less exclusive ideas than those of Jewism, it has not been confined in its policy to the amelioration of the condition of one people; but, directing its views to principles, instead of persons, it has striven hard with all the power which it could muster to enforce those principles, even in opposition to the will, and the reason, and the common sense of mankind. It has also succeeded, to a great extent, in silencing even reason itself; and, by the mere voice of authority, substituting evil for good, and falsehood for truth. It has done so most frequently in sincerity, blindly convinced that it was doing service to men, by resisting the ordinances of what it esteemed a corrupt and a fallen nature. But this being only the second stage of the process of this nucleus of Universalism, it cannot be expected to exhibit the phenomena of the final stage. It must necessarily be evil; not because its root is evil; not because it is not divine; not because it is an imposture; but only because it is not finished. Its root is not evil; its author is divine. Its apostles, and preachers, and prophets, are not impostors. It contains the nucleus of truth and justice in the ore; the unity and universality of God in alloy. That alloy has produced the evil; and that alloy it is the mission of the third stage of this great synthetical process to remove.

The third stage is Universalism, when God shall be all and in all; when society shall be recomposed upon fraternal principles; when all religions shall be amalgamated in one, and every one have his subordinate and appropriate plan in the universal scheme, which has employed them all in evil for the development of mind and passion analytically, and will employ them all in good for the tranquillization of society synthetically by a friendly coalition. "Every people shall walk in the name of their God, and we shall walk in the name of the Lord our God for ever and ever." The characteristic feature of this third stage is moral goodness. The intellect is satisfied, having discovered the unity of God; and, being satisfied with the divine unity, it immediately lays aside sectarianism, or one-sidedness; it takes a double view of the divine agency; it sees the propriety of diversity of opinion. Instead of hating that diversity, as of old, it loves it, and encourages it, and thus it actually produces a greater variety of opinion in love than ever it did in hatred. But this new variety has a *uniting principle*. It all centres in God as its author. This, and this only, makes it innocent. Moreover, society is reconstituted upon a similar principle of unity. Interests are united. Monopolies destroyed. Hereditary rights and privileges are abrogated. Political equality is established. Men are distributed in society according to their talents and their virtues. The earth is extensively cultivated. Private interest ceases to present an obstacle to public amelioration. In short, the unity of religion is accompanied by a corresponding unity in politics. Science also keeps pace with both by referring all effects to one cause, acknowledging God the prime mover, and all physical causes to be merely modes by which the one universal cause performs the simple and eternal act of *breathing power*, which act of breathing, so easy to us, is the universal cause of all motion, life, and organization, and its impulse is conveyed into every atom of being from infinity to infinity.

* We, of course, speak poetically, and use the epithet "breathing" to express the simplicity of the act.

We have thus given an analytical synthesis of universal providence as it respects mankind. Has any man the hardihood to say it is not scientific and demonstrative? And being so, what right has any man to break the link of that divine chain which is thus running down the course of time? the same right that he has to break his own head. He will fail in the attempt. He will fail from want of skill; he will fail for want of science, for want of facts, for want of moral power; and whatever physical power he may have, whatever intellectual energy he may possess, they will all go for nothing, as they have already, for want of truth, which is the basis of the kingdom of God upon earth.

OWENISM.

THE following is the Synopsis of Owenism, containing all the fundamental principles upon which Mr. Owen builds his new fabric of society. We consider it as a very valuable analysis of society in its material and animal aspect. There are very few of the propositions to which we object. With the majority we cordially agree. There are many vacancies which we perceive, and one or two imperfections which we should remove; but those vacancies would necessarily be filled up, if the system were vigorously set on foot, and those imperfections would disappear by degrees before the light of experience. In the mean while, however, the imperfections and the vacuities hinder its progress in public estimation.

Our objections resolve themselves into one word—the Materialism of the System. But there is a beautiful consistency in it upon this principle—it is a large assemblage of political atoms upon the principle of perfect equality. No cities, no towns, no authorities; a world full of agricultural squares—an agricultural system with no provision for the imagination, no appearance of a uniting power, either in the persons, or buildings, or arrangements of the Social world. It is the most perfect system of democracy imaginable. This strictly corresponds with what he says of the Divine power of the universe, viz. that *facts* have not yet revealed what that power is. *Facts* reveal nothing else; universal facts are laws of the Divine power, and when we know the laws we know the power; if we know not the laws, it is too soon for us to begin to build systems. There was no occasion for this ignorance; but it is in perfect harmony with a material system. Our own ideas of subordination object to the uniformity and weariness of parallelisms. We love cities, towns, and villages; we love gradations of every variety, and only object to unjust gradations of hereditary privileges of appropriation, which deprive one child at birth of his social rights to confer them on another. Beyond the removal of this social injustice we believe the world never will go, and even in heaven we look for no more.

OUTLINE OF THE RATIONAL SYSTEM OF SOCIETY.

Founded on demonstrable Facts, developing the Constitution and Laws of Human Nature; being the only Effectual Remedy for the Evils experienced by the Population of the World.

EXPERIENCE has proved that man has always been the creature of the circumstances in which he has been placed, and that it is the character of these circumstances which inevitably makes him ignorant or intelligent, vicious or virtuous, wretched or happy. It is, therefore, necessary to acquire a knowledge of the influence which individual and general circumstances have over human nature; that is, to learn what particular circumstances produce among mankind ignorance, vice, and misery; and what, intelligence, virtue, and happiness; and to discover how to remove the former, and to secure the latter; and this will be acquired by the study of the following fundamental laws of human nature.

what is necessary for the happiness of a being so formed and matured; what are the best means by which to attain those requisites, and to secure them permanently for all the governed.

It will devise and execute the arrangement, by which the conditions essential to human happiness shall be fully and permanently obtained for all the governed; and its laws will be few, easily to be understood by all the governed, and perfectly in unison with the laws of human nature.

WHAT HUMAN NATURE IS, AND THE FACTS FROM WHICH THE RATIONAL SYSTEM OF SOCIETY IS DERIVED.

1. Man is a compound being, whose character is formed of his constitution or organization at birth, and of the effects of external circumstances upon it, from birth to death; such original organization and external influences continually acting and re-acting each upon the other.

2. Man is compelled by his original constitution to receive his feelings and his convictions independent of his will.

3. His feelings, or his convictions, or both of them united, create the motive to action called the *will*, which stimulates him to act, and decides his actions.

4. The organization of no two human beings is ever precisely similar at birth; nor can art subsequently form any two individuals, from infancy to maturity, to be the same.

5. Nevertheless, the constitution of every infant, except in case of organic disease, is capable of being formed or matured, either into a very inferior, or a very superior being, according to the qualities of the external circumstances allowed to influence that constitution from birth.

THE CONSTITUTION AND LAWS OF HUMAN NATURE, OR MORAL SCIENCE OF MAN.

1. Human nature in the aggregate is a compound, consisting of animal propensities, intellectual faculties, and moral qualities.

2. These propensities, faculties, and qualities are united in different proportions in each individual.

3. The different proportions of the same general propensities, faculties, and qualities, constitute the sole difference by which one individual is distinguished from another.

4. This difference in each is made by a power unknown to the individual, without his knowledge or consent.

5. Each individual comes into existence within certain external circumstances, which, acting upon his peculiar organization during the early periods of his life, impress their general character upon him; and thus the local and national character is formed unknown to the individual.

6. The influence of external circumstances is modified, in a particular manner, by the particular organization of each individual, and the distinguishing character of each individual is formed, continued, and maintained through life.

7. No infant has the power of deciding at what period of time, or in what part of the world, he shall come into existence, of what parents he shall be born, in what particular religion he shall be trained to believe, or by what other external circumstances he shall be surrounded from birth to death.

8. Each individual is so organized, that, when young, he may be made to receive either true ideas, derived from a knowledge of facts, or false notions, derived from the imagination, and in opposition to facts.

9. Each individual is so organized, that he must necessarily become irrational, when he is made from infancy to receive as truths false notions; and can only become rational, when he shall be made from infancy to receive true ideas, without any admixture of error.

10. Each individual is so organized, that, when young, he may be trained to acquire injurious habits only, or beneficial habits only; or a mixture of both.

11. Each individual is so organized, that he must believe according to the strongest conviction that is made upon his mind; which conviction cannot be given to him by his will, nor be withheld by it.

12. Each individual is so organized, that he must like that which is pleasant to him, or which, in other words, produces

A RATIONAL GOVERNMENT WILL ATTEND SOLELY TO THE HAPPINESS OF THE GOVERNED

It will ascertain what human nature is; what are the laws of its organization, and of its existence, from birth to death;

agreeable sensations in him ; and dislike that which is unpleasant to him, or which, in other words, produces in him disagreeable sensations ; and he cannot know, previous to experience, what particular sensations new objects will produce on any one of his senses.

13. Each individual is so organized, that his *feelings* and his convictions are formed for him by the impressions which circumstances produce upon his individual organization.

14. Each individual is so organized, that his will is formed for him by his feelings or convictions, or both ; and that his *whole character, physical, mental, and moral, is formed independently of himself.*

15. Each individual is so organized, that impressions, which at their commencement, and for a limited time, produce agreeable sensations, will, if continued without intermission beyond a certain period, become indifferent, disagreeable, and ultimately painful.

16. Each individual is so organized, that when, beyond a certain degree of rapidity, impressions succeed each other, they dissipate, weaken, and otherwise injure his physical, mental, or moral powers, and diminish his enjoyment.

17. Each individual is so organized, that his highest health, his greatest progressive improvement, and his permanent happiness, depend upon the due cultivation of all his physical, intellectual, and moral faculties, or elements of his nature ; upon their being called into action at a proper period of life ; and being afterwards temperately exercised, according to his strength and capacity.

18. Each individual is so organized, that he is made to receive what is commonly called a bad character, when he has been created with an unfavourable proportion of the elements of his nature, and has been placed from birth amidst the most unfavourable circumstances.

19. Each individual is so organized, that he is made to receive a medium character, when he has been created with a favourable proportion of the elements of his nature, and has been placed from birth amidst unfavourable circumstances.

Or, when he has been created with an unfavourable proportion of these elements, and when the external circumstances in which he is placed are of a character to impress him with favourable sensations only.

Or, when he has been created with a favourable proportion of some of these elements, and an unfavourable proportion of others ; and has been placed through life in varied external circumstances, producing some good, and some evil sensations. This compound has hitherto been the general lot of mankind.

20. Each individual is so organized, that he is made to receive a superior character, when his original constitution contains the best proportion of the elements of human nature, and when the circumstances which surround him from birth, and through life, are of a character to produce superior sensations only ; or, in other words, when the laws, institutions, and customs, under which he lives, are all in unison with the laws of his nature.

THE CONDITIONS REQUISITE FOR HUMAN HAPPINESS.

1. The possession of a good organization, physical, mental, and moral.

2. The power of procuring, at pleasure, whatever is necessary to preserve the organization in the best state of health.

3. The best education from infancy to maturity, of the physical, intellectual, and moral power of all the population.

4. The inclination and means of promoting, continually, the happiness of our fellow-beings.

5. The inclination and means of increasing, continually, our stock of knowledge.

6. The power of enjoying the best society ; and more particularly of associating, at pleasure, with those for whom we feel the most regard and greatest affection.

7. The means of travelling at pleasure.

8. The absence of superstition, supernatural fears, and the fear of death.

9. The full liberty of expressing our thoughts upon all subjects.

10. The utmost individual freedom of action compatible with the permanent good of society.

11. To have the character formed for us to express the truth only upon all occasions, and to have pure charity for the feelings, thoughts, and conduct of all mankind, and to have a sincere good-will to every individual of the human race.

12. To reside in a society whose laws, institutions, and arrangements, well organized and well governed, shall all be in unison with the laws of human nature.

THE SCIENCE OF SOCIETY, OR SOCIAL STATE OF MAN.

1. A knowledge of the laws of human nature derived from demonstrable facts, and which prove man to be a social being.

2. A practical knowledge of the best mode of *producing* in abundance the most beneficial necessities and comforts, for the support and enjoyment of human life.

3. A practical knowledge of the best mode of *distributing* these productions most advantageously for all.

4. A knowledge of the principles and practice by which to form the new combination of circumstances for training the infant to become the best natured human being.

5. A knowledge of the principles and practice by which to govern man under these new arrangements, in the best manner, as a member of the great family of mankind.

6. A knowledge of the principles and practice for uniting in one general system, in their due proportions, the five preceding branches of the SCIENCE OF SOCIETY ; to effect and secure, in the best manner for all, the greatest amount of permanent benefits and enjoyments with the fewest disadvantages.

CREED AND DUTIES OF THE SYSTEM.

1. That all facts yet known to man indicate that there is an external or an internal cause of all existences by the fact of their existence ; that this all-pervading cause of motion and change in the universe, is the power which the nations of the world have called God, Jehovah, Lord, &c. &c. ; but that the facts are yet unknown to man which define what that power is.

2. That all ceremonial worship by man of this cause, whose qualities are yet so little known, proceeds from ignorance of his own nature, and can be of no real utility in practice ; and that it is impossible to train men to become rational in their feelings, thoughts, or actions, until all such forms shall cease.

3. That it is man's highest duty to himself and his fellow-men, to acquire an accurate knowledge of those circumstances which produce evil to the human race, and of those which produce good ; to exert all his powers to remove the former from society, and create around it the latter only.

4. That this invaluable practical knowledge can be acquired solely through an extensive search after truth, by an accurate, patient, and unprejudiced inquiry into facts, as developed by nature.

5. That man can never attain to a state of superior and permanent happiness, until he shall be surrounded by those external circumstances which will train him, from birth, to feel pure charity and sincere affection towards the whole of his species ; to speak the truth only on all occasions, and to regard with a merciful disposition all that has life.

6. That such superior principles and feelings can never be given to man under those institutions of society which have been founded on the mistaken supposition that man forms his feelings, and convictions, by his will, and is, therefore, responsible for them.

7. That under institutions formed in accordance with the Rational System of Society, these superior principles and dispositions may be given to the whole of the human race, without chance of failure, except in case of organic disease, and influenced only by the natural consequences of our actions.

A GENERAL CONSTITUTION OF GOVERNMENT, AND UNIVERSAL CODE OF LAWS, DERIVED FROM THE CONSTITUTION AND LAWS OF HUMAN NATURE.

On the Liberty of Mind or Conscience.

1. All shall have equal and full liberty to express the dictates of their conscience.
2. No one shall have any other power than fair argument to control the opinions or belief of another.
3. No praise or blame, no merit or demerit, no reward or punishment, shall be awarded for any faith whatever.
4. All shall have equal right to express their opinion respecting a FIRST CAUSE: and to worship it under any form or in any manner agreeable to their consciences, not interfering with equal rights in others.

On the Irresponsibility of Man.

5. No one shall be responsible for his physical, intellectual, or moral organization.
6. No one shall be responsible for the sensations made on his organization by external circumstances.
7. No one shall be responsible for the feelings and convictions within him, and which are to him the truth while they continue.

On the Providing for, and Educating of, the Population.

8. Every one shall be equally provided, through life, with the best of every thing for human nature, by public arrangements; which arrangements shall give the best known direction to the industry and talents of every individual.
9. All shall be educated from infancy to maturity in the best manner known at the time.
10. All shall pass through the same general routine of education, domestic teaching, and employment.
11. All children, from their birth, shall be under the especial care of the community in which they are born; but their parents shall have free access to them at all times.
12. All the children shall be trained and educated together as children of the same family; and shall be early taught a knowledge of the laws of their nature.
13. Every individual shall be encouraged to express his feelings and convictions only,—or, in other words, to speak the truth solely upon all occasions.
14. Both sexes shall have equal education, rights, privileges, and personal liberty; their associations will arise from the general sympathies of their nature, uninfluenced by artificial distinctions.

On the General Arrangements for the Population.

15. Under the Rational System of Society, after the children shall have been trained to acquire new habits and new feelings, derived from the laws of human nature, there shall be no useless private property.
16. As soon as the members of these communities shall have been educated from infancy in a knowledge of the laws of their nature; trained to act in obedience to them; and surrounded by circumstances all in unison with them; there shall be no individual punishment or reward.
17. Society shall not be composed, as at present, of single families, but of communities or associations of men, women, and children, in the usual proportions, from three hundred to two thousand, as local circumstances determine.
18. As these new communities increase in number, a union of them shall be formed for local and general purposes, in tens, hundreds, thousands, &c., according to the less or more extended objects and interests which shall require their consideration and direction.
19. Each of these communities shall possess around it land sufficient for the support, for ever, of all its members, even when it shall contain the maximum in number.
20. These communities shall be so arranged, as to give to all the members in each of them, as nearly as possible, the same advantages, and to afford the most easy communication with each other.

On the Government of the Population; and Duties of the Council.

21. Each community shall be governed by a general council, composed of all its members between the ages of thirty-five and forty-five; and each department shall be under the immediate direction of a committee, formed of members of the general council; chosen by the latter, in the order to be determined upon.
22. After all the members of the community shall be rendered capable of taking their full share of the duties in the general council of government, there shall be no selection or election of any individuals to office.
23. All the members at thirty-five years of age, who shall have been trained from infancy in the communities, shall be officially called upon to undertake their full share of the duties of management; and at forty-five, they shall be excused from officially performing them.
24. The duties of the general council shall be, to govern all the circumstances within the boundaries of its community; to organize the various departments of production, distribution, and formation of character; to remove all those circumstances which are least favourable to happiness, and to replace them with the best that can be devised among themselves, or of which they can obtain a knowledge from other communities; to regulate and assist in the establishment of new associations, composed of the surplus population of the community; and to send delegates to the circles of communities to which they shall be attached.
25. The general council shall have full power of government in all things appertaining to the community under its direction, as long as it shall act in unison with the laws of human nature, which shall be its sole guidance upon all occasions.
26. All individuals trained, educated, and placed in conformity to the laws of their nature, must, of necessity, at all times, think and act rationally, except they shall become physically, intellectually, or morally diseased; in which case, the council shall remove them into the hospital for bodily, mental, or moral invalids, where they shall remain until they shall be recovered by the mildest treatment that can effect their cure.
27. The council, whenever it shall be necessary, shall call to its aid the practical abilities and advice of any of the members not in the council.

On the Adjustment of Differences.

28. If the general council shall ever attempt to contravene the laws of human nature, which is scarcely possible, the elders of the community who have passed the council shall call a general meeting of the members of the association above sixteen years of age, who have been trained from infancy within it. This meeting shall calmly and patiently investigate the conduct of the general council; and if a majority shall determine that it has acted, or attempted to act, in opposition to these laws, the general government shall devolve upon the members of the community who have passed the council, and who are under fifty years of age, united with these who have not entered the council, and are above thirty years of age.
29. All other differences, of every description, if indeed it be possible for any to exist in these communities, shall be immediately determined and amicably adjusted between the parties, by the decision of a majority of the three senior members of the council; except when the difference shall exist between members of the council—when it shall be, in like manner, decided by the three members who have last passed the council.

CONCLUSIONS DEDUCED FROM THE FACTS, CREEDS, DUTIES, AND PRINCIPLES; CONSIDERED IN REFERENCE TO THE PRESENT EXCITED AND UNSATISFACTORY STATE OF THE CIVILIZED WORLD.

1. That the period for introducing the Rational System for remodelling the character of man, and for governing the population of the earth in unity, peace, and progressive improvement and happiness, is near at hand; and that no human power can resist the change.
2. That the governments of the world will soon be compelled, in their own defence, to adopt this superior system, to

prevent their being involved in factions, anarchy, war, and ruin.

3. That this change will root up and utterly destroy the old vicious and miserable system of ignorance and poverty, individual competition and contest, and of national wars throughout the world; and introduce, in place thereof, the Rational System of Society; in which competition, strife, and wars will cease for ever, and all will be trained, from infancy, solely to promote each other's happiness.

4. That this system can be best commenced, by convincing governments of the truth of the principles on which it is founded. There must be also a sufficient number of individuals imbued with its spirit of genuine charity, affection, and philanthropy, and instructed in the best mode of applying it to practice; they must likewise possess patience and perseverance to overcome all the obstacles which prejudice will oppose to their progress; and, above all, they must be united, have full confidence in each other, and be directed by one heart and one mind.

CONCLUDING REMARKS.

Under the past and present irrational system of the world, devised in opposition to Nature, 19 out of 20, or perhaps more truly 99 out of 100, of the external circumstances formed by man around society, are of an inferior and vicious character; but under the Rational System of Society now proposed to be formed in accordance with Nature, all the circumstances under human control will be of a superior and virtuous character.

Under the existing religious, political, commercial, and domestic arrangements of Great Britain, 250 individuals cannot be supported in comfort on a square mile of land; while under the proposed system, with much less labour and capital than are now employed, 500 may be immediately supported in abundance, and in a few years after the new arrangements shall have been matured, 1,000, 1,500, and probably, without any additional new discoveries, 2,000 individuals may be so supported upon every square mile of an average quality of soil.

Such is the difference between a Rational System formed in accordance with Nature, and one founded in opposition to it.

INQUIRY INTO THE RELATION BETWEEN FAITH AND KNOWLEDGE.

ESSAY IV.—ON AXIOMS.

By the Transcendentalist.

I wish my readers to bear well in mind a maxim I uttered in my last, namely, "all reasonings proceed from axioms." Unless the premises be true, the syllogism, however logically constructed, avails nothing.

According to Aristotle, (*Analyt. post. I. 2.*) that is an axiom which it is necessary for him to hold (*echein*) who would learn anything. "To hold," means "to hold fast."

I take the word "axiom" in rather an extended sense. It is commonly used to denote a proposition so very self-evident, that none of a sound understanding can doubt it. I use the word as denoting those propositions which are not taught in a science, but must be admitted before that science be studied, however far in themselves from being self-evident. This, I think, is agreeable to the above opinion of the old philosopher, though, whether he afterwards said anything to qualify it, I am not Aristotelian enough to determine.

To illustrate this—suppose a number of persons met together to draw up rules for moral conduct, taking the Bible as their standard. They begin to inquire whether stealing be lawful; they turn to the sacred volume, and find there written, "Thou shalt not steal." The point is decided by the following chain of reasoning.

The decree of God is to be obeyed;

The book of Exodus enunciates the decree of God;

"Thou shalt not steal" is part of Exodus;

Ergo: "Thou shalt not steal," is to be obeyed.

The first proposition is a general axiom; the second an axiom of a peculiar class; the third refers to experience, as the test of its truth; and the fourth is the result. This is a speci-

men of these persons' moral science; the admission of the truth of the Bible is not taught in that science, but must be admitted as its foundation.

It is very possible that the same proposition may be the axiom of one science, and the result of another. The very proposition cited above, "the book of Exodus enunciates, &c.," may appear as the result of a biblical controversy, the object of which is to ascertain whether the book be of divine origin or not. Such a controversy has other axioms, which all disputants must admit before they can begin to argue; these probably are based on others, and so on till we arrive at a proposition, which is in itself perfectly self-evident, or at any rate one, which, in the present state of society, none will presume to question. An argument between two persons is the sign both of unity and discord.

I will throw in a word of practical advice to philosophical students. Do not always turn a deaf ear to an ingenious chain of reasoning, merely because you do not admit the axiom on which it is based. You may receive instruction as to the form of an argument, and the non-admission of the axiom will prevent your being misled from truth. A great incentive to benevolence towards philosophical opponents (if you know them to be honest men,) is an acute perception of their axioms through the ramifications of their discourse. You can then shake your adversary by the hand, and say, "My dear friend, all that you say is very rightly deduced from your premises, but these very premises I do not admit, hence there is no occasion for us to squabble."

In No. 32 of this work there is an attack on me under the signature of "Annaphel." I should rather say a "professed attack," for it is, in fact, no attack at all. I, in my former papers, merely spoke of the progress of knowledge in general, without regard to any particular branch. I admit, as well as he, that a proposition requires two conceptions, and therefore depends on these. This is no more than saying, that a man who always looks up to the sky, and draws his conceptions thence, will not form a system of botany. When he says that the "position is in the being of the proposer," and thence proceeds to the value of the propositions, he merely means that an honest man will not pursue scientific investigations which he knows to be hurtful: e.g., that an experimentalist, to find out whether a cask be full of gunpowder, will not place it in a room full of innocent people, and then thrust a poker into it. All this I know very well, and fully admit. Still the moral state only causes the direction towards one sort of knowledge in preference to another, and has nothing to do with the pursuit of knowledge in general. Annaphel has strangely confounded moral good and scientific truth, and by making the first the condition precedent of the last, has fancied that he can contemplate, as a determined moral being, that abstraction which stands above relation, and which I have called "being equal to non-being." There are two propositions which Annaphel of course will not admit, but which must be admitted by all who would understand my papers.

1. The purely scientific man pursues truth alone, regardless of the good or evil that may result.

2. The purely moral man pursues good alone.

Hence, he who studies science for the sake of a moral good is not purely scientific. In No. 27 was an article headed "Mysticism and Science," in which a most monstrous proposition was uttered. "The Mystic," says the article, "is an essentially scientific man, but the scientific man does not reach to mysticism; just as the algebraist covers the arithmetician, and goes much further."

Why does the algebraist go much further? Simply, because his science (*science*, mark,) contains the principles of which arithmetic is a mere application. The mystical regeneration hinted at by the Correspondent is a change of the moral being—of the heart. Truth and falsehood begin with propositions—science is the pursuit of truth by a reasoning process, and it is uttering a most startling hypothesis to say, that even the highest state of moral being will give a knowledge of the differential calculus.

These modern mystics do not perceive their own nihilism, and this is the cause. They feel a longing after something,

which they say is beyond the reach of science, and this very longing is to them a sufficient proof that this something has a definite existence. Hence their asceticism; they abstain from corporeal gratifications, lest their heart should be so intent on the good things of the world as to cease directing its energies to this "something." Hence their incapability of communicating by language the state in which they find themselves. A simple feeling cannot be communicated, words merely belong to the intellect. Another reason: they do not perceive their nihilism is their love of symbols. Almost all modern mystics love pictures painted with gaudy colours, and the instructor can say to his pupils, "this green circle represents such a state, this black curve another. This blue square is the unregenerate state; the yellow adjoining one is the regenerate state; the line between them is the seat of struggling between both. This wafer represents the soul—I slip it from one square into another, and thus you see the progress to beatitude." The poor pupils see the wafer glide along, and therefore erroneously conceive they understand the thing signified. A symbolical illustration is often useful, when we merely use it to put an abstract subject in a familiar light; but, with the mystic, the symbol is often nearly taken for a proof instead of a mere illustration, and he is almost inclined to say, that such and such is the state of the soul, BECAUSE (not merely "like as,") such is the state of the wafer. It is worthy of remark, that the mystics, who so incessantly profess supersensualism for the enforcement of their doctrines, appeal more to the senses than any sect whatever.

There is one good order of mystics, namely, those whose imagination goes further than their intellect, but who, at the same time, utter symbolical expressions to which the more intellectual man can give a scientific meaning. Such a man was Jacob Böhme, who had a brilliant imagination, and whose writings are discovered to contain many expressions, which, if put in another form, become scientific propositions. He, I believe, was no ascetic. A very clever author—Göschel, has written a book, to show how Goethe and Hegel uttered the same things, the one as a poet, the other as a philosopher.

Remember, scientific friends, that "all reasoning depends on axioms," and that an axiom is a *proposition*. Bear this steadfastly in mind, and no mystic on earth can shake you, unless, indeed, you admit *his* axiom: "the heart is the test of scientific truth."

THE TRANSCENDENTALIST.

THE OMNIVOROUS ANIMAL.

TO THE EDITOR OF THE SHEPHERD.

SIR,—As some of your comments on my last note call for immediate reply, I shall delay my intended letter for that purpose.

You say that I am placed in a dilemma, because, while I attach much importance to the question of animal food, I make light of external arrangements. And you come to this conclusion on the ground that *food* is a thing quite as outward to the mind as *clothing*, and lodging, and social forms.

Surely you will perceive, on very slight reflection, that this latter is a hasty assertion, contrary to the facts of the case. I am half inclined to think you put it forth to try whether your words met with proper attention, and not because you did not see the very obvious difference. I shall, however, reply seriously, like a dutiful student.

If we did no more with meat than we do with clothes, that is to say, handle them, wear them, put them on and off the external body in a mechanical manner, it would have the same relation to the mind that our coats have. But we do a vast deal more with it than this. Were food to pass through the body totally unaltered, I might even then assert a closer intimacy with our being than for the external clothing.

When, however, it is considered that the action of eating is not alone of a mechanical nature, but is also chemical in the most complicated degree; that meat enters into the very composition of the body itself by assimilation, it must be seen that to compare the functions of eating with that of clothes-wear-

ing, as showing a similarity, is, beyond doubt, a large error. The word "chyme" should of itself suggest a deeper value. This, which describes only a small portion of the process, has been found sufficient to cover one of the most extensive and wonderful sciences which modern practical philosophy can boast. The whole process is utterly beyond the imitation of any science; and another word would seem to indicate that the science of "chylistry" has yet to be invented.

A person may certainly have his or her vanity unduly excited by the wearing of very fine apparel, and hence arises an argument in favour of plainness. But this influence, though more than you have set down, is trifling compared to the repeated excitement of flesh-eating. For at the worst the bad consequences fall entirely on the wearer and his weak admirers or envious, but the consequences of assimilating and incorporating improper food extend to unborn innocent generations.

So of other external affairs. They are all of inferior importance, and their baneful influence may be repelled individually; but when once the act of eating is fully accomplished, the results must follow. No one could un-poison himself by a strong will. The list of diseases arising from bad diet is a great deal longer than that originating in bad clothing, or bad lodging.

There is one excuse very frequently used by flesh-eaters, upon which I may be allowed a word. When driven from the ground of necessity, or when admitting the impropriety of the practice, they say that having adopted it for so many years it has now become a fixed and permanent habit. It is so much at one with their nature, that to attempt a reform would be certainly to shake their system to the foundation; probably to ensure premature death.

Allowing this to exonerate the old habitués, who perceive and acknowledge the advantages of abstinence, what shall we say to their bringing up their children in the same practice? In this case there are no habits concentered on the being. Why not then rear them in but one degree nearer purity than we are ourselves? Any one may confirm the fact that meat, especially fat meat, which many tender mothers delight to boast they have taught their children to swallow, is an object of disgust, and a practical degradation to cleanly and simple children.

If parents must have such food for themselves, which their open example must irritate the children daily about them, let them put it on the footing of snuff-taking, or any other unexhibitable function of the animal frame, and obey the necessity out of sight. It may induce them to take less, and to occupy less time and mind in table luxuries. If they cannot sacrifice this grossness of the flesh, they must self-punish themselves in the spirit by a little secrecy, or, if they will think it so, hypocrisy.

I trust I am not recommending a breach of real morals, even though I might cover myself by the conduct of a certain clever writer in the *Shepherd*, who, being in "a position between Spiritualism and Materialism," says, at page 250, that "a man has a right to lean as much as he pleases to one side of his nature, provided he preserves the other in being, and acknowledges its influence as an elementary principle of action." As if rebellious subjects might any to their provincial governor, "we have a right to take up arms, and adopt any measures against you, provided we acknowledge your influence whenever your interference suits us."

In both cases there is a supreme authority. The local governor, as well as the individual subjects, must submit to the throne. The Spiritualist and the Materialist must both submit to the Coelestial principle. He who stands in a midway position between the two lower parties, inclining *ad libitum* to either, is no more in a situation to arbitrate between them, than is the cloth to dictate to the shears which cut it. The position of holding the shears would, I think, be a little nearer that which would enable the arbitrator to manage the other two parties.

It may be replied that this is splitting hairs, and that all such notions are included under the term "Spiritual." That whatever is not material is necessarily spiritual. I beg to deny the assertion, and, by way of exciting the reader's mind, I hope not his indignation, I shall declare that the distinction and degree of human being, between the material and spiritual

natures, are not greater nor more obvious than is the broad separation between the human, spiritual, and celestial natures.

Begging your favourable construction for this freedom, I remain your obliged,

MYSTIC STUDENT.

[We suspect that the mistake and inconsideration are all on the side of our Correspondent, who has devoted his attention so *exclusively* to inward things, that he has actually forgotten that the inward *element* of nutrition is the most *material*, and the outward element the most *spiritual*. Food is merely a re-agent in the act of nutrition. The most powerful digestive agent is from without, viz., the electro-magnetism of the atmosphere or climate, which electro-magnetism can be regulated by external clothing in such a manner as to produce good or evil digestion or indigestion. Who does not know the effects of cold and hot applications? Who does not know the value of a bit of dry or oily flannel on the throat, when the cold has disordered its vital action? Who does not know the influence of a spectacle—a rumour—a scent upon the organs of digestion, as well as upon the operations of the mind? Who does not know the influence of damp from without upon the whole inward mechanism? The blood is changed, humours are produced, the kidneys are affected, and their secretions are discoloured, new combinations are formed with the food, and that very substance which once gave satisfaction is rejected by the stomach. There is no life in the food till it combines from without with its more active counterpart. The notion of our Correspondent, respecting food, reminds us of a common belief, that a tree grows from within, and not from without; and that it grows from below, and not from above. The opposite is the truth—a tree is often rotten within, and fresh and vigorous outside. The bark deposits the albumen, and the albumen becomes the wood. The leaves prepare the principle of growth by the aid of the atmosphere and light. Supply the root of the tree with the richest nourishment, and strip it of its leaves, it ceases to grow. A new process at the root commences for the reproduction of leaves, but all its vigour is devoted to that purpose, and no new wood is formed. There is a circulation upwards from the earth, and a circulation downwards from the light; and this double process is necessary to vegetation. The analogy between this and animal life is perfect as all true analogy is, and it abundantly confirms our own doctrine, that the food from the root or stomach derives its principle of nutrition from the action of LIGHT and its electric agents. Clothing and corporeal action are therefore important branches of study; and we question much if they are well understood even in these scientific days. But we do positively think that our Correspondent acts a most inconsistent part in attaching so much importance to the lowest of all material agents—food, and a still more inconsistent part in giving any importance to *one sense* or department of a sense, and refusing it to all the rest. We insist upon the importance of all the *five senses*, and all their modes; and, in doing so, we have at least God and Nature on our side, if not the mystics.]

A PRACTICAL LETTER.

[The following letter from an intelligent Correspondent, we give for the consideration of our practical readers.]

TO THE EDITOR OF THE SHEPHERD.

SIR,—Perceiving that the welfare of the working classes is a subject in which you feel interested, I venture to offer for your consideration an outline of the only system by which, I believe, their condition can be permanently improved.

Money, says Paley, is the *representative of power*, and thus the capitalist in our manufactures exercises a *power* equal to the whole of his laborers put together; nay, in some cases, greater, for the capitalist could better afford to lose the assistance of laborers, whose place he, in a great measure, might supply by machinery, than they could dispense with the aid of his property; but if the capitalist exercises greater *power* in the manufactory, he has a right to the greatest share of reward,

for in reality *he does most*, and thus a great part of the profits is now justly awarded to one, whom it enriches, and the remainder is distributed among a number of men, for whom it merely provides subsistence. Suppose that establishments, which I shall call “co operative manufactories,” were instituted, their fundamental principle being, that *no one should receive benefit from them who did not do part of the actual labour* of the manufactory; superannuations being, by the general consent of the members, allotted to those whom age incapacitated for toil, such superannuations being of course proportioned to the circumstances of the establishment. In such establishments no one member should be allowed to possess more property than another; each workman would be a shareholder, and each manufactory be a republic in itself. Under the present system, whilst self-love continues to be the pivot of human conduct, the greater power being in the hands of one, it will be wielded to his interest, to the prejudice of the workmen; and who, or what law, can arbitrate between the employer and workman?—but here the laborers would be their own masters, and instead of the system of competition at present carried on by the capitalists, let but an amicable feeling exist between the various establishments, and they might exactly proportion the supply of their productions to the demand. The advantages of such a system are multifold and obvious—how could it be set on foot is the next enquiry.

Suppose that a number, say a thousand, of those operatives whose wages are highest, were to subscribe each five shillings per week to a general fund; this at the end of a year would produce, with interest, above thirteen thousand pounds, and in a few years enough would be accumulated to establish a large manufactory; which, once established, other members might be admitted, either by purchasing a share, *but no one should hold more than one*, or it may be earned by labour, part of their wages being paid in money, and part put to their account, and added to the general fund, until equal to the value of a share. Had all the money that has been saved by laborers, in order to raise their wages by a ridiculous strike, been applied in this way, such an establishment might be already in progress. The fundamental rules of such institutions would be—that all whom age or misfortune did not incapacitate, who received benefit, should be shareholders, *and work*.—That no one should possess more than one share.—That none should be admitted after a certain age.—That all, in the affairs of the establishment, should possess equal power, and that no one, unless, as I said before, incapacitated for labour by accident, should be allowed to receive a pension until he had served a determined number of years. Thus the whole profits of the manufactory would be divided among the workmen, and the condition of the whole be improved.

If this idea meets with your approval, I hope you will give it the publicity which the circulation of your unique and excellent periodical enables you to do.

I remain, Sir, your obedient servant,

Feb. 11, 1835.

A UNIVERSALIST.

CORRESPONDENTS.

J. Bennet.—*The two hemispheres are charged with opposite electric ties, and so are the two ends of the spin of an animal. Cunningham, on Electricity and Magnetism, accounts for the greater breadth of head and shoulder in men, and of loins in women on this principle, the positive preponderating in the male; the negative in the female.*

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*
"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 36, Vol. III.]

SATURDAY, MARCH 3, 1838.

[PRICE 1½d.]

THE BIBLE AND ITS INTERPRETERS.

THE word "Bible" means book, and "The Bible" is a title given to the Jewish and Christian revelations by way of eminence. Upon a similar principle is the word "Koran," which also means *book*, a name given to the book of the Mahometan revelation. This royal title is not unmerited, if power and universality of influence be regarded as a test. No book ever had greater circulation, or more powerful influence than the Bible. It has been published in every language, and disseminated amongst every people, and there is no educated person in the world who is not partially acquainted with its contents.

Moreover, it is almost the only book upon which diversity of opinion prevails. In all authors, ancient or modern, there are disputed passages, divers readings, and ambiguous phrases, which exercise the skill of the learned. Even in Shakspeare the readings are almost as various as those of the Bible itself. But these readings are variations of little moment, that seldom affect the sense of the passage, and turn generally upon grammatical and orthographical niceties, which serve to display the skill of the classical and oriental linguist. Were the differences of opinion confined to readings only, there would be very little Biblical or religious controversy in Christendom, and that controversy never would affect the condition of the humble classes of society. Amid all the religious disputations with which the world has been distracted, few or none of those controversies have turned upon grammatical rules or disputed readings. Those who have resorted to this pedantic mode of discovering truth, and enforcing opinion, have always been a very small and unimportant sect. The various readings, therefore, are not to be considered the cause of diversity of opinion. With one English translation all our English sectarians can freely discuss their peculiar doctrines, and demonstrate their favourite topics. The vulgar notion of a diversity of readings is ridiculous. The diversity amounts to a mere trifle, thousands of these being merely differences of pointing and spelling, which have no sensible effect upon the meaning of the passages.

The principal differences of opinion, therefore, turn upon more important aspects of the royal book, and these aspects are, what are in clerical parlance called, the *types* of Scripture. Almost all sectarian opinions are founded upon typical explanations. This shows the importance of typical investigations as the means of curing the complaints which themselves have originated. Thus, for instance, the doctrine of transubstantiation rests upon the literal meaning of the words, "This is my body." The Protestant churches in reply, say "this is a typical expression—the bread is a *type* of Christ." This typical discussion divides the Catholic and Roman churches. The Roman Church defends the literal word. In this respect the Roman Church resembles the Jewish, which also defends the literal meaning of the Old Testament. "The blood of the goat is an atonement for sin," is a Jewish doctrine. This, according to Christianity, is typical; *that is*, the true meaning is disguised under a symbol. The translation is not quarrelled with; and unless when a party is sorely pressed, he seldom requires to resort to a new translation of any passage. The prin-

cipal question is, "does the book speak literally in *doctrine*, or does it not?"

The Jews are the great literalists. But still the Jews are not wholly literalists; they acknowledge a typical meaning under the literal. The Targum is full of their typical fancies. Next to the Jews stand the Catholics, who maintain the letter of the word more frequently than the Protestants; but still the Catholics are not wholly literalists. They admit the types of the Old Testament, but deny those of the New. They are the Jews of the New Testament. The Protestants merely advance a little way beyond the Catholics, rejecting some of the most prominent literalisms of the Roman Church, and believing all the rest. The Protestants, moreover, are divided into a thousand sects upon this very topic of literal interpretation, varying from the lowest standard of the letter, up to the highest standard of the spirit.

Amongst the Protestants there is also a species of infidel party, which, by way of annihilating the letter, has invented a curious style of interpretation, which may be called etymological. It says the Bible is a fable, concealing a science under the form of history and dogma, and that the science is to be discovered by the meanings of the proper names employed in what is called the history. Thus Abraham means a father of many, Isaac means laughter, and Jacob a deceiver, and Judah the praise of the Lord; when, therefore, we are told that Abraham begat Isaac, and Isaac begat Jacob, and Jacob begat Judah and his brethren, we ought to read it, "A father of many people begat Laughter, and Laughter begat a Deceiver, and the Deceiver begat the praise of the Lord and his brethren." The Bible read in this manner is much like the cross-reading of a newspaper. Thus Saul, the first king of Israel, means hell; and David, the second king, means beloved, and he was a bloody man; and Solomon means peaceable. Now Peaceable apostatized in his old age, and the Lord rent the kingdom from Peaceable's children, and Rehoboam, his son, *i. e.*, the deliverer of the people, had only two tribes out of the twelve for his share; when this deliverer was asked if he meant to diminish the burden of Peaceable's taxation, he replied, "Nay, I will increase your burdens, and as my father chastised you with whips, I will chastise you with scorpions. My little finger will be thicker than my father's loins." The people, accordingly, rebelled against their deliverer, and rallied around Jeroboam, which means the man who fights against the people.*

* One may read English history in the same manner. Thus Pitt is the man who has thrown the nation into the *pit* of confusion. Wilberforce the man who used *wild-bear-force* to save the negroes, that is, hugging them to death, for Lord Brougham informs us that his slavery abolition has deteriorated the condition of the slaves. Earl Grey is the statesman who became *grey* with age before he attained to power. Brougham the man who *brow-beats* the Lords. O'Connell is the man who causes the Irish to cry out *ooh on*, he *ooh*annels them, and O'Connor is the leader of the *ooh on* clamour, that is the *ooh*onner. We remember a curious interpretation of Scripture by John Ward, who applied all scripture to himself: speaking of the man who

Some again, even deeper than these, will tell you the mystic meaning of countries, men, and beasts, and give a spiritual signification to mice, frogs, dogs, and horses, reading the letter by this mystic meaning, which they call the science of correspondences. This science was revealed from heaven to Emanuel Swedenborg, and is now variously taught by his followers. A rich and copious exposition of the science is to be found in Noble's *Plenary Inspiration of the Scriptures*, a work of no mean merit, however fanciful the science of correspondences may be, or seem to be; for, as all imagination must conform itself to the laws of Nature, it is impossible for a rich fancy to fail in revealing natural truths upon any principle of analysis or synthesis that it adopts, but more especially with a universal book like the Bible, whose chief peculiarity is, that it has a somewhat definite meaning upon every principle of interpretation, but a consistent meaning upon one only.

The principal motive which has induced the infidels to attempt the mystic interpretation is miracle, or divine interposition. This they all boggle at, and have tried various means to get rid of. To what effect may be imagined, from the fact, that, at this present moment, there is not a writer in the public press who has the hardihood to avow himself an infidel, although it is bruited about, with every appearance of truth, that not one half of the population of this city is connected with any place of Christian worship. It is vain to say that government has anything to do with this; it is a moral and intellectual circumstance, with which political power and wealth have no connection. Practical infidelity is very great. We believe sincerely that it embraces nine-tenths of the population. How then does the tenth exercise its power? by intellect alone—by *priestcraft* no doubt; but a craft which acts with the instruments of the tongue and the pen solely, for what it does by means of the law in its extortions and covetous graspings of property, is *inimical* to its own interests, and calculated to undo all that the tongue and the pen can effect. But such is the power of the priestly tongue and the priestly pen, that the priest can even afford to profane his own character by robbery, hypocrisy, and extortion; and yet, in spite of all this counteraction, the moral and intellectual power of the old gospel is such, that not an infidel in a public newspaper dare openly avow himself! Is not this singular? Is it not true? Is not infidelity an intellectual failure? Is it not evident, that if the infidels expect to reform the religious world they must take another ground?

And pray, what is that ground? the ground is that which has always been taken, and ever will be taken as long as the world exists. The child must come from its mother. You cannot *make* a child. The stream of time is continuous, and the present comes from the past, as the future from the present. When St. Paul, the great founder of Christianity, taught the new gospel, he abrogated old forms and ceremonies, but he never denied their divinity. He told the Jews that their existence was a part of the divine plan; but, having performed its work, it must yield to a new form of a more ethereal nature. And, in order to connect the old with the new, he showed them the new concealed in figures under the disguise of the old. He reasoned thus,—Abraham had two sons, one by a *bond woman*, the other by a *free*. When the free woman's son was born, the Lord said, "*cast out the bond-woman and her son, for the son of the bond-woman shall not be heir with the son of*

the free." The bond-woman is the law, the free-woman is the gospel. The meaning is obvious; "*cast out the old forms of bondage when the gospel comes.*" The Jews had been reading this passage for hundreds of years before Paul arose, but they never saw his meaning. But Paul, when he showed them this new meaning, did not at the same time say, "*the story of Abraham is a lie, it is a fable, there never was such a man as Abraham.*" Paul could well afford to believe the story of Abraham, and the divine allegory of Abraham at the same time. He could hold two ideas in his mind, and associate them in marriage union without any difficulty or inconsistency. This change from a lower to a higher meaning is the natural process of growth; but, as the root is the least beautiful and least valuable part of the plant, so the first, or base meaning, that is, the historical, is in itself of no consequence, except as a root from which the rest proceeds in the course of time. The universal facts, which the history teaches, exist independent of the history in universal being; but, as social and educational facts in time, they proceed from the history, and cannot be *taught* without it. Hence the necessity of the historical root which infidelity has tried to destroy, but which the omnipotence of truth has most triumphantly defied.

Now, the historical Bible presents no obstacle whatever to the very utmost excess of liberality and social peace. We challenge any man to point out a single obstacle to political, intellectual, and moral liberty, in the faith of the historical Bible. The obstacle to liberty lies in the popular belief respecting the nature of God. Here, and here only, is the evil. When society holds the faith of a universal God the mission of the Bible ceases. It is then only a relic, but a valuable relic of former times. At present the Bible acts the part of a lawgiver. It will soon cease to do so. The true God is in the heart of man; but it is the Bible itself that tells us this truth. It tells us *the time shall come* when the true God shall be born, and the true law and lawgiver placed in the human heart. When this happy time shall come the Bible will cease to be the lawgiver; but the Bible itself is a means to accomplish this end. Hence the failure of infidelity as a moral and intellectual system.

The Bible, we say, will be superseded as a statute book, for the law of God is the living law of a good heart and a right mind. This was done by St. Paul, and it will be done again. St. Paul abrogated the whole law of Moses, and at the same time asserted its divinity. He simply said, it has fulfilled its mission as a process or stage in the march of faith, and without the slightest compunction he threw it all behind him as husks for swine. St. Paul destroyed the *whole* Bible of his time. If the Jewish Church was merely a beggarly element, notwithstanding its divinity, why may not the Christian Church be the same? This is an important question. The Conservative Christians, the Tories of the faith, say Christ has completed the march of progress! Then we reply, if Christ has finished it, *why is he to come again to destroy Antichrist?* Is not the fact of another coming to destroy a corrupt system a sufficient proof that *the process* is not complete? Certainly. Then we say we have a right to conclude that this same Christian Church in which we live is nothing but beggarly elements after all. We learn this by an analysis of the book itself, which is its own reformer and its own destroyer. No infidel can harm it; faith alone will lay it on the shelf, by leading the mind of man to the God, and the law, and the Bible within, married to, and associated with, and in part the offspring of, the Bible which is without.

Is not the Old Testament laid on the shelf, and yet, in association, it reigns with the New? But how does it reign? Do we kill sheep and oxen and offer up goats and pigeons for our transgressions? Do not even the Christians abhor all sacrifices, and shudder at the thought of the Jews offering a cock to the deity, as they still once a-year, in many places, continue to do? Is not the whole history of the Old Testament merely an olden relic, which the Christian clergy themselves would be the very first to denounce as a code of laws? Every pulpit in England would ring with anathemas if an attempt were made to obey the laws of God in the Old Testament. Is it not therefore laid on the shelf? Yet the same

was put in *ward* by Moses for gathering sticks on the Sabbath day, he said this was himself in his fallen or unregenerated state. He was put in *ward*—that is, John Ward—me—and afterwards taken out and stoned to death, that is the evil was taken out of John Ward and destroyed.—John was put in *ward* for blasphemy, that is, in Derby jail. This was a deeper state of being, *more in Ward*, and when he came out he was greater than ever, inasmuch as he had been in the inner sanctuary. Now they have shut him up in the grave—*more in Ward still*; John Ward is now dead, and the spirit is relieved. May God preserve it, and fill with all the fulness of joy, in the hope of which it lived, and for which, as well as many other amiable qualities, we hold its memory in honour.

clergy who refuse to keep those statutes, are the boldest to declare their divine origin, and always prepared to defend their claims against all opponents. This is a simple fact, and merely a type of what must take place with the New, when men advance to the next stage of progress in the growth of the church. The New Testament must lose its legislative and doctrinal authority, and be regarded merely as a historical fact in the dispensations of Providence. All *but* the history is changeable or progressive. The doctrine is a principle of growth that enlarges with time, and accommodates itself to the changing and improving conditions of man. But, who ever heard of a historical event changing? A doctrine is a mode—a fashion of thought, and every age is throwing it into new positions and aspects—a historical fact is for ever the same.

The historical fact, therefore, of the Bible, is fixed as any other history is fixed; the mistakes being such as are to be found in any other book subject to the laws of human criticism, and susceptible of human correction. The doctrines are progressive and expansive. The old law becomes the old gospel, and the old gospel having assumed a variety of forms becomes a system of universal faith, in which all religious rites and ceremonies die, and religion becomes a principle of life, instead of a profession of belief. This is the process. It is tantamount to a rejection of the Old and New Testaments as literal tests of doctrinal truths, but no more. As materials, from which important truths will be calmly and logically deduced, they will always be valuable records of great historical importance. The first will take the lead of all the antique literature, and the second of all modern literature, being the only existent records of the beginning of the two eras; and they will serve as circumstantial evidence of great weight, to give effect to convictions resting upon other grounds, but deriving corroboration from the Biblical history of Providence.

We shall give in a few words the relationship in which we stand in respect to sectarians and infidels. The controversy has these four aspects, in so far as it respects the book Bible, which is merely a type or image of the true Bible, and a small portion of it at the same time:

First—Historical facts.

Second—The fact of revelation.

Third—The fact of miracle.

Fourth—Doctrine, or ultimate meaning.

The sectarian and we agree upon the three first points; on the fourth alone are we at variance. He is satisfied with the mere types or shell of the doctrine—we seek the living law of which these types were merely the temporary substitutes during the infancy of the church. The infidel puts his negative upon all the four.

ÆSTHETIC LETTERS, ON THE CULTIVATION OF THE HUMAN BEING.

BY SCHILLER.

LETTER VI.

Am I supposed to have exaggerated, in this description, the state of the present times? I do not anticipate that objection, but another—that I have proved too much. This picture, you will tell me, resembles indeed the state of mankind around us, but it also bears a general resemblance to all nations whom civilization has reached, since all, without distinction, must through false reasoning fall away from nature, before they can, through reason, return to her.

Yet, after a little attention to the character of the times, the contrast between this modern form of humanity and the ancient, more especially the Grecian, must strike us with amazement. The glory of cultivation and refinement, which we justly claim over every other *mere* nature, cannot avail us in competition with the Grecian, that wedded itself to all the charms of art, and all the dignity of wisdom, without, like ours, being itself a sacrifice. The Greeks shame us—not merely by a simplicity which is foreign to our age—they are our rivals, often our masters, in those very advantages by which we are accustomed to console ourselves for the opposition to nature which our manners evince. Complete in form and full of vital substance, in-

vestigators in philosophy and creators in the arts, tender yet energetic, we behold them uniting the youth of fancy with the maturity of reason in one glorious manhood.

At the time of that beautiful awakening of the intellectual powers, the peculiar provinces of the senses and the spiritual being were not yet strictly distinguished; for as yet no discord incited them hostilely to make division and to fix their boundaries. Poetry had not then held corrupting intercourse with wit, nor had speculation disgraced itself by sophistry. Both could at need exchange their occupations, for each, in its own way, honoured truth. However high reason might soar, it retained its attachment to reality, and throughout its minutest analyses never lost sight of it. It did indeed dissect human nature, and cast it in magnified forms into its glorious circle of divinity, so that each was distinct from every other; but this it did not by tearing it to pieces, but by blending it differently, so that no part of human nature was wanting in any single god. How wholly different with us moderns! With us, too, the image of the species is scattered in distinctively magnified forms among the individuals; but each is only a fragment, not a varied compound of the whole; so that we must inquire of the different individuals successively, in order to collect the totality of the species. One might almost be tempted to maintain that the faculties of the mind exert themselves among us as separately as the psychologist divides them in idea; and we see not only single subjects but whole classes of men unfold only one part of their capacities, whilst faint traces of the rest are, like stunted growths, scarcely to be discerned.

I do not overlook the advantage which the present race considered as a unity, and only in the scales of the understanding, may claim to have over the best in the ancient world; but it must begin the contest with closed ranks, and the whole measure itself against the whole. What single modern steps forth, man against man, to contend with the single Athenian for the prize of humanity?

Whence this disadvantageous position of the individuals, notwithstanding all the advantages of the species? Why was the single Greek able to qualify himself for a representative of his age, and why cannot the single modern adventure thus? Because to the first all-uniting nature, to the last the all-separating understanding, imparted its forms.

It was cultivation itself which inflicted these wounds on modern humanity. As soon as, on the one hand, more enlarged experience and more exact thinking required a stricter division of the sciences, and, on the other, the more complicated machinery of states made a more rigid distinction of stations and employments necessary, then the inner bond of human nature was torn asunder, and a pernicious strife set at variance its harmonious powers. Intuitive and speculative understandings withdrew with hostile dispositions to their separate fields, whose boundaries they now began to watch with distrust and jealousy, and in the sphere to which a man limited his activity, he gave himself a master within himself, who not unfrequently ended in suppressing the rest of his powers. Whilst here the luxuriating imagination ravaged the laborious plantations of the understanding, the spirit of abstraction there consumed the fire at which the heart should have warmed itself and the fancy should have been kindled.

This devastation which art and learning commenced in the inner man, the new spirit of government completed and made universal. It was not indeed to be expected that the simple organization of the first republics should survive the simplicity of the first manners and relations; but instead of rising into a higher animal existence, it settles down into a vulgar and coarse mechanism. That polytypous nature of the Grecian states, where each individual enjoyed an independent life, and when there was need could become the whole, now gave place to an ingenious clock-work, in which, from the mechanical arrangement of an infinite number, though of lifeless parts, a moral life was fashioned for the whole. The church and the state, the laws and the morals, were now torn asunder; the enjoyment was divided from the labour, the means from the end, the effort from the reward. Eternally chained down to one small fragment of the whole, man achieves his cultivation only as a fragment; with the monotonous rumbling of the wheel which he turns

round, always in his ear, he is never able to develop the harmony of his being; and instead of bearing the full impression of humanity, he becomes merely a type of his employment or his science. But even the pitiful and partial interest which joins the individual members to the whole, depends not on forms which they derive from their own activity (for how could it be safe to trust to the principle of liberty in them a mechanism so artificial and so adverse to daylight?) but it is prescribed to them, with scrupulous exactness, by a formula in which their free judgment is confined. The dead letter supplies the place of the living intelligence, and a practised memory leads more safely than genius or feeling.

When the community measures a man by his office, when it honours in one citizen only memory, in another a tabular understanding, in a third only mechanical dexterity; when here, indifferent to the character, it insists only upon knowledge, and there, on the contrary, for a sake of a spirit of order and regularity, excuses the greatest darkness of the understanding;—when at the same time it requires the peculiar skill of the individuals to be carried to an extreme degree in proportion to the limitation of the subject:—then need we not wonder that the remaining qualities of the heart and mind become neglected, in order to bestow all care on that single one which is the source of honour and reward. We know, indeed, that powerful genius does not make the limits of its employment the limits to its activity, but mediocre talent consumes in the employment which falls to its lot the whole niggardly sum of its powers; and it must be no ordinary head that preserves, without detriment to its calling, some overplus for the indulgence of tastes. Moreover, it is seldom a good recommendation to the state when the powers surpass the station, or when the spiritual requirements of a man of genius give his office a competitor. So jealous is the state of the sole possession of its servants, that it would rather determine (and who can blame it?) to share its man with a Venus Cytherea than with a Venus Urania.

So by degrees the individual concrete life is destroyed, in order that the abstract of the whole may prolong its wretched existence; and that the state always remains a stranger to its citizens, because feeling nowhere finds it.* Necessitated to relieve itself of the manifold varieties of its citizens by classification, and never holding intercourse with humanity except at second hand, through representation, the governing portion at last loses sight of it altogether, by confounding it with a mere contrivance of the understanding; and the governed can only receive with indifference the laws, that are so little adapted for them. Wearied at last with keeping up a contract, of which the government on its part does so little to relieve her, positive society (as has long been the fate of most European states) falls into a moral state of nature, where public power is only one party *more*, hated and cheated by those who render it necessary, and esteemed only by those who need it not.

Could humanity with this double force, pressing upon it from within and from without, take any other direction than that it has taken? Whilst the speculative spirit strove after imperishable possessions in the kingdom of ideas, it must become a stranger to the world of sense, and lose matter while investigating form. The spirit of business, enclosed in a uniform round of objects, and still further narrowed in its operations by prescriptive rules, must behold the free whole withdrawn from its view as if by irregular movements, and must, together with its sphere, become impoverished. As the first is tempted to model the real according to the conceivable, and to elevate the individual conditions of its own power of conception into constitutional laws for the existence of things, so the latter plunges into the opposite extreme—that of valuing all experience generally according to a peculiar portion of experience, and wishing to force the rules of its own business upon every other business without distinction. The one is compelled to become the prey of an empty subtlety, the other of a pedantic littleness; because the one takes its station too high for the individual, the other too low for the whole. But the evil of this direction of mind has not been limited to knowledge and production, it has extended in no small degree over feeling and

action. We know that the sensibility of the mind depends for its degree upon the liveliness, and for its extent upon the richness, of the imagination. Now a preponderance of the analyzing faculty must needs rob the fancy of its strength and its fire; and a more limited sphere of objects must lessen its richness. The abstract thinker often has, therefore, a cold heart, because he analyzes impressions that only as a whole excite the feelings; the man of business has often a narrow heart, because his imagination, shut up in the unvarying round of his occupation, cannot enlarge itself by any kind of experience foreign to its sphere.

It lay in my way to expose the injurious tendency of the character of the times, and its sources, and not to show the advantages by which nature repairs the evil: but I willingly grant you, that however little the individual may gain by this dismembering of his being, the race could have advanced by no other means.

The phenomenon of Grecian humanity was unquestionably a maximum, at which point it was impossible either to remain or to rise higher—impossible to remain, because the understanding, with the stores which it had, would inevitably have been obliged to separate itself from feeling and contemplation, and to strive after distinctness of knowledge—impossible to rise higher, because a determinate degree of enlightenment can co-exist only with a determinate amount of fulness and warmth of life. The Grecians had reached this point, and if they would have proceeded to a state of yet higher cultivation, they must like us have given up the totality of their being, and have pursued truth in separate paths. There was no other way of developing the various capacities in man, but to oppose them to each other. This antagonism of powers is the great instrument of cultivation, but yet the instrument only; for so long as this conflict lasts, man is only in the way to cultivation. It is only when single powers violate themselves in man, and usurp an exclusive legislation, that they come into opposition with the truth of things, and oblige common understanding, that otherwise rests with idle contentedness on the outside appearance, to penetrate into the depths of objects. While the pure understanding usurps authority in the world of sense, and the empirical is busy in subjecting it to the conditions of experience, both faculties are bringing themselves to the fullest possible maturity, and exhausting the whole compass of their spheres. Whilst the imagination there, by her licentiousness, dares to dissolve the constitution of the world, she obliges reason there to mount to the highest sources of knowledge, and to call the law of necessity to its aid against her.

Partiality in the exercise of powers leads the individual infallibly to error, but the race to truth. Only by collecting the entire energies of our mind into one focus, and by drawing our whole being together into single power, do we give this single power as it were wings, and carry it artificially far beyond the limits which nature seemed to have assigned it. As certain as it is that all the individuals of the human race taken together would never have been able with the unassisted power of sight, which nature has allotted them, to espy one of Jupiter's satellites, which the telescope discovers to the astronomer, so indisputable is it that the thinking faculty could never have produced an Analysis of the Infinite, or a Critique of Pure Reason, if in single men who had this vocation reason had not disentangled itself from every thing extrinsic, and prepared itself, by the most intense abstraction, to pierce into regions of unconditional truth. But will a mind, so resolved, as it were, into pure understanding and pure intuition, be capable of exchanging the rigid chains of logic for the free movement of the poetic powers, and of seizing the individuality of things with faithful and chaste perception? Here nature sets a bound even to universal genius, which it cannot overleap, and truth will continue to have martyrs so long as philosophy must make it her chief employment to guard against error.

How much soever the world may have gained by this separate cultivation of the human powers, it is not to be denied that the individuals whom it teaches suffer under the curse of subserviency to the general purpose. Gymnastic exercises will, indeed, produce athletic forms, but beauty is formed only by the free and equable play of the limbs. In the same way, by

* See the fourth letter,

straining to the utmost single powers of mind, extraordinary men may be produced, but only by an equable tempering of the faculties can happy and complete ones be created. And in what relation should we stand with past and future ages, if the cultivation of human nature made such a sacrifice necessary? We should have been the servants of humanity, we should for some thousands of years have endured for her the labours of slavery, and stamped upon our mutilated nature the shameful traces of this servitude, that a later race might tend its moral health, and develop the free growth of its humanity, in happy indolence.

But can man indeed be destined for whatever purpose to neglect himself? Are we to suppose that nature ought to have the power to rob us of that perfection which reason by her aims prescribes to us?

It must then be false that the cultivation of single powers acquires the sacrifice of the totality of our being; or if the law of nature tended ever so much to this sacrifice, it must be in our power, by a higher art, to repair the damage which art had occasioned.

A POEM TRANSLATED, WITH A COMMENT.

By the Transcendentalist.

In the collection of Latin poems by Englishmen, which is called *Musa Anglicana*, I met with a piece entitled *Idea Spiritus non est aquè clara ac Idea Corporis*. There is in it as little true poetry as may be, but as it illustrates in a popular and pleasant manner several subjects familiar to the readers of this work, and, as I thought I could tack on two or three observations in the form of a comment, I have translated it. The name of the author is not given, but he was a Cambridge student, and the poem is dated 1730.

THE IDEA OF SPIRIT IS NOT SO CLEAR AS THE IDEA OF BODY.

1. While, from the lofty palace of the brain,
The mind o'er subject limbs exerts her reign;
Governs with easy rule the supple nerves,
Each active sense her ev'ry nod observes;
Surveys with care the outward signs of things,
Then a true copy to his sov'reign brings.
Thus do the eyes, which by the forehead plac'd,
Guard the brains' portals; thus the ears, the taste,
The smell, the touch, which, to no member bound,
In all the body's parts alike is found.
10. While these, her true attendants, guide her way,
The mind, who, first rude and uncultured, lay
In her dark dungeon, straight begins to rise,
Gathers new wealth, and scans the glitt'ring skies.
Safe, while to these a willing ear she turns;
But if corporeal bounds she proudly spurns,
She roams through wilds unknown, and grasps at air,
Her gain is—NOTHING, and her end—despair.
20. Since from the bodies round all knowledge springs,
Our thoughts must bear the stamp of outward things.
Hence, with a motley crowd Olympus nods,
Bent 'neath the weight of bearded, biped gods.
In ev'ry nook some monstrous image stands:
See, yonder stalks dread Mars with gory hands!
Now Pallas, after many a painful strain,
Springs arm'd from human Jove's bewilder'd brain.
The mind would grasp at spirit, e'er it fades,
Gives it a form, yet, while it decks, degrades.
30. To paint the queen of love Apelles glows,
With borrowed charms the pictured goddess grows.
From earthly nymphs each beauty he must beg,
From one a lip, from one a well-turned leg.
The iv'ry neck he pilfers from some fair,
Another's locks; now gives the graceful air,
The glitt'ring darts, the eyes replete with guile,
While from the mouth the girls of Hellas smile.*

That is, the smile is copied from those of the Greek girls.

He hoped to paint a goddess—all is o'er!
There stands a mortal woman, and no more—
Chloe, not Venus, rules the Cyprian shore.

40. Celestial sprites of old were disinclined
To come within the ken of human mind,
Proudly they shunned all intercourse with man,
When Locke arose, and to reflect began.
The world of sprites is opened to his view,
He talks with ghosts, and gods immortal too;
Familiar as his home, he sees displayed
The realms of fancy, and each empty shade.
But as for us, poor things, how sad our plight,
Who live without this Highland second sight.
50. Around us elves may wander ever free.
The tiny things we neither touch nor see.
While he, who's bless'd with Locke's discerning eyes,
May see pale goblins at his elbow rise,
A Sibyl's aid as useless may decline,
Can his old dead friends e'en while living join,
And pleased count o'er his proud ancestral line.
Our minds are narrow, vainly we desire
To such high contemplations to aspire.
Belinda cannot see the airy band
60. Of watchful sylphs, who ever near her stand,
Knows not, her small attendants never fail
To guard each ringlet from the ruder gale;
That round her dress sprites without number meet,
And make the robe fall graceful to her feet.
"Some fold the sleeve, while others plait the gown,
66. And Betty's praised for virtues not her own."

THE COMMENT.

The title: (*The idea of spirit is not so clear as the idea of body*).—Why not? The whole poem is directed against Locke, who maintained that body was only manifested by its qualities, and that the qualities of spirit, such as *thinking*, &c., were likewise perceivable. Hence, both were equally manifest. How is it that so many fall into absolute materialism, and so few into absolute idealism? This natural tendency to one of two poles deserves consideration. The following appears to me to be the solution of the difficulty:—Our notion of spirit is got from reflection,—a looking back upon ourselves; we do not stand like third parties with matter at our right hand, and spirit at our left. "Spirit" means ourselves, as distinguished from external objects, and the question is, whether it be so easy to look at home as to look abroad. I have before said, that were it not for objects around, our own existence would not be manifest; but that does not prove, that, granted the presence of the objects, the notions of spirit and matter should not be equally clear. The fact is this: spirit first contemplates external objects, while so employed its attention is directed, of course, outwards; it is thinking of matter, not of itself, and is not performing an act of self-reflection. And when it does look back upon itself, it only regards itself as the perceiver of the objects, that is, only as in relation to matter. Hence, spirit can think about matter without thinking of itself, but cannot think of itself without thinking about matter. Our Cambridge friend is right then so far, though, I am convinced, the reasons I have alleged had no part in prompting him to take his peculiar side. Understand, my observations do not in the least veer towards materialism, or an acknowledgment of the independent being of matter. The eye, to which the whole visible world is revealed, does not have a glimpse of itself; but who, in affirming this, would be accused of denying the eye's existence?

Line 6. (*True copy*.) In the Latin "*exemplaria*," an expression which involves one of the most puzzling subjects in metaphysics. Fichte, the young, now professor at Bonn, has written much valuable matter about it. The notion was, that as things external to the mind cannot be within it, and our im-

* Æneas required the aid of a Sibyl to conduct him to the world of spirits.

† These concluding lines refer to Pope's "*Rape of the Lock*;" the couplet in inverted commas is by Pope.—T.

pressions of course are in our minds, we never perceive the things themselves, but only have impressions, which are copies of them. This theory gave rise to a sceptical question. If we only perceive the impressions, and not the things, how can we possibly tell that the former are copies of the latter? The severe idealism rose from this question; seeing that there is no comparing a known with an unknown thing, so as to find out whether one be a copy of the other or not, and also admitting that we perceive nothing but impressions, the idealist boldly cuts off the trouble of comparison by denying the existence of external things altogether. Still, however, the corporeal world has never ceased to assert its claims to existence; the mind finds that there is a number of objects utterly independent of its own will, and what is this, but finding that they do not depend on itself? The idealist will maintain, that the so-called real things are produced by spirit, *without* consciousness, and that the imaginary things are produced *with* consciousness. But, how does this prove mind without matter? Mind is manifested by consciousness, and what right has it to attribute to itself acts of which it is unconscious? Can there not be a third principle, which is neither mind nor matter, but develops itself in both? Kant had a very odd way of avoiding severe idealism, and at the same time of steering clear of the untenable notion of a copy. He said that there were external things, but that our perceptions were totally unlike them; that we could have no conception of the external world in itself; and hence that things were literally concealed by their own manifestation. However, this vast, inconceivable mass (which was called the *noumenon*) seemed but lumbering, and Fichte, the elder, raised once more the standard of absolute idealism. He found that nothing can be an object, except that which is limited; that spirit* to contemplate itself, or become its own object, must necessarily set a limit to itself, and hence he ingeniously made the material world spring from the very essence of spirit. But though he thus accounted for a material world on the principles of pure idealism, his theory was not satisfactory. He had indeed deduced a limit; but whence could he draw the variety of our limits, the thousand different sensations and phenomena which all-bounteous nature bestows? At last comes the identity-system, the placing the absolute neither in spirit nor matter, but in an indifference of both, and the making thought and being both the same, not one a copy of the other. From this point German philosophy is working at present. Understand by the word "spirit" I have only meant "spirit as manifested to us." Doubtless "spirit," as applied to the Divinity, has a different sense, not meaning a something dependent on another pole.

Line 9. (The touch).—I have not exactly rendered the Latin, and as the original passage is good, I have transcribed it:—

"—qui per totam currit sparso agmine molem
Tactus, ad extremas speculator corporis oras."

The observation offers food for reflection. Is it not singular that while all the other senses should be confined to one particular part of the body, the touch should be spread all over it? An instructive essay might be written on this.

Line 19, and following.—The requisition of symbols under sensuous forms is here well set forth. Compare it with what I said in my last essay. The author deduces polytheism from the attempt of the mind to grasp what is beyond it, and then finding nothing, filling up the chasm with mere corporeal forms.

Line 43. (Locke).—Wonderful! The empirical unsoaring Locke sneered at for being too mystical! The fact is, our Cambridge friend, in sneering at Locke, has only exposed himself. Locke merely regarded spirit as naturally manifested, and our sapient poet instantly makes him a contemplator of spirits as supernaturally manifested. We now discover, what we must have suspected all along, that he knew nothing of his subject, but that his poem is the result of a monstrous state of confusion. Apparitions are downright sensible forms, determined and distinct; there is no more difficulty in conceiving a

ghost than a living man; they are not assumed as symbols, cannot be made out as allegories like the heathen deities, but are by their believers considered as downright existing objects. These considerations lead us to a twofold division of the mystics. The first are those who spring from a Cartesian basis, who dwell in self-contemplation, who think that spirit or the soul, abstracted from all outward things, can be manifested. These are the persons I have accused of nihilism. Another party of mystics are totally distinct from these; they think nothing of self-contemplation, but believe in an intercourse with the spiritual world, which they suppose peopled with beings as visible as anything in this earth, and of course belonging to the class of external objects. It would be the highest injustice to accuse these parties of nihilism; what they call spirits being no abstractions, but merely a refined sort of bodies, which are within the ken of the understanding. Those mystics I alluded to in my last, as eking out the understanding with the imagination, while the more intellectual class are able to give their images a scientific form, make the connecting link between the two classes. Like the latter, they openly require sensuous forms to dwell on; like the former, they do not give these an external being, but make them spring from their own mind. The first class of mystics is rather a portrait of a state aimed at than a state possessed, and the self-contemplatists are glad to become friends with the seers, as being able to give a form to their abstractions. Still, though the same man may belong to both parties, they are entirely distinct. Our poet has confounded them; and when he ought to have accused Locke of a tendency to nihilism, he has, by a palpable blunder, made him a ghost seer. A systematic body of the second order of mystics are the Swedenborgians, who are neither self-contemplatists nor ascetics.

THE TRANSCENDENTALIST.

THE STATISTICAL SOCIETY OF LONDON

Are likely to get into a position which is commonly compared to an uncomfortable immersion in "hot water." The members have actively and energetically taken up the subject of "Strikes" and "Turn-outs." A committee has been appointed "to occupy themselves in collecting a statistical account of the various strikes and combinations which have existed in different parts of the united kingdom, for the purpose of altering the rate of wages, and of introducing new regulations between masters and men."

On the 19th ultimo, the first paper on the subject was read before a numerous meeting of the society, of which the particulars have been reported to us. It was on the strike at Staley bridge and Ashton in the winter of 1830-31. But, although it pretended to be an impartial statement of that important affair, it was so decidedly one-sided, that we forbear to publish any particulars or abstract of it. Questions were asked by some of the company, which showed at once that the strike originated with the masters, and not with the men.

The Society has put together a formidable list of fifty-seven questions, which we subjoin. Our working readers will perceive at once how strong a spice of favour towards the capitalists is infused throughout the whole. This Society sets out with a notion of its perfect impartiality, and, at the meeting, it was curious to observe the phraseology of every speaker. They all avowed the necessity of *appearing* impartial, but not one avowed the necessity of *being* impartial. The members may suppose this is only a grammatical criticism of ours. We assure them, their words truly and faithfully express their actual state of mind. So clearly do we see the mental position of these statistical inquirers, whose labours we hope will yet do much good, that we feel it requisite to acquaint the working men with what is going on.

The New Poor Law began with inquiries much farther from direct government cognizance than this society, and no doubt something is intended by, or will grow out of, the researches of these political economists. These measures, whatever they shall be, cannot be of that progressive nature which the condition of man demands, if they are to be founded on a state of mind which is so thoroughly imbued, as these papers show, by the pre-supposi-

* "Spirit and matter" are not Fichtean words, but I have used them to preserve the connection.

tion or prejudice, that the working people are always in the wrong, and that the results of strikes are always injurious.

If the operatives think it worth while efficiently to counteract the machinery of these theorists, they should at once form a Statistical Society of their own. This would cost them little time or money, for they have amongst themselves all, or almost all, the facts necessary to be brought before the public. Let the unwashed wash themselves for once, and meet these philosophical inquirers on their own ground. In point of knowledge of the subject, the operatives are immeasurably beyond the members of the London Statistical Society, whose station in life necessarily precludes them from a familiarity and sympathy with workmen, and the results of laws affecting their well-being.

At all events, we hope that some active and well informed individuals will draw up a list of fifty-seven questions, not exactly opposed to these, because errors on one side will not correct errors on another side, but which shall have the strongest possible tendency to elicit the truth. Working men, who feel strongly that truth is with them, need not enter into narrow disputes: they can afford to meet the subject fairly.

STATISTICAL SOCIETY OF LONDON.

Queries formed for the purpose of collecting a Statement of the origin, progress, and consequences of individual Strikes.

1. Name of town or district.
2. Population of ditto.
3. *Characteristics of the population*, and of their staple employment, with reference to the strike.
4. State the circumstances of the trade, whether flourishing or otherwise, at the time of the strike.
5. State the occupation of persons engaged in the strike or combination, showing the particular class with which it originated.
6. What were the average weekly earnings immediately before the strike, and when in full work, of the class with whom the strike originated?
7. Were the earnings, or other circumstances of the workmen, with whom the strike originated, inferior to those of persons employed in the same branch of manufacture, in the same or neighbouring towns or district?
8. Were they in any way, and in what way, superior?
9. State the number and description of workmen and other persons whose employments depended upon those of the persons engaged in the strike, and who were consequently deprived of occupation during its continuance.
10. What were the weekly earnings of the persons last described?
11. State the estimated value of buildings and machinery rendered inactive by the strike.
12. State the estimated floating capital of manufacturers and masters rendered inactive, and consequent amount of loss.
- Detail the mode in which this estimate is made.
13. Did any *Trades' Union* exist in the district before the strike, or was any formed in consequence?
- Number and description of its members—its constitution—rules for management—remuneration of officers—its declared objects—mode of operation.
14. Were any and what *compulsory measures* taken to make workmen join the union?
15. Did any association of masters exist in the district before the strike, for counteracting the operations of Trades' Unions, or for any other purpose?
16. Did the strike originate in the town or district, or was it part of a more extensive plan, and was it fomented by delegates from any other body of workmen?
17. Was the strike under the direction of any Committee; and, if so, what was its constitution and mode of operation; and had that Committee absolute and secret powers?
- Exeuvour to furnish a copy of the rules.
18. What was the ostensible cause of the strike or combination; state whether any and what notice was given, either by the masters or men, as the case might be, of the time of its commencement?
19. Were any and what proposals for accommodation made by either party for the acceptance of the other?

Send copies of any papers connected with such proposals.

20. On what day did the strike commence?
21. In how many establishments did the strike prevail? In how many did the workmen continue employed?
22. State the number of persons engaged in the strike or combination, and the number who continued at work.
23. How were the different descriptions of workpeople supported during the strike? From what source was the fund derived? What were the rates of weekly allowance of different periods? What the aggregate sum thus distributed? How long did the funds last? What were the expenses of management? Send papers, if any.
24. Was any subscription raised, or money voted from corporate, or other funds, for relieving distressed persons during the strike? What regulations or limitations were imposed in the distribution of the money?
25. State the sums expended for the relief of the poor from the parish funds, in each week during the strike, and in each of the twelve weeks thereafter, comparing the same with the corresponding period in the preceding year.
26. Were any of the workpeople able to resort, and did they so resort, to any other, and what other, modes of occupation, at any time during the continuance of the strike?
27. How otherwise did they pass their time?
28. Was there any perceptible increase of the class of street beggars?
29. Was much sickness or increased mortality observable during the strike, or consequent upon it?
30. State the number of persons who were admitted into the several hospitals, or received medical attendance, during each week of the strike, and for each of the twelve weeks thereafter. Give weekly statements for the corresponding weeks of the preceding year.
31. Was there more than the usual amount of drunkenness and disorderly conduct witnessed in the streets?
32. Were any, and what acts of violence against persons or property committed by the discontented workmen, particularly with reference to new hands employed, or old hands not turning out?
33. Was it necessary to call in the aid of military power, or to add to the force of the police, in order to preserve the peace?
34. Can loss of human life be either directly or indirectly attributed to the strike?
35. Were any ill effects visible in the criminal calendar attributable to the strike?
- Give weekly statements of the number of persons committed, and the nature of their offences during the continuance of the strike, and for three months thereafter. Give also statements of the committals in the corresponding weeks of the preceding year.
36. Did the people while unemployed contract degrading habits? Were those habits abandoned or continued beyond the period of the strike?
37. Was any diminution observed in the attendance at schools of the children of parties engaged in the strike?
38. What was the amount of money in the Savings' Banks of the district on the 20th of November in each of the three years preceding the strike; and what was the amount just before the strike began?
39. What proportion belonged to the class of discontented workmen?
40. What was the aggregate amount of deposits when the strike ended?
41. What proportion then belonged to the discontented class?
42. Give similar statements for any Friendly or other Benefit or Loan Societies.
43. Did the work people contract debts, and to what amount, when unemployed?
44. Have they since been able to pay off their debts?
45. Did the manufacturers and masters have recourse to any, and what means, for supplying the places of discontented workmen?
- In particular, were any mechanical inventions newly introduced to that end?
46. How far were those measures successful?

47. State the day on which the strike ended. How many weeks were the workmen unemployed?
48. How many, when willing to work, were able again to find employment?
49. By what means were they induced to resume work?
50. Upon what terms did they return to work?
51. State the number of hands who were permanently retained by the masters after the strike.
52. What rate of wages did they pay to new hands, compared to what had before been paid to workmen similarly employed?
53. What number or proportion left the district, or continued in it unemployed, or employed in occupations different or inferior in emolument to those they had previously filled?
54. Has there been any difference observable in the mode of living, and in the personal and family comforts enjoyed by the operatives before and since the strike?
55. Have any of the master manufacturers been induced by the consequences of the strike to quite business, or to remove to other localities, or have any of the masters failed in consequence of the strike?
56. Estimate the pecuniary loss to the town or district occasioned by the strike, and distinguish the proportions of that loss borne by the workmen, the manufacturers or masters, the shopkeepers, and other classes respectively.
57. What has been the effect of the strike on the trade of the town or district?

NOTE TO THE WORD "PRIEST," IN THE ST. SIMONIAN CHART.

In employing the word Priest, we do not conceal our belief of the offence which it is likely to create, especially with those whom we regard as most closely allied with ourselves. Criticism has terminated its career in destroying Christianity. Religion retrogrades in respect to the present wants of humanity. At present, the first step which ought to be taken is to acknowledge that Catholicism, that is to say, Christianity in its highest degree of perfection, has led the march of humanity for fifteen centuries. It ceased to do so under the pontificate of Leo X., and since that period men, struck with the evils occasioned by the Christian religion, and by the Christian priests, have conceived a horror of religion in general, and of priests in general. But another prejudice, the necessary consequence of criticism, still rises both against religion and the priesthood. The priest, it is said, ought never to interfere with politics. This is very true for the Catholic priests, and for the priests of Christian sects, or of the ancient religions which still exist; for now they can do nothing but evil in interfering with politics; but in a social order, where politics and religion are in progress, and are identified by an equal contribution to the moral, intellectual, and physical amelioration of humanity, there is a propriety in calling the *governors*—priests. But if this name be objectionable, because in history it has belonged to oppressors, we ask if kings, emperors, tribunes, democrats, aristocrats, directors, even presidents, have not also been oppressors? We ask if, in respect to the future, the past ought not to be considered equally tyrannical in the political as in the religious department? Notwithstanding, since the St. Simonian order is principally religious, the name of the chiefs of this order ought to indicate that they are clothed with a religious character—that they are *priests*. Moreover, we prefer this denomination, because the last hierarchy of priests that we find in history, that is to say, the Catholic hierarchy, is the only one which has admitted into its bosom the principle which we establish for the whole of society, namely, "*Retribution according to works, and classification according to capacity, independent of the privileges of birth.*" Without doubt, new names will be given ultimately to new classes, orders, and powers, without doubt human language is far from being complete. But besides the inconvenience of losing, by the creation of a new word, the traditional link that ought always to unite the past with the future, the same explanations and justifications would have been necessary

to demonstrate the value of these new words, and to popularize them. Let us dive, then, to the depths of facts, without being afraid of the phantoms of the past, and we shall find that the sacerdotal character is, and ought to be, the true character of the St. Simonian hierarchy. The same observations ought to be extended to all words borrowed from Christianity, which are to be found in this table.

CORRESPONDENTS.

W. Barber.—*We take neither side of the question. We are neither with men nor masters. But the worldly wisdom or policy of the masters is superior to that of the men. The reason is, they are smaller in number, and more powerful in resources. The men being a huge and unwieldy multitude, jealous of each other, and without pecuniary resources, have not the means of obtaining a victory over the masters by a strike alone, unless, as the New Moral World of last week insinuates, they employ the capital in their own savings' banks to make masters of themselves, an idea corresponding in character to the plan proposed in the Shepherd, by a Correspondent last week. The old radicalism of the people is dissolving rapidly. The disciples of that school of sand are abusing each other in unmeasured terms, and almost daily we hear one Radical vilifying another, and venting all his fury, like the religious, on those who are most closely allied to himself. Radicalism and Infidelity are what the St. Simonians called critical eras, eras of subversion for old forms. A new organic era must succeed, upon a principle of organic unity, both in politics and religion, otherwise society will go to desolation. Ruin, however, is impossible. Provision is already made for the future. Truth will spring from earth, righteousness look down from heaven. The stars in their courses are fighting for us, by scattering our enemies. We could as soon believe that the multiplication table is wrong, as that our general principles are false. We shall rest in peace in our little island, and see the storm disperse the huge armada of political and religious humbug. There is an article on St. Simonism in the January (7th) number of the Dublin Review, which we would advise our Correspondent, and all our readers to peruse; with many faults, and some smatterings of old bigotry, there is a rich repast for a thinking mind in the contents. The Queenies would learn something from it, and their social father appears amongst the other spirits which the magician has conjured up to gratify his readers.*

B. J. has read more upon the subject than we have; but in the work to which he alludes there is none of the information he is in quest of, and we question much if he will find more than in the third of the works he has mentioned. It is not a subject for the Shepherd, although one of considerable importance.

C. Dyer.—*We are obliged to our Correspondent for his extract, and will probably use it.*

We expect to employ our pen in some other publication about the close of the summer season; but whether it be in the "Cowherd," or the "Swineherd," we cannot tell. Time will tell.

ERRATUM.

In our last week's notice to Correspondents, for "spin" read "spine." It was at one time "space;" we marked out two letters, and the compositor, to make sure work of it, took out three.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 37, VOL. III.]

SATURDAY, MARCH 10, 1838.

[PRICE 1½d.]

JUSTIFICATION OF THE DIVINE NATURE AS THE SOURCE OF GOOD AND EVIL.

Two urns by Jove's high throne have ever stood,
The source of evil one, and one of good;
From thence the cup of mortal man he fills;
Blessings to these, to those distributes ills;
To most he mingles both. The wretch decreed
To taste the bad unmix'd is curst indeed;
Pursued by wrongs, by meagre famine driven,
He wanders outcast both of earth and heaven.

Pope's Homer's Iliad, b. 24.

THE title of this chapter leads us to the discussion of one of the principal subjects for which the *Shepherd* was started. It is chiefly an intellectual question, but one upon which all religious controversy hangs, and by which alone peace can be procured. There are many minds who can find peace by letting all such questions alone, and many more can find private satisfaction in keeping aloof from all religious and political discussion. It is only in our public character that we ourselves care for either. We should be very glad to know that this is the last day in which we should ever discuss a controversial point in theology or politics. We hate controversy. We hate pain also, and many other evils which are incumbent upon us, and of which we cannot rid ourselves.

But were we to let controversy alone, others would not. The mind is a restless thing—it must have employment. It is a curious thing, and it must have satisfaction. This restlessness and curiosity lead it to the very point which we have chosen to dilate upon.

All the systems of the world are based upon the faith of a one-sided deity, the author of good only; and as all men differ respecting good, the deity of one party is rejected by another. Were this faith removed, men would correspond upon a different principle, and seek truth independent of what is now falsely called Divine authority. They would seek it inwardly in that wisdom—which reads the book of universal Providence independent of external injunction—which reads the history of man, and discovers the law of God respecting man therein.

When a smith is at work, he has two pieces of metal in his hands; one piece beats, the other is beaten. He cannot work without these two, and one must be stronger than the other; to make one soft, he heats it; to keep the other hard, he preserves it cool. With hot and cold materials, therefore, the smith works, and produces the instrument which his inventive faculty had predetermined to make. When two smiths are at work upon one instrument, there is no occasion for heating one of the smiths, *i. e.* for having a cold and a hot smith to work the metal with; the two smiths may be equally hot. It is the materials only that require to be opposed to each other in hardness and softness, heat and cold. The single smith represents God in his universal character, as a director of social progress; the materials represent men. These materials must be placed in antagonism, in order to act upon each other; and as the smith makes one hot and the other cold, one hard and the other soft, so the creating mind produces various states of

being for action and re-action, assertion and contradiction. We cannot imagine action without this contradiction. It must, therefore, be right in God to cause it. Now contradiction implies error. Error, therefore, is a divine agent, and revelation is not a test of truth.

In the case of the two smiths, however, we may discover another truth. Let the two smiths represent men. Although men, as materials of the Divine artificer, require heating and cooling according to *His* purpose, they have no occasion to heat and cool themselves, to assert for the sake of assertion, or contradict for the sake of contradiction. On the contrary, their object is to remove contradiction, and effect conciliation. In this respect they act in opposition to the Creating Mind. The action of original Nature, or the Creator, is evidently antagonism—the action of man, or of wisdom in man, is to destroy antagonism.

Here, therefore, are two, or rather three forces: first, two opposing forces, originating in Divine necessity; second, a conciliatory force, originating in the resistance of man to a spirit of contention.

This latter is wisdom and virtue; but the smith must be kept working. He is never done. He never slumbers nor sleeps, and as long as he works he must have a hard and a soft, a cold and a hot, piece of metal in his hands. This contradiction can never cease. It may be infinitely varied. Sometimes the iron is red hot, sometimes merely warm. Sometimes both irons are cold, and he uses a file or a rasp; but in all cases there is an opposition of forces, and one material rules the other. Apply this law of Nature to mind, and you discover the universal law of antagonism, and the divine necessity of contradiction in the world of thought, beginning with revelation, which is merely a hieroglyph of all the rest. Having discovered this law of Nature, *abide by it.* Never deny it. Never forget it. Whenever you deny it or forget it, you blunder in reasoning upon all universal subjects, and the man who is guided by this law regards you as a wanderer in the infinities and mysteries of eternal night.

We will take another example, for the sake of a double illustration. Suppose two lawyers pleading a cause before a judge. Let the judge be man, and the two lawyers the antagonistic principle of the Divine Nature. Each lawyer makes a bold and reckless assertion that his opponent is wrong, and himself right. One adduces all the arguments *pro*, and the other all the arguments *contra*. The utmost zeal, vigour, and vehemence of language and action are employed to convince the judge that both sides of the question are right, each lawyer taking one side only. This double action is highly conducive to the discovery of truth. It is almost impossible in an ordinary case to conceal it. Were there only one party there would be no pleading, no inquiry, no exertion of mind, no development of intellect—there would not be two sides of a question. Two parties in opposition make a cause; the representatives of these two parties are the representatives of one cause, and the judge is the umpire. Upon the same principle has God divided himself into two parties, in order to make a cause, and by a double and *opposite* inspiration he pleads this one cause by opposite assertions, and man is left to judge by aid of

the spirit of wisdom which is given him. The action of Deity, therefore, in pleading is *contradictory*—in judging it is conciliatory, but as there are various degrees of judgment, the most perfect is that which is the most conciliatory, and best calculated to unravel the mystery of the plot.

Hence arises the philosophical necessity for Revelation appearing in contradiction. It is merely a one-sided pleading. The other side is as true. There is inspiration in both. There is inspiration in faith, and inspiration in infidelity. Truth is divided between them. Moreover, the contradiction is not between the two extremes only, but each is a mass of contradiction in itself. Faith contradicts faith, and infidelity contradicts infidelity, and revelation is set in antagonism to revelation—to infinity. There is no limit to the antagonism which is not confined to large sects and churches, but riots in individual contradiction, and sets even a man's own thoughts in confusion by the clashing of contrary ideas. This is the heating and cooling system. This is the system of antagonism. Is it not right? Then the laws of Nature are wrong. Let us repeal them! Let us send a petition to heaven to enact new ordinances, and put an end to antagonism! This very day a man called upon us with a petition of this nature! Yea, a petition to heaven for the coming of the Lord! He said, his wife had been praying for the coming of God's kingdom; and the Lord answered by voice, and told her to write out her petition, and, if she could get fifty signatures to it, he would come immediately, and would tarry no longer. The man is quite elated, and is, at this moment, going about with the petition for signatures. We happened to be out at the time he called, or we should certainly have signed the petition. The man and his wife have got one of the lawyers in their ears, and they are deaf to the other lawyer. Some people will not believe that the woman heard this voice. We never put ourselves to the trouble of denying or asserting these things. It is enough for us to say—*it is the lawyer*. That settles the point at once without any argument, and we settle the whole Bible controversy in the same manner, by seating ourselves on the bench as judges, unconstrained by external authority, threats, or internal fears.

This *all-sidedness* of the universal power is the source of man's *freedom*. All judgment is given unto man. No good law can come to man except through the judgment of man. A law given by revelation, vulgarly understood, is a sectarian law—a temporary law—a preparatory law—not a universal law. The universal law comes from within to every man, and is not imposed upon him by authority external—by miracle, voice, vision, or any other mode of olden revelation. When a man has found this universal law, he will be able to *read* revelation; but he will *merely* read it; he will not be subject to it, but subject it to the law of truth within him. He will treat it with suspicion, as a lawyer's pleading. Neither will he despise it; he despises nothing but false and evil modes; he never despises substances or facts. The evil does not exist in the substance, but in the mode of employing it. Evil, like fire, is a good servant, but a bad master. Evil must be ruled, not served. It is thus that old evils must be put down, but not destroyed, thus revelations all subdued, but not denied.

Is not this pure chemistry? Do not the chemists say, you cannot destroy any species or portion of matter? You destroy *modes* only, but substances are indestructible. Follow this chemistry in mind as well as in matter, and you will be sages, otherwise you are only citizens of Babel.

The evil created by this antagonism of the divine mind, is a law of Nature. It belongs to this life of necessity. How God may act in another state of being, it is impossible for us to conceive. We frankly own that we cannot imagine happiness without evil, but evil in subjection. Evil in subjection is happiness. Evil in ascendancy is misery. A state without evil is a state of pure passivity or inaction—an impossibility. This truth is *concealed* in the doctrine of eternal punishments.

As antagonism is a necessity of divine wisdom, it would be folly in us to try to determine how far it should go. Once acknowledge the necessity, and there can be no dispute about the limits. The necessity we think we have made evident to the most simple mind; hence it follows, that God is in wisdom necessitated to create physical, intellectual, and moral evil by

every variety of means, without an exception. His action must always be antagonistic in the first place, as a motive to activity in man, and conciliatory in the second place, as a motive to passivity.

This manifold and contrarious action is the characteristic of the Creator only, and inimitable by man. In man it would be vicious; but that which is a vice in man is virtue in God; for man has only individual actions to perform, but God is the universal actor.

The practical tendency of this doctrine is to remove sectarian animosity. Men will then be valued by their degrees of moral goodness, and not by their intellectual assent to a dogmatic proposition. Each man's God will be within his own conscience, and the mind being freed from the terrors of an avenging Deity will be more able to perceive truth, and ready to receive it as soon as perceived.

The sectarian god and devil are divine fictions, for creating a system of terrorism, and for fettering the mind. The union of these two principles simply removes the terror, and sets the mind at liberty. Of all the antique nations, the Greeks made the nearest approximation to this union of the two principles. The deception practised by Jove in the "*Iliad*," in sending Iris to deceive the king of men, is the exact counterpart of that which the Bible records, of the Lord sending a lying spirit to deceive the king of Israel. But the Greek poets played fearlessly with the idea. The Jewish prophets cautiously expressed it.

Did this fiction circulate merely as a poetical figure, it would be useful and beautiful; but, at present, it is plain dull prose, of very rude and portentous aspect. We admire it as poetry, and believe it must, for ever, be preserved in its poetic sense; but, in its prosaic sense, it must gradually die away, till at last it be recorded amongst the myths of antiquity.

THE OMNIVOROUS ANIMAL.

GENERATION AND REGENERATION.

To "the Metropolitan Society of Young Men for the Promotion of Moral Reform."

GENTLEMEN,—What I have to say to the public in general on the subject of the omnivorous propensity of mankind, applies so pointedly to the subject which you have praiseworthy taken up, that, by leave of the *Shepherd*, I shall especially address myself to you.

Your published circular states, that licentiousness, meaning thereby sexual vice, "stands forth in awful prominence, and presents to the view scenes of the most horrid and afflictive character." You call it the "dominant transgression," and, by various energetic phrases, the public is called upon to suppress the evil. But, throughout your papers and speeches, I seek in vain for any attempt to inquire into the causes, primary or secondary, of this great, widely-spread, living mass of error.

I hope such a course would not be discountenanced by you as too philosophical, which is another mode of saying, we would rather declaim year after year against the deplorable consequences, than seek to diminish the crime by an attack upon its fountain and source.

My view of the matter leads me to conclude that the source is nearer home, nearer to your homes than you seem to imagine. Nay, that it is at home entirely, and in the most sacred recesses of home, that we must seek the cause and the remedy of licentiousness. Aye, you will say, he is speaking mystically, and means the natural and entire "depravity of the human heart." Not so; for I have as much, or rather more, faith in the goodness of the human heart than in the evil. So that, for once, at all events, I speak literally what I mean.

It is a common observation, that if there were no receivers, there would be no thieves. The parallel case is equally obvious, and equally true, that if there were no customers there would be no courtizans. This is a crime with which you cannot peculiarly charge the poor.

Of the 80,000 prostitutes which you say that London, religious, moral, mercantile, chapel-abounding London, contains and maintains, a large majority evidently live in too expensive a

style to draw their income from the hard-working poor. The rich are no doubt great customers, but it must be from the middle-class, that order of life to which you and I belong, that springs the chief support of that kind of licentiousness which is exhibited in those dreadfully glaring results we so acutely deplore.

Police and medical records, if fairly investigated, would substantiate this assertion. Your papers seem at least faintly to express the same idea, though you do not follow it out. And why do you not venture to do so? Simply, because you yourselves are not willing to go one step really to abate the evil. You will talk, you will write, you will even pay, but all these are nothing compared to the real remedy.

Immediately, upon the primary cause, it is at present unnecessary to touch. That is a ground so capable of verbal contention, that we had better keep to secondary causes, which are so much less disputable.

If you agree with me, as I think you must, that unless there were buyers, there could be no sellers, you will also agree, that if there were no licentious young men, there would be no licentious young women. Then, let me ask, what are the conditions under which young men become licentious? Are there discoverable no means within their own control, which they have never yet controlled, or which those about them might favourably modify?

You profess to be acquainted with the fact, that children are "conceived in sin, and born in iniquity;" you know that to be true, both as offspring and as parents: yet it remains for me to ask you, what measures have you adopted in order to be placed under a different state of things?

Human improvement, in scientific language, regeneration with the religious, is an idea often in your minds, as a progress or a new nature, which is to be realized in you; yet, you go on generating from your own selfish will in a manner which totally hinders the regenerative operation. It is in your own legitimate marriage beds that one has to expose the greatest, the deepest prostitution, from which the inferior, but more glaring street-walking, vice emanates.

While the poor are breeding females to submit to the temptation of iniquitous wages, you are breeding males to tempt them with such wages. Having bred them from such a principle, you foster them in it by all the means in your power. Simplicity of life is bartered for multiplicity and complexity, quality for quantity, the serenity of happiness for the riot of pleasure. Purity in food, in lodging, in clothing, is abandoned for the exciting and the costly. To rear them better you feel that you must become better yourselves, and to give up any indulgence is more than you design by reform. All these things, you say, were sent for us—land and sea animals, wine, and other fermented liquors, tobacco, and every excitement is made to be used; for what else are they here?

Need I seriously oppose such arguments? It would be as easy to prove that the ocean was made solely for ships to cross, or ships were made to go to sea that men might be drowned, or that rivers flow through every land to invite men to suicide. We have so blocked up our intellect with the vicious application of natural productions, that we cannot see their true uses and end.

Thus, then, it seems resolved we are to go on. Unnatural, hot, exciting food, is to be the condition under which the only universal act, of which man is capable, is to take place. Children so begotten of course fall in with such practices; they seem even to require them; a new race is then generated, and thus the circle is completed. Then it is called right, because so it is.

Leaving out of question the impropriety of thus generating humanity, as well as of flesh-eating, look at the quality of the food you give your young men and women, and then say if it be possible to remain pure under such a regimen. Any honest butcher will tell you, that not one sheep in twenty is really sound, and the dirty feeding pig, whose Greek name *skrophos* indicates its disensing nature, is usually beyond all power of assimilation to sweeten. So it is with respect to other animals. Everything about us is of a piece with ourselves. The fields are so full of acrid plants, that neither milk nor butter is what it

should be, and even the careful are liable to fall into those errors which you lament, but do nothing to mitigate.

Then, to avoid one error, you direct us to another. "It is better to marry than to burn," you will tell us. Language which shows the author's meaning to be, that the best of all is to do neither. It may be better to commit one offence than another, but it is better to commit none at all.

I think I have shown, without entering on debatable ground, that there are physical, natural causes, sufficient to account for the physical and outwardly moral depravity we daily witness. We are born of human self-will—we are nurtured in pride and perversity—we explore every clime, every ocean, every department of nature, for palatable and exciting viands, adding fuel to fire, and when all these expand into broken hearts and ruined constitutions, we make a "Society for the Promotion of Moral Reform." And who are to be the promoters? The very parties who are neck-deep in these spiritual and natural immoralities. They are so at one with the external causes of vice that they cannot view them objectively. They who cannot separate themselves from the flesh-eating, &c., for one minute, so as to see the true bearings of the question.

How can such persons promote moral reform? How can moral reform be promoted in any person, who is thus unwilling to become a prepared ground for the reception of a better seed than is now flourishing in him? The obvious disgusting forms of vice can do little injury in the way of example; for the worst disposed mind must be unallured by disease and penury. The publicly approved modes of laying the certain unfailing germs of immorality deep in our generation, and of fructifying them in our development, are far more worthy of your animadversion and of your suppression. I say, we must begin where vice as well as charity begins—AT HOME. "Virtue crieth out in the street, and no man regardeth it:" nor should it be expected.

Trusting you will enter zealously into an attack upon this more hidden, but more important, strong hold of the crime of licentiousness,

I am, gentlemen, yours, most respectfully,

A MYSTIC STUDENT.

OWENIAN OBJECTIONS.

WE now return to our Owenian friends, to whom, we are sorry to say, we must soon bid adieu in our present capacity; but, before that *finale* arrive, we shall be able, we hope, to point out some important misconceptions, which will throw a little light upon the subject, to us so very simple, but, from false religion, and false infidelity, so sadly obumbrated by the teachers of the people.

In No. 173 of the *New Moral World*, dated February 17th, we find the following words:—"God being the governor of the world, is necessarily the final cause of all revolutions and institutions." This is our own doctrine, and the doctrine of the writer in the *New Moral World*. Here is an organic unity to begin with. This is the basis of all philosophy, and we are glad that the writer acknowledges it. Then, again, he defines God to be "the last result of speculative reason in the chain of causation, the final abstraction and probable essence of all the understood laws of Nature. Now, a Providence in this sense is both general and particular; and is, therefore, involved in every event, natural and artificial, national and individual." This is most philosophical, and clearly and beautifully expressed. This is the universal God as distinguished from the sectarian God. The sectarian God is a capricious God, who favours a sect, and is moved by prayers to alter his purpose. In all this we most devoutly agree, and only wish our friends to carry out these beautiful principles of Universalism, with the exception of their *probability*, which implies a doubt respecting the clearest and most axiomatic fact in philosophy.

Now, let us see how the writer reasons from this datum. Remember, he admits God to be the universal cause, the cause of our necessity of action. He then says, "But what is to be the practical effect of this kind of admission? Are we all bound to admit the truth and excellence of Mahometanism,

merely because it is logically providential, although no less truly forming a large item of human imposture and long-suffering? Yet Mr. Smith would appear to adopt his religion on a similar ground, and exhorts the Socialists by no means to give up special interpositions, miracles, and mysteries." And when did Mr. Smith ever teach that a doctrine should be received, or a precept obeyed, or an institution kept up, because it had a divine origin, or was supported by miracles? Never, never. All that Mr. Smith ever asserted is, what the above writer acknowledges, that it is divine, which infidels in general deny, to their own confusion.

But let us proceed to the answering of the question, "What is to be the practical result?" The answer is, "that unless we give up every thing that is not demonstrable, or capable of verification by the present experience of the world, we have no foundation solid or consistent enough whereon to build communities of united interests and harmonized feelings; that the divine commissioners of former times, kings, priests, heroes, and prophets, had not enough of practical wisdom to perceive the true means of forming the character to virtue and happiness; and that the Socialists, whose vocation it is to apprehend and attempt the carrying out of what they deem truly a divine commission, will be philosophically considered as ready instruments in the hands of providence, generated by the experience of woes that are interminable, except by the rational training of every individual from infancy to maturity, and guided evermore by the eternal, unchanging, and exclusive laws of universal nature."

This is the conclusion of the article, and still we are not opposed to it. There is a little more of the religious feeling in it than usual; and, therefore, so much the more beautiful and attractive. There is, in general, a philosophical accuracy about it, and were it not that the writer is writing against us, we would almost suppose that he was at one with us. But he is against us, and he must mean something in his opposition. What does he mean? He acknowledges universal providence. So do we. He maintains, that by carrying out the principles of Socialism, he is an agent of universal providence. We admit it. He says, "throw off every thing that is not demonstrable." So do we. "Every thing that is not capable of verification by the present experience of the world." So do we. Moreover, we say that if Owen succeed, Owen is THE MESSIAH. Now, does not the writer perceive, that if Owen succeed, we must be right, for this Messiah is the sum and substance, the very cream of revelation, typified under every ceremony of the law, re-typified under every rite of the gospel, and his advent announced under every guise of poetic and religious mystery. If Owen do not succeed, then the writer must be wrong. Succeed or not succeed, therefore, we are right, and the writer is wrong in opposing us. The success of Owen would only stir up the genius of Biblical commentation, to unveil to the world the resplendent typifications of the great deliverer, wondering at the same time how he, who was foretold as the Saviour of society, should himself be blind to the fact of his own divine commission.

We say most emphatically to the Owenites, "we cannot be wrong. Your practical success will demonstrate our philosophical truth, and you will then come to us to learn the elements of universal theology." But the query is, will you succeed practically with a false philosophical basis—an infidel basis? That's the point. Are you the people, or not? Are you merely forerunners of another people, with more consistent philosophical principles? We say, in your present condition of mind, you are not the people, because you are rowing against the stream of a universal religious feeling, and throwing off a demonstrable fact. Miracles have little to do with the question. Those who read the *Shepherd* carefully, know well that we attach no importance to them, although we regard them as natural means of an unusual description employed for erecting institutions which could not have been raised without them, and every universal mind will view them calmly in that light, and reject them as authority at the same time, inasmuch as they can prove authority only to the sectarian mind. True and false miracles are equal in our estimation, if they produce equal effects. We judge more by

the effect produced than by the cause. If *he* have organized society, that *he* is the organ of Deity so far as it goes. If it have formed one man's character it is a trifle. If it have formed a nation's character, it is of some importance; but, if it have run down the stream of time, and collected thousands of tributary streams—absorbed all progress and civilization—all art and science in its course, then we say it is *emphatically* the stream of humanity—the plan of Providence.

Jewism and Christianity are that stream. Mahometanism is not. The latter is a mere point in history—the work of one man with whom it began, and with whom it ended—the former are the *back bone* of human society, and they are spreading their spinal nerves over the whole world. But, if our friend can prove that Mahometanism is the stream of civilization and progress, and that it foresees and announces a new state of society and a social deliverer, then we become Mahometans, and go to Constantinople, and publish the *Shepherd* in the Turkish capital. But, as our friend will scarcely attempt to prove this absurdity, we are not afraid of being sentenced to this self-banishment.

The process of Divine Providence can never suffer a violent disruption. One stage is the legitimate successor of another, and the unity of proceeding must be kept up. Were Owenism to succeed by a rejection of the necessary connexion between itself and that which preceded it, the unity would be broken. The acknowledgment of the unity of this continuous chain of progression, from ignorance and evil up to knowledge and happiness, under the superintendence of Divine Providence, is tantamount to an acknowledgment of the divinity of Christianity, as the chief representative of the divine mind, up to the present time, and the divine embryo of a better church, which Providence will bring out of it by legitimate successorship. Upon these principles infidelity is an absurdity, whether miracles be impostures or not.*

* Paine, Voltaire, and others, foolishly imagined they could destroy Christianity, by proving miracles false, and the books inaccurate. This philosophy still takes with many simple people. Though every syllable that Paine has written against Christianity were true, we would still believe it. Though it could be proved that neither Moses nor Christ ever existed bodily, this would make no alteration in our principles. It is not in the men we believe, nor in the miracles, but in the effect produced in the stream of Providence. We yield the miracles to the religious world for the sake of peace; for they do not annoy us, but they seem to annoy the infidels sadly.

ANSWER TO A RADICAL CORRESPONDENT.

AN anonymous correspondent has sent us a critique upon the *Shepherd* and its contents, requesting us to insert the best, if we can discover the best, of it. We shall endeavour to embody his complaints and our answers in one. Much of his letter we agree with, viz., that the subjects of the *Shepherd* are in general beyond the working man, and not suited to the people *en masse*. A newspaper is the only publication which can give general satisfaction. The *Shepherd* is not a newspaper. Next to a newspaper, the most interesting publication is a collection of stories and scientific paragraphs, embracing a large amount of information in a small compass. The *Shepherd* is not such a publication, and never was intended to be such. Had we made such a miscellany of it, it might have paid its own expenses, and a little profit moreover, and given no offence, because it would have expressed no opinion on politics or religion. But it never would have changed the minds of individuals upon religious subjects, as our Correspondent confesses in respect to his own case. It is evident, therefore, that we did not intend the *Shepherd* to be a work that catered for ordinary minds, and steered its course by popular caprice.

The writer then goes on to rail against laws and law-makers, tyranny of rulers, and indifference of the people to their own rights, and intimates that even a little bleeding, independent of moral means, would be useful in causing the great leviathans to disgorge what they have devoured. We are not disposed to deny the truth of what he says, if he allows that a little blood-

letting is also necessary to make the people mend their manners a little, and come to some understanding about what they want, and the best means of obtaining it. Both parties seem to us to be in a highly feverish and diseased state, and for this very reason we think bleeding as useful for one as the other. But there are plenty of papers without the *Shepherd* to abuse the rulers and the laws, and stir up the people to strikes and revolution, and men of mettle besides, Colonel Thompson for one, who will please the ears of the most enthusiastic, by allusions to the gallows, the block, and the hatchet. When the people are unanimously of opinion that the hatchet should be used it will be used, and when they have satisfied their thirst, they will go back to their workshops and their gin-shops, and leave the aristocracy to rearrange and re-distribute their productions as formerly. So did the French, and so will do the English, whenever they receive the spirit of blood, and march to reform under the banner of the Lord of Hosts. We do not dispute the right of the people to do this. The people are responsible to no earthly power. They have a right to do as they please; yea, even to hang themselves should they think proper, but we should be very sorry to advise them so to do; because we are well aware that *the mass* would suffer by any political convulsion, and the aristocracy would almost all find some means of making their escape.

But what have the principles of the *Shepherd* to do with the people's folly, and the proud man's oppression? When did ever our principles rule society, or inspire the populace as a body? The people have produced their own condition. They are the same now as they were a hundred, a thousand years ago, always clamouring about trifles, always combining for local ends and small purposes, and always producing evil whether they succeed or fail. And are we to minister to their folly by humoring this party, and not offending that, and encouraging a third, and abetting a fourth, and backing a fifth, and stimulating a sixth, all in opposition to each other? The only philosophical method is to clap them all together, and determine the universal object by that which prevails in all, and which can most consistently be reconciled with the object of all. What have we to do with the Poor Law Bill, or its repeal, when we know that any bill would prove a curse, and no bill at all would prove as great a curse? What have we to do with the pension list, or tithes, and church-rates, or any other such paltry question, which is merely a *pecuniary* matter, and which is not a vital question of well-being, *unless* connected with some moral or regulating principle of mind which shall subdue the vicious passions of men, and reconcile them to the universal laws of God and Nature, and also to one another? We do not know what particular good could be gained by universal suffrage, the abolition of hereditary peerage, the abolition of the laws of primogeniture and entail, the repeal of the corn laws, and other popular measures, if sectarian zeal and money-hoarding propensities were *unrepealed*. We are positively favourable to the repeal of all those laws, but there are numerous active and agitative publications engaged in the crusade against them, upon whose labours we look with satisfaction, and whose various talent supersedes the necessity of our co-operation, more especially when all these are entirely overlooking the original root of the whole mystery of iniquity, which really lies in the false notions of the people upon religion, morals, and association. As for laws and acts of parliament we care very little about them. They are produced at the rate of five or six hundred per annum, and are so numerous that no lawyer ever read them, and the country knows nothing about them, and those which are generally known are ephemeral,—they are productions of yesterday, which have not formed the people's mind, and are only instrumental in quickening their passions. But religion, morality, and social science, are as old as the mountains, and being hitherto falsely viewed, and one-sidedly adopted by the people, and being, moreover, the basis of all public conduct, we regard it as more conducive to the popular good to work at the root than haggles at the branches. Just look at the power of sectarianism, and the amazing increase of churches and chapels within these last ten years. There never was the like of it known in this country, and yet the people are becoming less religious. What is the cause of this? The one-sidedness of the infidel attack has roused the spirit of opposi-

tion. It is one false doctrine fighting against another; but each is resolved to overcome. The weakest, however, as usual, has gone to the wall, and the battle will last for ever, and all the politics connected with the principal topics will for ever remain unsettled, in spite of revolution, blood-letting, and law repealing, unless the fulcrum be found which will balance the two extremes. The repeal of one law, and the enactment of another, is merely a shifting from one scale to another. A republic is only a monarchy, in which tradesmen and merchants supply the places of hereditary aristocracy, and where the field of conspiracy and extortion is extended by making merchandize the sole means of rising to affluence. All those who know America know the baseness and sordidness of its citizenship, and the reverence and humiliation with which it looks up to a British aristocracy. America has not found nobility of mind by destroying nobility of rank, and its wealth consists in its youth and its back settlements. Youth and back settlements we can never have, unless the sea should retreat, or some rare geological phenomenon convert our little island into a fifth quarter of the globe by a marvellous eruption of dry land. Republicanism we may have, but are we to have the sordid self hunters—the cursed love of gold, and family possessions along with it? Then we care not for it; we would not give a pancake, or a crust of bread and cheese, for it. In less than twenty years it would be null and void, and our freehold citizens would be vying with each other who should first enjoy the benefit of transportation beyond the seas. *The love of money is the root of all evil.* Destroy that curse, show us a mode of destroying it, and we are with you. All within that first, and last, and indispensable measure of reform, we look upon as matter of minor or local importance. Its destruction is intimately connected with the elementary principles of religion and morals, those very subjects we treat of, but which, not directly bearing upon vulgar politics, our Correspondent cannot see the use of. Can he see the use of the political wranglers? What are they doing? and what can they do? Their doings will *tend* to good, but final good can be accomplished only by universal principles.

As for the metaphysics, they are written for a party who appreciate them. There are minds who enter into such subject, with zest. They are not for the mass. But, as all thinkers men have metaphysical principles of some sort, and as all moral and religious questions turn upon metaphysical propositions, they are of immense importance in fixing men's principles. All universal principles are fixed upon metaphysical points, vulgar politics are not; but vulgar politics are of no use until they come to universal principles. Either the people or their leaders must come to these principles. The Transcendentalist's letters are exceedingly conclusive in showing that Materialism, as a starting point of philosophy, is a fallacy. Were the infidel section aware of this they might save themselves much trouble, and narrow the breach between themselves and the religious world. As they now reason they are creating immense mischief and unquenchable hatred.

Our Correspondent also ridicules the letter of a Universalist, a working man, if we mistake not, and one who used to correspond with the Transcendentalist, and think deeply on his letters. He says the idea of a working man saving 5s. a-week is absurd, because the saving is impossible; that not five hundred men could be found able to do it, inasmuch as not a shilling is left at the week's end to spare for any purpose! We inserted a Universalist's letter because we respect the writer; it is the first of his we have inserted, although we have received many from him. We are not responsible for its contents; but we certainly deny positively the *fact* of our anonymous friend, that not five hundred men could be found capable of saving five shillings a-week. We have no hesitation in saying that 500,000 could be found in Great Britain to do this for an urgent purpose. We know many who snuff 2s. 6d. a-week, but perhaps this is a necessary of life! There are many in London who account themselves sober men, and drink 7s. a-week. This is a comfort, and could not be dispensed with! Such men have not a shilling left at the week's end we allow; but to affirm that they might not have it, is rather presumptuous. When Mr. Cousins, the publisher of the *Shepherd*, was a journeyman, he resolved to save one-half of his earnings, and live on the other half, what-

ever it might be. He kept his resolution. He bought his type by handfuls, and now he has type sufficient to keep three weekly publications in constant circulation, with a large amount of surplus type sunk in sheets of different descriptions. Every printer knows that this requires a large stock of metal. Yet Mr. Cousins began with a resolution, a *metaphysical point*; that point saved half his earnings; half the earnings bought the type in handfuls, and now he has a well furnished printing office, capable of producing the largest weekly newspaper in London. Compositors' wages are the same now as when Mr. Cousins made his resolve and accomplished it. There are more than five hundred compositors in London capable of doing the same, if they had the resolution. It is the metaphysical resolution only that is wanting with many. God forbid that we should ever affirm that hand-loom weavers are capable of doing this, or that agricultural labourers can do it. These men are sorely depressed, but these are the very men who cannot strike, who cannot combine, and whose condition is forgotten because they cannot make a stir. A universal combination would include them. A local combination excludes them, and makes laws to prevent them from sending their starving offspring to a more profitable employment. For this reason we dislike local combination, and long for a universal association; but how to get a universal association without this metaphysical point—this firm resolve to begin with, is more than we can tell, and when it comes it will not waste its energies upon local trifles, but redeem the parts by the regeneration of the whole.

Our Correspondent reminds us of having once said in the *Shepherd* that land could only be purchased by conquest. We were reproached by a gentleman soon after for that saying, and promised to give an explanation, but forgot. The people will conquer whenever they are unanimous, or whenever a majority is unanimous that majority will soon prevail. They will accomplish any object by dictation only, whether it be the acquisition of land, or the organization of systems. This is the conquest we mean. But should resistance by a minority then be presented, the employment of physical force would be perfectly justifiable. But, in the meanwhile, the unanimity of the people must manifest itself. This is the very beginning of the process. Where is this unanimity? We see very little proof of it. The English people are at variance with the Scotch, and the Irish with both, and all the three with one another—each man, with his petty notions about parliamentary bills, and each leader abusing another as a renegade and an enemy of the sovereign people. Under such circumstances physical force is murder and robbery.

TO THE EDITOR OF THE SHEPHERD.

SIR,—As you have, in a late number of the *Shepherd*, given an interesting extract from "Wilkinson's Manners and Customs of Ancient Egypt," I have sent the following extract on the same subject, which may be equally interesting to your general readers, copied from the "Foreign Quarterly Review" of April, 1836.

CHARLES DYER.

We do not concur in all the ingenious evidences brought forward by Sir William Drummond, respecting the practical information in the whole circuit of art and science which he assigns to "Egyptian wisdom;" many of his allegations, however, are borne out by Rossellini's visible testimonies of the practical knowledge possessed at the era under review. We have the proof that they not only made glass, as he surmised, when speaking of the supposed telescopes of the ancients, but stained and gilded it in imitation of precious stones. Neither are we rashly compelled, by the fact of the inadequacy of modern mechanical knowledge to raise and locate the enormous masses of masonry employed in building their temples, to jump at the conclusion, as has been done, that the power of steam was known to the Egyptian ages; and that there is no other way of accounting for the effectual operation of the three banks of oars employed in vessels carrying a larger complement of men than our men of war. We are not even induced to adopt the conclusion, by the obvious appearance of wheels, pulleys, paddles, and machine cases, which, on the monuments,

appear somewhat unintelligibly attached to the Egyptian vessels of war. It is, we grant, difficult to account for the apparently gratuitous exaggeration of Homer, respecting the Phœnician ship which conveyed Ulysses to Ithaca having a self-motive power, impelling it towards its destination without the aid of seamen, oars, or sail, unless he had seen some such vessels during his travels in the land of Egyptian science, or elsewhere. His description would certainly apply to a steam vessel. This, however, is certain: Rossellini proves that, so far from making any extraordinary advance in the arts contributing to the splendor or comfort of society, we have yet to recover the *artes perditæ* known to the Pharaohs of the dynasty to which we refer, or to their associated universities of learned men. There are many effects of art which the Egyptians at this time produced, and which we are not capable of accomplishing. Some rest on contemporary evidence; others are demonstrated by the palpable evidence brought before our eyes by Rossellini. We see the sculptors in the act of cutting the inscriptions on the granite obelisks and tablets; see a pictorial copy of the chisels and tools with which this operation was performed; but our tools would not cut this stone with the precision of outline which the inscriptions retain to the present day; setting aside the lost art of hardening copper implements and instruments of war, what means had the Egyptians of hardening their iron or steel implements for the purpose in question? We have at all events lost this art. The same arguments may apply to some of their cameos and intaglios, with this addition, which confirms the preceding astronomical inference, that the minute delicacy of their details could only be effected by means of a microscope. We could not produce them without its aid. Other "lost arts" in metallurgy may be evidenced by the well-known fact that the Hebrew legislator inferentially ascribes to the Egyptian chemists the art of making gold liquid, and of retaining it in that state; this we have not the power to do. The productions of the goldsmiths and silversmiths of Thebes are exhibited by Rossellini, and they fully demonstrate the high pitch of refinement to which they had brought the working of the precious metals. Rossellini exhibits gold and silver tureens, urns, vases, banqueting cups, &c., of the most exquisitely beautiful workmanship, and tasteful as well as magnificent forms. In surveying them, the classical reader will be convinced that Homer drew little on his imagination in describing the gifts of plate made to Helen by the wife of the Egyptian King Thone—possibly one of this very eighteenth dynasty, or a contemporary sovereign. But Homer ascribes still more extraordinary wonders to the goldsmiths of the same time. They must have succeeded in uniting the most skilful clock-work with the workmanship of gold; for he describes golden statues, thrones, and footstools, moving about as if instinct with life. We could effect this result at the present day; but at all events it demonstrates that we have not made much progress in the art of working gold since the magnificent Egyptian era, of which Rossellini gives the most striking and minute details.

It is a triumphant evidence of the exquisite taste of this line of monarchs to which we refer, that we have made little, perhaps no improvement, on the forms of the vases and vessels to which we refer, and that an Egyptian beaufet or sideboard, with all its details, not excluding dishes, plates, knives, and spoons, near four thousand years ago, bore striking resemblance to the sideboards of our modern palaces and villas; the hunting cups were embellished, as at present, with heads of the animals of the chase; but the banqueting urns, instead of being supported by the forms of vanquished Carians, i. e. Cariatides, as at Athens, are supported by the forms of vanquished Bactrian, Chaldean, Scythian, and Ethiopian kings.

But there is a more singular proof—the inventive genius of the race of kings, who, according to our view, founded social order and civilization on the wreck of pastoral community "of goods." Not the slightest improvement has been made in the tasteful forms of their household furniture down to the present day. A curious inference grows out of this fact, the truth of which any of our readers will at once admit, by throwing a glance on the superb chairs, couches, sofas, footstools, tables, and beaufets, exhibited by Rossellini; it is this, that the luxurious custom of squatting on ottomans, which now prevails over

the East, and of dining inconveniently from trays placed on a low stool, is a much later invention. The Egyptians of the remote age in question evidently sat as the Europeans now do, and employed their tables in the same masculine manner, avoiding the effeminately recumbent position employed by the Romans at their dinners. Rosellini adds to this information, the still more curious exhibition of all the details of an Egyptian upholsterer's workshop, between three and four thousand years ago. We see all the forms of household furniture under the progressive operations of the workman's hand; the cutting and turning implements by which they were made; the joining and gluing of the parts; and the acts of polishing them, when complete, with pumice-stone, or of gilding and adorning them with stuffed silken cushions, like the modern. This exhibition of the details of an Egyptian upholsterer's workshop, is only a counterpart of the details supplied by Rosellini of all the other trades and manufactures of Egypt, and which, in all cases, possess the same minutely accurate and curiously attractive character. Our space, and the necessity of touching, before we conclude, other more important contemplations and more serious associations, preclude us from following up this sketch of the art and trade of Egyptian upholstery, by an equally succinct and interesting account of all the various trades and processes of manufacture, which existed in Egypt eighteen hundred years before the Christian era. For all the information necessary to complete the subject in a pictorially descriptive point of view, we must refer our readers to the arranged series of the trades and manufactures of Egypt, as set forth in Rosellini's illustrations. We have no hesitation in declaring, that, not only a very interesting, but a very accurate work, on "Egyptian Trades and Manufactures," at the era we speak of, might be derived from the materials furnished by Rosellini.

INQUIRY INTO THE RELATION BETWEEN FAITH AND KNOWLEDGE.

By the Transcendentalist.

ESSAY V.—AND LAST.

In the first of these essays, it will be remembered that I divided mankind into four classes:

| I. | II. | III. | IV. |
|-----------------|---------------|---------------|-------------|
| The uneducated. | The educated. | The inquirer. | The knower. |
| | Non-inquirer. | | |

Now, these names may represent not only classes of distinct individuals, but also the progressive states of one individual. Every "knower" must have passed through the three previous categories. He was first uneducated as to his science, and, as all reasoning proceeds from premises, the result of his education must have been to furnish him with these. But not only does it give him principles, but also a number of propositions, which are not to be used as premises, but into the truth of which he is to inquire.

As every proposition of Euclid is in itself a little science, and the 15th was used as an instance, we will again suppose its investigation the object of the scientific man.

From being uneducated, that is, knowing nothing about the matter, he becomes educated, that is, he reads the axioms, definitions, and previous theorems, and also the proposition itself. He is now furnished with premises, and with a subject-matter for investigation, or, as it is called by logicians, a thesis. It must be remembered, that the conclusion of a syllogism is generally the first proposition given, and then the student considers with what premises he shall prove it. He rarely begins with laying down two premises, to see what result will turn up.

The student is now an educated man; he has his thesis, and his materials for proof. Of course he must, for a moment, be a non-inquirer; but, how long will he remain such? If he be really a "student," an act of the will must bring him into the third category. He is now an inquirer; he is reading, but has not *read through* the demonstration. Having gone through, and understood it, he is now in the fourth category; he is a "knower."

Let us now turn to our third essay, (in No. 33,) and see what faith is, as distinguished from the mere choosing between probabilities. We shall find that the word stands for a LOVE

to one side of a question. The religious enthusiast *loves* the doctrine contained in certain propositions; he will often assent to a thesis, and absolutely refuse to inquire into its proof, lest he may "shake his faith."

What connexion is there between the warm enthusiast who takes for granted certain theses, and the cold mathematical student who takes nothing for granted? Here comes the question before us: is it possible for knowledge to be without faith?

The mathematical student is not bigoted to a peculiar result of his investigation; he would not be unhappy whether a particular thesis turned out to be true or not, but there is one thing about which he is anxious,—the discovery of the *truth*. Whether this or that be true or false is of little moment, but take from him the possibility of discovering *truth* altogether, and he will be miserable.

We believe, that by pursuing a certain course of study, he will arrive at a number of truths, and this is no mere cold belief, resulting from the weighing of probabilities. Many of the non-inquirers will have such a belief; they will have seen students attain their object by a certain course, and hence will believe that, by pursuing this course, they also might arrive at a like result. But they are indifferent; they will not take the trouble of investigation; they have no *love* about the matter—theirs is a dead, not a living faith. The sedulous student is far from cold; his warmth is concentrated in one object, and as this is not an object desired by the multitude, they esteem him cold, because he takes no interest in matters which they consider important. A zealous mathematician would detest a man who, not from mere ignorance, questioned the possibility of attaining truth by mathematical reasoning, as much as a Methodist would abhor an infidel; his *axiom* is, "Certain truths can be learned by mathematical investigation"—a proposition, which he not only believes, but *loves*.

It is this act of the will, this love, this living faith, which carries the student from the second state into the third, and then through the third to the fourth. "Faith is the evidence of things not seen," ay, and the student has faith that by striking into a path he will arrive at the truth, though that path is as yet obscured in mist. Observe the axiom of Spinoza, whose zeal after truth none will question, however they may dislike his peculiar doctrines: "*Idea vera debet cum suo ideato convenire*" (a true idea ought to agree with that of which it is the idea). Upset this proposition, the truth of which many will doubt, and down tumbles his whole system. This system was constructed not only by his intellect alone, (mere intellect cannot act,) but by his will in conjunction with his intellect, and probably he would have hated a doubt of his axiom.

Faith, then, in the student, is the firm belief of a something beyond the sphere of his present knowledge, attended with a burning desire to bring that something within the sphere. His longing is directed towards the undetermined, which he longs to determine. In the belief of a something beyond knowledge the student and the religious enthusiast are alike, but they differ in this,—that the faith of the former prompts him to inquiry, while that of the latter checks him from it. The fact is, the student's faith is confined to certain very general propositions, such as, "Truth, though not attained, is attainable," and so on, while the religious man believes in very particular propositions. Even the student may dislike inquiry into his axioms—an experimentalist often hates a metaphysician.

What has been the result of these essays?—The following aphorism: There can be no knowledge acquired without faith. That there can be no faith without knowledge is obvious, as the believer must at least *know* the existence of the propositions he believes.

Again, we find an illustration of our maxim, that reality is the confluence of two opposites. Faith and knowledge are often put as contraries, yet we find that the scientific man without faith, and the man of faith without science, are mere abstractions, and never existed.

Before we dismiss the subject, let us look at the three last categories, "the non-inquirer, the inquirer, the knower," or—the passive—the active—and the passive again. Why are the first and last man passive? Because they are dead? No!

Because they are directing their energies to something else. The student may cease to be a student, but it is the condition of his existence that he shall direct his energies to some point. Here we find that the "passive" is a mere abstraction, and that real existence is the flowing from one passive state into another, which two states vanish directly we try to contemplate them, and have merely a logical being.

However, there is an inactive sort of activity, like that of a horse in a mill, who goes through the same objects over and over again, which is distinguishable from that of a noble mind that dashes forwards in a straight line, and ever seeks to add more to its wealth. Men of the latter sort of minds alone are great, the others are sluggards, or at best, industrious "mere men of business." To students there should be one word, that of Blucher—"FORWARDS."

THE TRANSCENDENTALIST.

P.S. I shall write one more paper, containing practical aphorisms for philosophical students.

TO THE EDITOR OF THE SHEPHERD.

SIR,—Believing that a new system of society can only spring from principles contained in the old, I have looked upon the endeavours of men to invent, contrive, or prop up any favourite system impossible. According to the doctrine of the *Shepherd* there needs a uniting principle for any great movement in society; and in no pursuit are men so likely to unite as the acquirement of wealth. Money has frequently been said to be the root of all evil; but the time is coming when it will be found to be the source of much good. The labours of philosophers and philanthropists to discover and put in practice a system, the operation of which shall destroy poverty, and bring within the reach of every industrious member of society a sufficient supply of the necessaries and comforts of life have failed, and their works have done no more than show us the necessity of a better system. The system of Owen, Fourier, and Plato, have something stagnant about them, and the human mind would be disgusted by constrained luxury: desiring liberty, be its consequences good or evil. That system which will redeem mankind must be of divine growth, and not of human invention. It has already begun to spring up amongst us: but, like many other good things, has been abused and reprobated. The principle to which I allude, is the funding of money; its extension to most of the most civilized nations of the world, makes it an object of universal attention. Governments have used it for the accomplishment of their purposes, and now it is about to be used for the benefit of mankind, both collectively and individually. Its application to commerce and manufactures will absorb the greatest portion of the capital of society, returning an annual interest to the many, instead of immense profits to the few; thereby facilitating the exchange of labour for labour, without the impediments of profit-mongering, at the same time preventing the creation of extremely wealthy individuals. Capital will then be derived from quite a different source to what it now is. It will be the joint accumulation of labour and talent; whereas it is now the product of individual craft. When the larger class of capitalists shall perceive the waste of labour, and the destruction of capital, which is the consequence of individual speculation, they will turn their attention to plans of a more general and universal tendency, amalgamating the different branches of a manufacture into one concern, destroying the profits on each separate branch, and substituting a smaller rate of profit on the whole, thereby sending their goods to market at such a price, as shall defeat the competition of smaller capitalists.

The smaller capitalists being unable to use their money to advantage, will unite and form companies to carry on trade upon the principle of an annual interest on the sums invested, thereby totally destroying profits, and with profits all individual accumulation, except that produced by labour, which can never amount to such an extent as to produce evil. Labour then will be paramount to capital, it being impossible to produce capital any other way than by a subscription of the labourers. Then will industry and prudence reign on earth,

and poverty be justly despised as the mark of idleness and profligacy.

The desire to draw your attention to the effects produced by the combination of capital, has induced me to trouble you with this letter, hoping you will excuse all defects.

I am, Sir, your grateful reader,

J. C.

COMMUNITIES.

The following paragraph is from the *Literary Gazette*, in a review of "Cooper's Excursions in Italy":—

We have concluded, but are tempted to add, as it were, a postscript—a suggestion for the benefit of the poor and lower classes of the community, which we think well deserving of general attention.

"What a charity, for instance, would a plan something like the following become!—Let there be a company formed to erect buildings of great size, to lodge the labouring mechanics and manufacturers. Such an edifice might be raised on arches, if necessary, with composition floors. It might enjoy every facility of water and heat, and even of cooking and washing, on a large scale, and, of course, economically. The price of rooms could be graduated according to means, and space obtained for the exercise of children in the greater area of so many united lots. Even entire streets might be constructed on this community plan, the whole being subject to a company police. Here, however, the community principle should cease, and each individual be left to his own efforts. America may not need such a provision for the poor; but Europe would greatly benefit by taking the practicable and rejecting the impracticable features of the Owen System. Among other benefits, there would be fewer fires."

ABSURDITIES AND NON-ESSENTIALS.

THE most absurd religions are the most popular or universal. Nothing can be more absurd than the mummeries of Catholicism, yet Catholicism is the rule, and Protestantism the exception. Church of Englandism is but little removed from Catholicism. Church of Scotlandism has little mummery of form, and is the smallest Church of the three, having probably less than 200,000 communicants. As you approach to rationalism you find the numbers diminish and the confusion increase.

Again, as to non-essentials, these are the most gregarious or attractive of all subjects. Visit Exeter Hall daily, in the month of May, and you will find abundant evidence of this. Visit an exhibition of the fine arts, and see the crowds of ladies and gentlemen, actually crammed almost to suffocation, and paying money wistfully, to witness the pleasing productions of fancy. Few of these individuals ever visited a factory, or a mechanic's workshop, or a public meeting for political purposes.

It will be replied to this, that the class of people visiting those places is already provided with essentials. This is not strictly true, especially in respect to the churches; but, admitting it to be true, what is the inference? The inference is, that whenever people are provided with essentials, they look after non-essentials. To collect all classes, therefore, you must provide essentials for the Materialists, and non-essentials for the Spiritualists, otherwise the latter will oppose you, and powerful opposition, verily, you will find it. You will find that absurdities and non-essentials will array all science and art in their cause, and play fearful havoc with common sense.

The above distinction is curious, but true, and of universal application. The essential, like the prose writer and artisan, is at the bottom; the non-essential, like the poet and artist, at the top.

CORRESPONDENTS.

We have written a private letter to F. Wilby.

ANALYTICAL CHART OF UNIVERSAL JUSTICE, TRUTH AND PEACE.

In the following page we have drawn up a chart of Universalism, which we mean to publish on an open sheet, that we may present to the eye, at a single glance, the principles of justice, truth and peace. Avoiding the two extremes of spiritualism and materialism—the first of which speculates on the organic principle, without the organism—and the latter, on the organism, without the organic principle—we present both these aspects in one—a double unity.

Of the organic principle, which, in its universal sense, means the Divine will, we can merely acknowledge its necessary being, and the entire dependence of all physical existence upon it. It is in the organism or manifested wisdom in creation alone, that we can discover the laws according to which he regulates his movements. These laws are abundantly clear, and there is a remarkable unity or harmony in their infinite variety. In them, we perceive the reflex idea of God, otherwise unperceivable to the human mind.

We do not profess to know any thing but through the medium of sensation, and we do not attempt to express any but scientific truths. Science is the sphere of language. Language cannot go beyond it. Even a feeling cannot be expressed without the aid of science—for grammar itself is a science. The feelings of a dog are very strong. Its affections are superior in intensity to those of many human beings; but the dog has no speech, not because it has no feeling, but because it has no science. With science, a dog may be taught to read and write, but no additional amount of affection could teach it the difference between an interjection and conjunction.

But, although the feelings cannot speak immediately, they inspire the intellect; and, when the intellect is well trained in the knowledge of the divine law, it becomes an excellent attorney for the central spirit of all conscious being, viz., desire. Desire or love is dumb. It is the mystic's "being"—the spring of life, but it cannot manage its own affairs. This is the principal reason why mystics are unintelligible. They have a living truth at the foundation of their doctrine, but in attempting to do without other living truths, Nature rebels, and maintains the rights of her intellectual offspring. The laws of God must be obeyed.

We believe that all universal truths are simple and intelligible, and that error, in the same extensive signification, is unintelligible. We are, therefore, perfectly willing to submit the following chart to the test of the imagination or the judgment, separately or conjunctly. We believe it to be so perfectly correct, that it is impossible for a man even to imagine it to be false, and systematically arrange his ideas upon that supposition. We have frequently challenged people to confute us by imagination. The power of universal truth is such, that the fancy itself has not the power to invent a rival, and, at the same time, embrace all being.

As for the intelligibility of the following mode of representing truth, we have tried it with boys, and found it successful. Any boy of fourteen may understand it, and when once understood, we should have very little fear of that boy ever being perverted in mind by any species of bigotry, either infidel or religious.

Morality, however, comes from another source. It is the offspring of that *dumb* principle of love to which we have alluded. It is feeling reduced to action; and, therefore, we do not pretend to say that a man, by merely understanding the modes of truth, becomes thereby possessed of the spirit of virtue. But, as the feelings are intimately associated with the understanding, and, as a bigot's feelings are always arranged on the side of his bigotry, it is very evident, that, in so far as you cure the bigot's understanding, you cure the bigot's feelings. Every man, therefore, who understands, and receives this chart, becomes necessarily a better man in his social capacity.

But this understanding is not enough to cure him. Many of the feelings are very remotely connected with the understanding. These will not be sensibly affected. Something more is necessary than the understanding of modes of truth. Something more *common* than understanding. This is what the Mystic calls his divine nature—God in the soul. But this is very vague. God acts differently in different souls. There are no two souls alike. A man's God may be a standard to himself; but God, in mankind, is the standard for all.

To discover this latter standard, outward forms and manners are the medium. We judge of each other by actions and words, and we love and hate each other in relation to actions and words. The greater proportion of our actions are artificial inventions for creating good or bad feeling. Politeness is a social invention for the creation of good morals. It is useful. It might be extended to public affairs and social forms. If so, it would induce kind feeling; and this is the source of morality, and it is produced by *dumb education*, that is, by pleasing modes and forms of social intercourse. We cannot love that which is unlovely. We must, therefore, create lovable forms and manners in order to enjoy the sensations of love. Now, the use of the following chart is to point out to the understanding the mechanical means, physical and doctrinal, by which the desires of a benevolent spirit may be gratified.

We do not profess to regenerate men, individually, upon more than one hemisphere of their being; that is, their intellectual. We destroy bigotry, and give them universal views of creation. But the moral nature cannot be perfected without social arrangements. Language cannot do it. Common actions only can do it. The priests of religion have attempted it by words, but they have only made sectarians. The mystics try it by words, but the effort is too great for ordinary zeal and ability. We merely direct the mind to the only mode by which men, collectively and individually, can be permanently improved, beginning with the understanding as the agent to accomplish the end, for Desire is already in every man to attain the end, and waits only the verdict of his intellect respecting the means.

Our doctrine is the intellectual offspring of peace, and its offspring is peace.

N.B. Some of the terms which we have employed are not altogether satisfactory; but we believe the language cannot furnish better. By *organic principle*, we mean the organizing or formative principle. By *inorganic principle*, we mean a principle which has not the power of producing an organism.

ANALITICAL SYNOPSIS OF UNIVERSALISM.

UNIVERSAL BEING,

OR

(ORGANIC PRINCIPLE.)

GOD AND NATURE

(ORGANIC FORM.)

AN

ETERNAL UNITY,

WITH A DOUBLE PRINCIPLE OF ACTION MANIFESTING ITSELF

By ANTAGONISM

In religion, as the two principles of good and evil—God and Satan—In science, as positive and negative agents—In politics, as powerful and weak—In the whole, as goodness, wisdom, and power—In the parts, as evil, folly, and weakness. No action, no life or movement, can appear, till this analytical disunion of the Divine Nature be dramatically effected.

THE UNIVERSAL GOD DRAMATISES HIMSELF AS

GOD (PARTITIVE) VERSUS GOD (PARTITIVE).

This partitive view of Deity is very different from the universal. God, in the partitive sense, is the leader of a party. In this capacity, he acts like his agents in the material world—one-sidedly. The positive agent in matter is distinct from the negative, and the negative from the positive, although both belonging to the same principle. This distinction is necessary for action. To produce a corresponding action in the world of thought, the Deity has divided his name and nature into two, and in these two capacities he has acted two distinct parts in one personality. God is the name which the Divine power has, in its partial manifestations, assumed as the author of revelations and religious faiths. But he has never founded a faith without, at the same time in his negative character, or Satan, establishing a rival system. Both systems have the same source. Both contain partitive truth; and the divine mind, like a counsellor for each side, urges on the tide

of contention in man, till every possible view of the subject be taken, and ultimately both parties coalesce. The coalition takes place by discovering that truth, like all physical agents, has a positive and a negative side; that the positive is not the whole, nor the negative the absence of, truth; but, that the distinction is a sexual distinction, which causes man, in ignorance of the double nature, to see one half as false, and the other half as true. It is thus with all universal questions, or questions relating to first causes or primary laws—such as liberty and necessity, good and evil, faith and works. They all resolve themselves into sexual pairs, which are individually true, though decidedly opposed to each other. This *pairing* is the natural cause why the God (partitive) of revelation can speak both affirmatively and negatively in respect to one proposition, and give the consciousness of rectitude to two opposing parties.

As a whole, the above process is organic, tending to
PEACE.

THESE TWO OPPOSITE, BUT UNITARY, PRINCIPLES HAVE TWOFOLD DEVELOPMENTS;

1st. CONCURRENTLY IN SPACE.

Positive and negative principles are the elements of all chemical action, *e. g.*, acid and alkali, heat and cold; of all intellectual action—as affirmation and negation; of all moral action, as love and hatred. Each of these is good or evil to man *relatively*. Love of evil is vice. Hatred of evil is virtue. All is good *absolutely* in universal Being. This concurrent antagonism takes place also in politics, science, and religion—in the exhibitions of party spirit. The bipolar law is universal.

2nd. SUCCESSIVELY IN TIME.

Positive and negative eras alternate in the history of man. The religion of Moses is a positive revelation or Theocracy—Idolatry or Polytheism is negative. The religion of Christianity is a negative revelation or critical era of interpretation, metaphysical analysis, and logical discussion. Catholicism is the positive or organic form of Christianity; Protestantism, its negative or critical form. Monarchy or despotism is the positive organic form,—popular disaffection the negative or critical form, in politics. The alternation of these constitutes the law of progress.

MENTAL PROGRESSION.

IN TRAINING MANKIND AS RATIONAL BEINGS, A SHARP CONFLICTION BETWEEN THE TWO POWERS IS INDISPENSABLE.—Every important subject, therefore, is presented under a double aspect—each aspect again reducible to a double aspect to infinity, and opposite parties or individual ideas and feelings raised up to represent it. Thus, for instance, the influence of the creative mind, in the education of man, is manifested under two contrary opposite relations, which may be called

1st. REVELATION. 2nd. SCIENCE.

Revelation is a species of enigmatic science, which belongs principally to the unlearned and the weak, and comes to them through involuntary visions and oral communications variously

Science is a species of elaborated revelation, which is cultivated chiefly by the learned and the powerful, and comes to them by analytical observations of the processes and phenomena of

experienced. The lowest order of revelation is generally called insanity, monomania, or hallucination. The highest order is dignified by the name of prophecy by its disciples, and of imposture by its opponents. It has exercised great influence over mankind. The Jewish theocracy and the Heathen oracles were both dependent upon this mysterious operation of Nature, which has no doubt been frequently affected and counterfeited by art and imposture, but has ruled the world only by virtue of its reality. It is a temporary provision of Nature in times of scientific ignorance—a maternal substitute for the rational faculty, whilst the latter is undeveloped by the experimental knowledge of the laws of Nature. Like all the direct communications of Nature to the mind, however, it is deceptive, in order that the exercise of the reasoning faculty may not be prevented or superseded. Mystery is the best or only method of effecting this deception, because mystery leaves the truth in doubt, gives material to think of, and a motive to exercise the faculty of thought. Wisely, therefore, has Nature ordained that revelation should be a riddle, declaring general truths enveloped in particular fallacies. These particular fallacies cause sectarian division, critical discussion, and mental development, whilst the general truths float about in the ocean of scepticism, waiting the appointed time for their full manifestation.

The most systematic revelation is that which has subdued all the rest. Its root is Judaism, which seems destined to spread its wings over the whole habitable globe. Judaism was a mystery. Christianity threw off its first chrysalis, and revealed an inner meaning, of which the first Jews had no idea. In Christianity is evidently concealed something still more perfect than what has yet been revealed in practical form. That better system we call UNIVERSALISM, because of its universal adaptation to the wants of mankind. This system is contained in Christianity, in the same mode in which Christianity was contained in Judaism. The Christian mystery and its forms are symbols, and symbols only, of a perfect and final system, which is the fulness of time—the end of mystery—the redemption of man, and the fulfilment of the promises made to the fathers in the various enigmas of revelation.

Hence Judaism, in its progression and transmigration along the stream of time, swallows up all minor revelations and all the powers of art and science, and establishes itself in the centre of civilization and intelligence, as the high-priest of human society; and having entered into the second sanctuary, or the holiest of all, by the representative of God, we now wait its triumphant return, to establish that truth and righteousness on earth, which have, in all ages, been the burden of the songs of bards and seers, whose un instructed eye could not perceive the plan which the Almighty mind had formed, in harmony with the laws which bind the universe.

Revelation has been rendered an instrument of tyranny by faith in ignorance of the universal law. Its organic principle is the poor man's friend, and points to the moral sovereignty of the people.

external nature. It belongs to the manhood or maturity of society, and is not fully developed until revelation has fallen into disrepute as the phenomenon of infancy, and ceased to exercise more than a passive or reactive influence over the political condition of mankind.

In its first manifestations it is at variance with revelation. It seeks final causes in matter and dead laws of matter, and explains all phenomena by chemical operations in Nature, and undirected imaginations in man. In this search for material first causes, it discovers secondary and proximate causes, which it substitutes, for the personifications of Fetichism and Polytheism. It makes bold attempts also to materialize the first cause, and represent it as an unconscious blind necessity. In this state of inquiry, universal Nature appears a chaos, Design is only visible in the works of man, and the great works and movements of Nature appear to it like fortuitous results of accidental coincidences. It is not to be supposed that, in thus groping in the cavern of sensuous observation, science can perceive a methodic plan or drama in the history of man. It has no better method, therefore, of satisfying its curiosity, than by referring the great phenomena of social life to chance, ignorance, imposture, ambition, and other subordinate agents in individual minds.

All this while it is at variance with revelation as a fact. It may receive revelation in part—such as the small fragment of Christian revelation; but it rejects revelation as an elementary science—the poor man's portion, in which God has appeared in foolishness and weakness, but from which faith expects him to come in wisdom and power.

This blindness of science renders its unity impossible. It cannot construct a theory of universal Being. Whenever it attempts to do so, it leaves out the poor man's portion, and sneeringly ascribes its phenomena to mental weakness and scientific ignorance. The poor man has his revenge. Science is divided, and cannot find the principle of unity without submitting to what it deems a degradation. Thus, the two principles at present confront each other, and each being possessed of a large portion of vital truth, they must continue to confront and militate, until a universal principle of conciliation be discovered, by which the apparently contrarious truths may be united.

This principle of unity we present in Universalism, which is only the completion of Judaism and Christianity, being opposed to neither, but the parent and offspring of both,—prefigured in the law, and transfigured in the gospel—in types and shadows, and imperfect forms, which cannot make their worshippers or followers perfect, remove the evils of life, or the burden of the conscience.

Science has been profaned and materialized by infidelity, which, in ignorance of the universal law, has denied revelation to be a department of natural science.

THE PROGRESS OF HUMAN SOCIETY IN RELIGION, SCIENCE, AND POLITICS.

RELIGION.

ORGANIC.

(The Organic principle is unity, or conscious purpose.)

The Religious progress of man above described, divides itself into three organic stages.—First, two active or hostile stages, the Law and the Gospel, being symbolical representations of the bipolar powers, or agencies of Nature.—Second, one passive or central stage, being the point of rest in which those two activities concentrate. The first two are theologically denominated the old world, or the world of SATAN, which means ANTAGONISM, or the Spirit of Antagonism.—The Third is denominated the New World, or the Millennium, being the rest appointed for man on this earth. Jesus Christ, the representative of God, came at the point of union of the two former, thus representing God in his conflictive and enigmatical

INORGANIC.

(The Inorganic principle is partition, or unconsciousness.)

The inorganic forms of Religion are Fetichism, Polytheism, Idolatry, and all those religions which have not a progressive principle, by which they become transformed into a higher condition of being, still preserving their identity. These include all religions but Judaism and Christianity, which, like man and woman over the animal creation, have power committed unto them to subdue all other forms, themselves also being destined to a new transformation by the universal law. Mahometanism is a close approximation to an organic principle, for it acknowledges the divinity of prior institutions, and claims a descent from antecedent missions. But Mahometanism has rewritten and corrupted the records of its predecessors, and does not take the

character. In this capacity he came "not to send peace, but a sword." This not being the true point of union, inasmuch as Christianity, the second active principle, had yet to be revealed, the first coming of Christ is *not* the true coming; that is, the redemption brought is not the true, but a symbolical, redemption, like that under the law. The second coming is the true coming, and the true point of union; for the two activities of Law and Gospel have been fully revealed, and are now represented by two visible churches, one of these having been singularly preserved for eighteen hundred years, to represent the principle of the law in which the organic movement originated. The Mahometan Church may be regarded as a national substitute for the Jewish; whilst the house of Israel in its scattered condition, symbolizes the broken body of the universal law, distributed in fragments over human society, to be finally gathered into one all-uniting principle.

The Law is organic in relation to the Gospel. It is a political system, and therefore universal sovereignty was figuratively promised to the Jews. Catholicism is the organic form of Christianity—its power is spiritual. The third organic dispensation is a union of the universal Law, of which that of Moses was only symbolical, and the universal Gospel, of which Catholicism is symbolical. Being only symbolical, the two first churches possess neither the true form nor the true spirit of the third. The third is the Eternal Law of Nature, adapted to human society, and reconciled with all antecedent revelations and divine institutions. This alone is the perfect organic system, to which preceding systems are only preparatory.

The organic number is three.

ORGANIC.

The organic principle in science is unity—conscious power and purpose—in the universal agent. Science is never satisfactory, until it discover the primary or universal cause. The first organic form of science is theology, by which all terrestrial phenomena are vaguely ascribed to individual spiritual agents under one supreme. The second organic form of science is natural philosophy, in which secondary causes are the objects of investigation. These secondary causes being first personified as gods and goddesses by polytheism, are afterwards materialized by philosophy. In this form theology gives the divine unity a potential or mediate supremacy; but asserts the independence of parts, by the ascription of power to created beings, in opposition to the Divine will. In the third and last form, organic science becomes perfect by the ascription of all causation to the Divine will, as the *primum mobile*. The third form differs from the first in this, that the first had no knowledge of the subordinate or secondary causes and mechanical laws. The third knows the secondary causes and laws, and perceives and acknowledges their relationship to the universal primary cause.

Theology is, therefore, the universal science, the sea from which the sciences proceed, and into which they finally return.

The organic progress has three stages.

ORGANIC.

The organic principle being unity, is reducible to three different forms. First, Monarchy, in which one governs independent of the consent of the governed. This, in rude nature, is the result of physical power. Second, Aristocracy, in which a few govern by association, at the head of which association one is placed; thus uniting monarchy and aristocracy in one. Third, Universalism, or Democracy, in which all govern by association, at the head of which one is placed, with subordinate coadjutors. In these three forms the organic principle is unity, either single or compound; the single, *i. e.*, monarchy, being most conformable to a state of inexperience, is the first form; the universal association is the last, and most perfect form—but the organic principle of unity is the same in all.

The tendency of all popular progress in politics is to attain

lead in the progress of civilization. There can be only one leader. That leader is bisexual, being a compound church. The inorganic forms of religion encircle the organic, and constitute Heathenism. Heathenism is the cradle of art and science, or material philosophy. It wants unity, but it is possessed of infinite variety. The Egyptians and the Grecians were the parents of the arts and sciences. The organic Church of Jewish Christianity has, however, absorbed the whole Ethnic philosophy and religion. Catholicism has re-cast the gods and goddesses of antiquity, and baptized them anew by the names of Christian saints. The inorganic forms are not destroyed, but combined with the organic, in customs, rites, holidays, and superstitions. But the inorganic are lost or forgotten in the organic; for the organic is the channel of civilization and progress, and preserves its identity for ever, subject only to three generic modes of manifestation.

The Gospel is inorganic in reference to the Law. The Law had only one temple, and its religious and political constitution was one. The Gospel is an era of criticism and division. Even the unity of the Catholic faith is interrupted by the variety of political conditions to which it is subject. But the Christian Church contains one portion of the universal law, which the Jewish law has not, *viz.*, spiritual succession, in opposition to hereditary succession. Its authorities are all elective in principle, but the mode of appointment is corrupt.

All religion is inorganic until it arrive at universalism. But the Jewish and Christian dispensations are the *growing germ* of Universalism, or Universal Organic Catholicism.

The inorganic progress has three stages—Polytheism, Sectarian Monotheism, and Atheism, ending in Universalism. Its number is four.

IN SCIENCE.

INORGANIC.

The inorganic principle in science is partition, or divided agency, unconscious power, and want of purpose, in primary causation. Inorganic science is atheistic, and seeks first causes in elementary matter. It assumes various forms. First, Fetichism, in which a spiritual power is supposed to reside in each particular substance, as nymphs in streams, fawns in groves. Second, Religious Materialism, in which natural agents are supposed to act by a self activity, independent of, or in opposition to, the will of the organic principle. Third, Atheistic Materialism, in which blind necessity is regarded as the organic power, without will or conscious purpose. These are all modes of one inorganic system, for if an organic will be not necessary for the parts, the whole does not require it, and *vice versa*.

Inorganic theology, therefore, or sectarianism, centres in Atheism, which is the *concealed* principle of old society. Atheism is a negative Universalism, and is the transition state through which theology passes from sectarianism, or the faith of a partitive Deity, to Universalism. It is universal only in the physical sense, denying intelligence and moral purpose to the universal cause.

The inorganic progress has three stages, and then loses itself in the organic. Its number is therefore four.

IN POLITICS.

INORGANIC.

The inorganic principle being partition, every political system is inorganic until a universal association take place. Monarchy is but a feigned or symbolical species of organism. Aristocracy is equally imperfect. Democracy, in the highest sense of the word, includes both Monarchy and Aristocracy. In this sense it is a perfect form of government. But in so far as Democracy has been hitherto reduced to practice, it is more inorganic than either of the other two forms. Having the largest amount of ruling power, it is most difficult to organize. When imperfectly organized, it is most destructive; when completely organized, it is the very perfection of political justice.

Private appropriation of land is an inorganic principle. Though necessary at first, to give birth to agriculture, it becomes the source of political inequality and social discontentment. So-

to the latter form. The obstacles arise from the division of mind which prevails in respect to religion and private interest; but the organic principle remains always the same, and resides, either passively or actively, nominally or really, in an individual. The organic and inorganic principles alternate and co-exist. The latter is the opposition which either destroys the former, or compels it to reform itself. The organic always rules, but the opposition becomes the organic when it attains to power. The two therefore alternate, and each is imperfect and corrupt, until universalism be established, which is Monarchy, Aristocracy, and Democracy, in perfect unity.

Tria juncta in Uno.

Organic politics are threefold.

N. B. All is organic in relation to God and his plan. It is only in relation to man's partitive conceptions of religion, science, or politics, that we can with propriety use the epithets inorganic or imperfect. God is the universal organic principle, and Nature is the universal organism. This fact is the foundation of social wisdom, the universal law.

THE UNIVERSAL LAW.

The law is the scientific and political department. Its agents are the head and hands of man acting organically for the construction of good, and inorganically for the destruction of evil, and its principles are justice and truth. It is the exterior gospel. Its representative is "man."

THE TWO TABLES.

The universal law is bipolar, or twofold. All Nature arranges itself in pairs, whether in chemical agency, vegetable organization, or animal construction. Positive and negative powers are the source of all action, of all life, of all thought and feeling.

MAN AND WOMAN.

Man and woman are one, in the same sense that the positive and negative exhibitions of the universal agent of nature are one—distinct but inseparable, one yet two. As a generator the male is the organic principle, which collects and organizes the material of the female—as Jewism collects and organizes the material of Gentilism. The characters, offices, and duties of the two sexes are eternally distinct, and never can be confounded. But they are equal. Woman in moral action and re-action is equal to man in physical and intellectual action and re-action. The denial of this equality is the feature of the old world, and constitutes the oppression of woman.

PROPERTY.

The world belongs to man—soil to the nation—land to the people. An individual's talents belong to himself. Rent of land belongs to the people—wages of industry and skill belong to the individual—Rent of land, therefore, is public revenue—wages are private revenue. Private wages ought not to be taxed for public purposes, nor public revenue applied to private purposes. Private property in land is a fiction in universal law, and is not necessary for the preservation or perfection of agricultural science, though necessary to give it birth.

GRADATION.

Gradation is a universal law which cannot be repealed, but may be modified. It should be determined by moral, intellectual, and physical worth, not by hereditary privilege, which is a fiction in universal law, of a temporary nature, subserving a useful purpose in times of confusion and ignorance, but incompatible with a system of social justice.

Cities hold the same relationship to villages as ministers to a department, and the metropolis to the whole as the supreme head to the people. Cities give mental vigour to society. They are heads of the body politic, but they should be built systematically, and their inhabitants grouped according to professional rank and employment.

MARRIAGE AND DIVORCE.

The universal law of marriage and divorce is love and hatred. Love is a marriage, hatred a divorce, of the affections. The

ciety is imperfectly organized as long as it exists. Property is twofold—public and private. Public is *Nature*, the soil, the gift of God to the species; private is *art*, the produce of genius and industry, the gift of God to the individual. Each has a growing or diminishing value. When public property is appropriated by individuals, and when private property is appropriated by governments, society is in a disorganized state. This disorganization can be removed by Universalism alone, which acknowledges the original equality of individuals, the public property of soil, and the private property of industry, genius, and moral worth.

Inorganic politics are threefold, ending in organic universalism. Their number is four.

universal law must be checked by artificial unions so long as mankind are incapable of preserving social order and domestic peace without them. But the nearest approximation to the universal law must prevail in the most perfect condition of public propriety and domestic happiness.

GOVERNMENT.

The principles of government are two—*law and liberty*. The first teaches us that a good or bad personal, social, and political condition produces corresponding goodness or badness in men. The second, that each mind is originally cast in a mould adapted for creating good or bad personal, social, and political conditions. Upon the first principle arrangements should be made for the formation or discovery of character. Upon the second, men should be distributed according to their capacity for the formation and direction of circumstantial arrangements. The principle upon which the peace of society chiefly depends is *UNIVERSALITY* in religion, science, and political interest. Community is the *beau-ideal*.

Men and women are free servants of the State.

Children are wards of the state, and of their parents.

CONSTITUENCY.

1st. MORAL AND IMAGINATIVE

LAWYERS AND PRIESTS, to teach the moral and spirit of wisdom by universal views tending to refine the affections, regulate the conduct, and elevate the imagination to the most sublime conceptions of the works of God and the destiny of man.

III.

ARTISTS, to reduce to sensation by sculpture, painting, poetry, architecture, and song, the conceptions of the universal department of thought and feeling, giving full scope to the power of imagination.

2nd. SCIENTIFIC AND MECHANICAL

CULTIVATORS OF SCIENCE AND LEARNING, to promote and teach departments of knowledge, such as chemistry, astronomy—history, languages, &c., subduing the imagination.

IV.

ARTIZANS AND NEGOCIATORS, to produce the necessities and comforts of life, with the imagination in subjection.

(N. B. The highest order of artisan is an artist or scientific.)

These are the seven departments of social activity, and their highest grade of associated influence constitutes universal government, which equally cherishes them all. They include both sexes. The parental and filial relationships being organic and inorganic powers of limited influence, can only be regarded as governments in miniature, subject to the universal law of social arrangement. The teacher is merely an organ for communicating to the young what is known to the old. He belongs to one or more of the seven, according to the prevailing character of his mind; literary most frequently.

VII.

THE EVERLASTING GOSPEL.

The gospel is the spiritual and moral department, and its principle is peace. Its agents are the head and heart of man, acting organically in love, and inorganically in hatred. It is the interior law. Its representative is "woman."

THE CROSS.

The cross is the scientific emblem of the primary power of Nature. Electro-magnetism, which is now generally supposed to be the universal physical agent, is a pure cross. The two streams of electricity and magnetism always act at right angles, thus \perp . The cross is, therefore, the symbol of divine power—the arms of the Almighty. It is found amongst all religions; but it is the distinctive banner of Christianity, and belongs, by universal consent, to the man who is distinguished as the representative of Deity on this planet. It appears first as a local and insignificant accident, and at last as a universal truth. Love and hatred, or affirmation and negation, constitute a cross, and the source of will or activity in conscious being. The former is organic, the latter inorganic. They are inseparable.

SACRIFICE.

A religious rite, of growing import, like the cross. *The sacrifice of evil* is the everlasting worship of God. Its first symbolical manifestation is the killing of beasts, *clean beasts*; implying, that although evil is a beast, it is a necessary and pure instrument of Divine Providence in the government of Nature. Evil is created to be destroyed, i. e., to give man and all other creatures employment. The second symbolical manifestation of sacrifice in Christianity is the killing of the human nature of Christ. This sacrifice is daily performed figuratively in the Catholic Mass, and in the Protestant Eucharist. It implies that the mere human authority is an insufficient saviour, and must be destroyed. Man can never find the saving principle till he come to the UNIVERSAL LAW, which is DIVINE NATURE. Sacrifice continues symbolically till this universal law be found. Symbolical sacrifice then ceases, and men worship God in genuine truth by *sacrificing evil*, which is the appointed victim, always dying, but never dead.

PRAYER.

A religious rite of progressive meaning, appearing first as an imprecation or charm, then as supplication, orally expressed, with a humble attitude of body, in expectation of divine inter-

position, independent of personal exertion. In its symbolical stages it is ceremoniously performed in temples, in association with symbolical sacrifice. But when it reaches its ultimate perfection, it becomes merely a firm reliance on the wisdom of God in the government of the world, accompanied by an unceasing activity in the sacrifice of evil. True prayer is the desire and confidence of the heart for the destruction of evil. True sacrifice is its handmaid, to perform externally what the former desires and expects.

ETERNAL REWARDS AND PUNISHMENTS.

Religious doctrines of progressive meaning ending in the UNIVERSAL LAW. They first appear as favouritism and vengeance in a party god. Two places are provided for the opposite extremes, and the good and the evil, the pleasure and the pain, are separated for ever. This idea prevails until men perceive the universal law, which is simply this—that good be rewarded and evil punished for ever; but, more especially, in the final stage of social progress in this life, or of being in a better, when the universal law will be established as the law of life and social intercourse. Rewards and punishments are, therefore, eternal, both in this life and that which is to come. But this truth is a pleasing truth, and not an object of alarm, inasmuch as happiness itself consists in the unceasing punishment and destruction of evil.

ORIGINAL SIN.

A religious doctrine, implying that man is so constituted by God as necessarily to fall first into a condition of social confusion. He falls into this confusion by searching after knowledge, and continues in it until that knowledge concentrates in the UNIVERSAL LAW. He then produces social order, and is socially and individually redeemed from the ascendancy of evil, and the fear of death. The Redeemer is the universal law of God, i. e., DIVINE NATURE, or the Messiah, and reveals himself in a harmonious solution of the mysteries of religion, and a harmonious organization of society upon the principles of social unity and political justice. Original sin is native imperfection, and is the source of all human activity. The Redeemer is the Divine law in man, which will eternally lessen that imperfection so soon as the universal law begins to reign.

RESURRECTION OF THE BODY.

A religious doctrine, taught first as a gathering of dry bones and mortified dust for the rehabilitation of disembodied spirits; but in its ultimate meaning teaching first the prolongation of corporeal, conscious, and progressive being, after terrestrial death; second, the sanctification of the body in a state of terrestrial reformation. In our present condition the body and its passions are the chief sources of all social evil; self-denial is, therefore, a virtue, for the passions are the enemies of man. Under the government of the universal law the passions cease to be sources of evil. The body thus becomes sanctified, and raised from the grave of humiliation and shame in which its passions have hitherto inhumed it.

JESUS CHRIST CONDEMNED AS A LUNATIC BY THE LAW OF ENGLAND.

A LONG and most interesting trial has been conducted, for fifteen days, before a Commission of Lunacy, which has ended in pronouncing a verdict of insanity against Mr. George Davenport, for being a Christian. Mr. Davenport was a man of large property, £60,000, which he did not value except as a means of doing good. He spent it as his religion taught him to spend it, viz., in donations to religious societies, and to the poor. He settled also a permanent income on his wife, and took measures to transfer to her the interest of money in the funds, merely to relieve himself of all pecuniary or worldly concerns. Being examined by the learned gentlemen, he gave most triumphant answers. In reply to Mr. Phillimore's insinuation of folly, in

giving his property to his wife, he read the marriage ceremony of the Church, "With this ring I thee wed, with my body I thee worship, and *endow thee with my worldly goods.*" Now mark the reply of Mr. Phillimore:—"Yes, though that is the language of the marriage ceremony, it is not the language of the law." Think of that, and the boasted fact of the Church established by law. Jesus Christ told his disciples to give away their earthly treasures, that they might have treasures in heaven. The law of England says *Christ is a lunatic*. The Jews condemned Christ as a malefactor. The Gentiles have made a madman of him. The Jews acted consistently, for they rejected the malefactor whom they crucified. The Gentiles have acted the part of madmen, by giving a verdict of lunacy against the man whose name they have assumed, and whose church they have politically endowed.

Perhaps there is not a better Christian in England than Mr. Davenport. He despised the vanities of life, and therefore gave his coach and horses to his coachman; he despised the gaudy tinsel of gilt plate, and refused to make use of it at his table; he loved and pitied the poor, he longed to improve the condition of the people, and spread the doctrine of his Master; he loved his soul more than his life, and truth better than money. For all this he was regarded as a lunatic, and his property taken from him, although he had previously secured his wife's independence. Children he has none.

How many gamblers, rakes, and vagabonds, spend their money in a more foolish and *less Christian* style, and preserve their legal sanity to the end of their lives, as well as of their fortunes! To be a reckless gamester is no proof of unsoundness of mind, but to be a *Christian* makes a man liable to a charge of lunacy. Oh apostacy! Oh England! England! Change thy name, for heaven's sake, and call thyself no longer Christian!

It may be said, in justification of the verdict, that Mr. Davenport considered he had the power of exorcising. This power is exercised by the Church, and his counsel read the seventy-second canon, which gives the bishop power to license a man to cast out devils. *Here is the law! there is the verdict!*

The behaviour of Mr. Davenport, during a keen examination of several hours, was remarkably calm, and his answers were quick and pointed, and remarkably in accordance with the letter and spirit of the New Testament.

We consider this verdict as a verdict of lunacy against Jesus Christ.

EDUCATION.—SYNOPSIS OF FELLEBERG'S SYSTEM.

PER FRANCIS WILBY.

Train up a child in the way he should go, and when he is old he will not depart from it.—*Solomon.*

THE highly-important subject of education, which hitherto has been treated with the greatest neglect, it is hoped is at length appreciated, and will ere long become a question for the deep consideration of all who are desirous of dispelling the Cimmerian clouds of ignorance, which now overshadow the minds of the multitudinous classes of society.

It is an undeniable fact, reflecting the greatest discredit, that hundreds, who are denominated teachers, are utterly incapacitated to effect the advancement of their pupils in the paths of erudition, but from the preponderating concomitance of error in their scholastic arrangements, more frequently debilitate and mystify the minds which, under careful treatment, would have become enlightened and powerful. It is the duty, then, of society to insure a good education for every individual, in order that all may be rendered useful members; but as long as the contaminating state of the existing modes of education adopted in the schools continues, the injurious results will be developed in each successive generation. Education should at all times be rendered pleasing; but on the contrary, it is too frequently made a task of, thus creating a dislike for learning, which it is the duty of the teacher to make amusing: in fact, instruction should ever be combined with amusement. The System, a synopsis of which I now lay before your readers, is calculated to render education both amusing and effective, and would, if universally adopted, be productive of the greatest national benefit.

LABOUR.—As bodily labour forms the principal occupation of mankind throughout life, from childhood should they be habituated to it. Accordingly, to give them a habit of perseverance and skill, bodily labour is one, indeed the grand mean, of education.

HOW TAUGHT EARLY TO APPRECIATE THE VALUE OF LABOUR.—But giving the habit of labour is not sufficient. A man who labours for another, without himself having an interest in doing so, is a slave. It is therefore necessary that they should have some opportunity of directly and palpably perceiving the profit of what they do; and consequently, each lad has a little

garden to himself, which he cultivates for his own advantage, and disposes of the produce.

HOWEVER VALUABLE MAY BE THE HABIT OF PATIENT INDUSTRY, AND A DUE APPRECIATION OF ITS WORTH, KNOWLEDGE, MORALITY, AND RELIGION, ARE NECESSARY TO HEIGHTEN THAT VALUE.—But as the man who labours without knowledge will expend much time to little purpose; and the man who labours without having had the moral and religious sentiments cultivated, would do so merely for the sake of animal gratification or self-preservation; to improve the means, there must be knowledge; to ennoble the end, there must be morality and religion. This system, consequently, does not stop short, but having obtained the safeguard, the ballast of the vessel, viz., the habit of labour and the perception of its value, proceeds to the cultivation of the intellect and moral sentiments, to give a capability of healthy action to every faculty of the human mind.

1. To give such a knowledge of surrounding objects as will enable the individual to form an accurate estimate of the relation of his own powers to them.

2. To increase the power of the individual, and consequently extend his dominion over Nature; and

3. To cultivate whatever faculties have a tendency to exalt the religious and moral sentiments, appear to be the principal objects of intellectual education.

THE VALUE OF THE HABIT OF ACCURATE OBSERVATIONS OF THE DIFFERENT OBJECTS SUBMITTED TO THE SENSES.—It is the habit of accurately observing the actual nature of objects, as perceivable by the senses, and distinctly marking their differences, which in after life renders a man intelligent and judicious; but, in modern education, a child's observation at the moment when all is new, and observation most active, is willfully drawn away from things to the signs of things; and the boy who might have been made so easily to distinguish different objects around him, has only learned to distinguish one letter from another.

HOW TO ATTAIN THIS HABIT OF ACCURATE OBSERVATION.—To give this habit of accurate observation—this habit of pausing to survey different objects, is one of the points most particularly aimed at in the cultivation of the intellect by the founder of this system. In order to give an idea of this method, we will give the substance of a few notes taken in the school-room, while the children were receiving their morning lessons. A boy brings a flower.

Master—What is this? *Boy*—A plant.

M—Is it a complete—a whole plant? *B*—No: it has not any roots.

M—What is this?—(showing him the stalk.) *B*—The stalk.

M—What is its colour? *B*—Green.

M—What is its form? *B*—Round.

M—What are these?—(showing the angles around it.) *B*—Edges.

M—What is at the top of the stalk? *B*—A flower.

M—What is its colour? *B*—Yellow.

M—And on the sides? *B*—Leaves.

M—What the form of the leaves? *B*—The form of a tongue.

M—Are they rough or smooth? *B*—Rough.

M—Have they stems? *B*—No.

M—Repeat the account you have given. *B*—It is a part of a plant; the roots being wanting, with a stalk that is green, round, and with edges; it has a yellow flower, and its leaves are of the form of a tongue, rough and without stems.

M—What are these? *B*—Buds.

M—What are buds? *B*—The flower before it comes to maturity.

The master then proceeds with the leaves of the flower, the petals, the height of the plant, the soils it grows in, the time of the year it appears; its properties, medicinal, poisonous, nutritious, &c. In the same manner will different objects be proceeded with, stones, trees, animals, &c. All affirmatives, with regard to an object, are noted, and a repetition of the sum of them always required. Thus, the observation, discrimination, and memory, are exercised at the same time. For distance, the

master makes a point in the centre of a table, explains what the meaning of a centre is—he then makes two points at a distance from each other, as A., B.; the boy is required to make a point on the other side of B., equal to C. B.

A. C. B. D.

After each trial of his senses, he is required to test what he has done by measurement; he is next required to mark a space twice, and thrice, the length of A. D. The child being practised in height as well as in length. From points, the child proceeds to lines, measuring angles, &c., in a gradual and pleasing progression, which cannot fail to cultivate the habit of observation. In addition to the means made use of to convey and retain the ideas,

DRAWING is introduced, for however rude the representations of persons, places, or things may be, they bring back what is past to the memory, with a singular vigour and fidelity.

NUMBERS.—The elements of number, or preparatory exercises of calculation, should always be taught, by submitting to the eye of the child certain objects representing the units. A child can conceive the idea of two balls, two roses, two books, but it cannot conceive the idea of two in the abstract. The child will more easily understand that two and two make four, if you show it to him first in reality. Experience has shown that children well versed in these illustrative elementary exercises, afterwards displayed great skill in head-calculation, (*calcul de tête*), without repairing to their slate or paper; without making any memorandum of figures, they not only performed operations with large numbers, but they arranged and solved questions which at first might have appeared involved, even had the assistance of memoranda, or an execution on paper been allowed. This proves that the infant mind should be acted upon by illustrations taken from reality, not from rules taken from abstraction; that we ought to teach by things, not by words.

GRAMMAR.—In grammar the master gives the boys two or three substantives, with a verb predicating the same thing; for instance, "the father is good, the mother is good, the master is good;" and afterwards shows them how to collect it into one sentence,—as, "the father, the mother, and the master are good." In order to discover that what is explained is understood, their knowledge is tested at every step; it is never taken for granted that they understand a thing because it is easy, until, by something proceeding from themselves, they discover the fact to be so. The smaller boys seek them in the objects they are daily conversant with; the elder in the facts of science or history—as, snow, chalk, and paper are white; and France, Spain, and Austria, are kingdoms.

THE VALUE OF MORAL CONDUCT.—But, if it be important to cultivate the intellectual faculties, it is still more so to develop the moral. The one is but the instrument which performs the work, while the other fixes upon and ennobles the object, which otherwise would only be indicated by the animal wants or passions. The first thing is to treat a child as a reasonable being, to make him understand that a thing is right or wrong, without any reference to the will or the caprice of others; that he must judge of the nature of things by the aid of reason, influenced by conscience, and that as a man he should do boldly what he is confident is right. Prizes and degrading punishments are never introduced. Where a child has committed a fault he is called upon for his reason for doing it, and it has been found that the confusion produced by the incapability of giving a satisfactory one, has more power in repressing what is wrong than ordinary punishments.

OF THE VALUE OF ORDER AS A HABIT.—However brilliant may be a man's talents, or benevolent may be his intentions, talent will degenerate into unconnected and useless sallies, and benevolence will for ever be defeating its own purposes without it. In this system it is insisted upon in the conduct of every child, and becomes wound up with their being. It is required of them, and they see it everywhere around them. The absence of order must afford pain to children thus brought up, and its value must continue to be appreciated throughout life.

MUSIC.—In an institution where nothing is neglected that can in any degree assist in either fostering the nobler sentiments or feelings, or in developing the physical portion of our

constitution, music must necessarily form a part of education; for, while the voice is obtaining flexibility and power, and the ear correctness, the songs themselves are made the vehicles whereby the noblest sentiments are communicated in the most touching manner.

RELIGION.—If no direct utility could be pointed out in religion, the circumstance of its invariably co-existing with the highest order of moral attainment, would be a sufficient reason for its political cultivation. There is not, consequently, any one point more attended to than the imbuing the minds of youth with profound sentiments on this important subject. They are neither wearied with long religious offices, nor checked in any of their innocent amusements; but every study is made to tell indirectly upon this point, and no circumstance is allowed to escape from which the lesson can be drawn. The gospel was to bring peace on earth, and good-will towards man, and in this spirit it is taught.

The space allotted for this article will not admit of farther explanation; but, should any of our readers desire to possess a further knowledge of this system, we refer them to the Pestalozzian Academy, 25, Curtain-road, conducted by Francis Wilby, where this system is taught, and will be explained with pleasure to any who may desire it. Yours, devotedly,

FRANCIS WILBY.

Pestalozzian Academy, 25, Curtain-road.

CORRESPONDENTS.

I. S.—Next week we shall make some general observations on *Social systems*, in which those alluded to by our Correspondent will not be forgotten. But a mere agrarian system is not a universal or social system; and never can embrace those comprehensive views of the universal law which are indispensable for the satisfaction of the most refined and sensitive portion of society. They are very useful as political outlines of external arrangement. But more than this is requisite. The Radicals perhaps may not think so, or regret that it should be so. But still it is so; and it is so, not by a temporary or artificial law of custom or policy, but by an unchangeable law of human nature. Paine's political sentiments were the offspring of the universal law in politics, but he could not embrace the other departments of being, and enclose them all within his "novum organum." Spence's system was equally exclusive; a mere labourer's farm yard, organized, however, upon the principles of agrarian justice. Socialism, in the highest sense of the word, aims at something beyond this, because this is not sufficient. There must be satisfaction given to the mind upon less material subjects than grass and clover, and the distribution of crops. When the people arise above these fundamental questions, they will find more and better friends than they now have. There are many pure, disinterested philanthropists in the world, who would willingly give them all that they have, if once they were satisfied that the use that would be made of it would exalt the dignity and purify the mind of the human being. To give this satisfaction, the people must present a foretaste of it in their principles. They will then be worthy to possess, and they will possess. What is it that gives man superiority over the brutes? greater intellectual and moral utility for purpose. All power lies in this secret. Let the people show this, and the power is theirs immediately. And how can they show it? Only by rallying round a simple, and intelligible, and universal standard. Till then they are slaves, and revolutions are only civil wars and satanic combinations.

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*
"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 39, Vol. III.]

SATURDAY, MARCH 24, 1838.

[PRICE 1½d.]

SKETCH OF THE HISTORY OF SOCIALISM.

Or the numerous individuals who have meditated the political and social improvement of society by new external arrangements, which they have digested into a system, we may specify Campanella, Lord Bacon, Harrington, Condorcet, and Godwin. It is useless to give any formal outline of the modes by which these individuals propose to improve the external, intellectual, and moral condition of their species. Some of them, probably, had no positive faith in the practicability of their schemes, but invented them as modern writers do a romance, or as Dean Swift invented the kingdom of Laputa, for the amusement of literary ease, or the ambition of literary fame. They are mostly all borrowed from their great originals, Moses, Lycurgus, Plato, and his disciple, Aristotle, whose works on politics suggest a model of social government very much resembling those which are at present advocated by the most enthusiastic friends of social equality. Indeed, it is difficult to imagine more than one social system. There can be only two systems, a social and an unsocial; a system of equal rights, and a system of unequal rights. The modifications of these two may be varied to infinity; but all systems must belong to one or other of these two categories. Society has always been based upon the unequal system; hence it is reasonable to suppose that all social reformers should agree in adopting the standard of equality, either absolute or proximate.

The law of Moses was a close approximation to a system of equality; but it was never fully established. Its principle was public property divided into inalienable inheritances by lot; and private alienable property in moveables and houses within towns. Farm houses were inalienable as belonging to the land. The land belonged to God, and no man had a right to sell it. He might dispose of his own portion for forty-nine years, but at every jubilee the inheritances all returned to the original owners. For this reason, Israel is called, by way of eminence,—"a people of inheritance." The septennial discharge of debts also was exceedingly beautiful, infinitely more generous than anything which prevails in modern times, when a man may lie in prison for thirty years to satisfy the demands of a creditor. By the law of Moses the debt is canceled on the Sabbath year, although contracted only the year preceding; and the following noble injunction, so unlike the practice of both Jews and Christians, given respecting it:—"If there be a poor man among you, one of thy brethren within any of thy gates, in the land which the Lord thy God giveth thee, thou shalt not harden thine heart, nor shut thy hand from thy poor brother. But thou shalt open thy hand wide unto him, and shalt surely lend him sufficient for his need in that which he wanteth. Beware that there be not a thought in thy wicked heart, saying,—*the seventh year, the year of release, is at hand;* and thine eye be evil against thy poor brother, and thou givest him nought, and he cry unto the Lord against thee, and it be sin unto thee. Thou shalt surely give him, and thine heart shall not be grieved when thou givest unto him, because that for this thing the Lord thy God shall bless thee in all thy works, and in all that thou puttest thy hand unto." And, verily, we do believe that there is not a better method of securing a blessing than obedience to this very precept. The

Jews, however, like all religious apostates, refused to keep the law. Their lawgiver foretold their apostacy, and divided his curse and blessing amongst them; and now, like the Christians, they preserve the name, but have lost the spirit of their meek and disinterested apostle.

About six hundred years after Moses, flourished Lycurgus the Spartan lawgiver, who, finding the great mass of the people miserably poor, divided the whole land amongst them in equal portions, by what the modern Whigs and Tories would call a system of plunder. In order to increase and fix this equality, he abolished the use of money, and instituted a system of public meals. This was the most powerful little association of human beings that history has preserved in the memory of man. But Lycurgus, like Moses, was merely an Agrarian. He discarded imagination, and even mechanical arts. This was a low and unprogressive condition, calculated only to develop a few of the faculties at the expense of the rest, thus deforming the rational creature of God by a Chinese shoe to hinder the growth of the intellectual organs. The Spartan system was the nearest approximation to socialism that was ever nationally established, except that of the Jesuits in Paraguay. Yet the Spartans had slaves to do all the labour, and also to commit immoral actions, that they might render vice abhorrent to the free, forgetting that in so doing the free were more vicious than the slaves. Godwin gives a beautiful symbolical illustration of this Spartan system in his "Political Justice," by comparing the Helots or Spartan slaves to the laws of Nature, which will ultimately become the Helots of men, and do all the mechanical labour, so that all men shall become free like Spartan citizens. Thus, in the progress of society, mankind shall end where those great legislators began. This is in perfect accordance with our analogical philosophy. We see the progress of society in a symbolical light, and the very first buds it shoots forth, with all their imperfections, contain the hidden germ of some fairer production to be finally revealed. The first system of slavery is necessary and temporary evil. The last is eternal good.

Those ancient prophets (for Lycurgus himself received his law by revelation from the oracle) are, therefore, not so very despicable politicians as some moderns would make them. They were, no doubt, obliged to conform to many of the prevailing habits of the age, and probably were blind to many social evils which we perceive; but, probably, we are equally blind to our modern vices, and if time could be inverted, and those ancient men could read the history of our slave-trade, and cotton factories, and agricultural labourers, they would turn up their eyes with astonishment at the barbarity of the times in which we live. Certain it is that they were greater men than modern princes, for they abandoned all personal claims, reserved nothing for themselves or their children, and divided and regulated, not according to the dictates of party-spirit, but according to the *beau-ideal* that was given them of a system for the age.

The other states of Greece had popular governments, but not communities. Athens had popular assemblies, but its senators were appointed by lot, and not by election. Rome and Carthage had also popular assemblies of the people, who passed resolutions, and suffered the magistracy to execute them.

Venice was governed in a similar manner, and these were the greatest states of antiquity. The popular power was always imperfect, and the invasion of the powerful on the rights of the people was frequent and unmerciful. A continual struggle existed between few and the many, and this struggle ultimately occasioned the downfall of the state, by the usurpation of some military dictator. But the cause of this downfall was evidently the disunion of the people themselves, chiefly arising from the want of means for creating a unique public opinion, and keeping up an intimate correspondence between the parts. The press had no existence, and rumour is a very imperfect substitute for the precision of a printed statement of facts and opinions. The organic idea of socialism was in society from the beginning, but experience and unity were wanting.

With such opportunities as ours the ancient heathens might have done wonders. They were Universalists in religion. They did not quarrel about their gods and their temples. One man did not go to the temple of Apollo, another to that of Jupiter, another to those of Esculapius, Hercules, and Diana, but each man went to all the temples, and worshiped all the gods. Their religion was a species of politeness to the various inhabitants of the heavens, and not of the heavens only, for they worshiped the king of the bottomless pit himself, with as much fervour as Jupiter and Neptune his brethren. Jewism and Christianity have gone to the very opposite ultraism, but the latter only has built sectarian temples. We are, therefore, in a very different relative position from the ancients. The liberality of the ancients consisted in receiving all the deities of the world; that of the Christians and Jews consists of rejecting all but one; that of the infidels consists of excluding all. The ancients, therefore, had a great advantage over the moderns. What was practicable with them is perfectly impracticable with us, until some universal feeling, either religious, or irreligious, be generated in the public mind. This is a most critical position to be placed in. But in this position at present we are.

The politics of Aristotle are similar in principle to those of modern socialists, although the author was the tutor and intimate friend of a powerful monarch. "Immediate wealth," says Aristotle, "that is, where one or more have greater possessions than are consistent with the equality of the commonwealth, is the cause of sedition, which ends for the most part in monarchy. For this reason ostracism (or banishment by ballot) is practised in several places, as in Athens and Argos. But it were better to prevent the growth of possessions in the beginning, than employ such means to remove the evil." Even Machiavel, that name of infamy, and preceptor of a prince, declares, that he who attempts to make a commonwealth where there are many gentlemen, must first begin by destroying them; that is, destroying their rights as private possessors. But the race of gentlemen subserve a very important end in the progress of civilization, which vulgar republicanism has not yet been able to supply. The culture of imagination and the fine arts is their especial care. The mass of the people are chiefly mechanical and commercial, and the present taste of Radicalism has an evident tendency to destroy the living germ of poetry throughout the whole sphere of imagination. This baseness has degraded America. It has no imaginative element in its constitution. It is constitutionally mean, and must be mean, until it invent some national machinery for raising the dignity of its spiritual character. A landed aristocracy is a corrupt and imperfect system; but until some other apparatus be found, and that is by no means difficult, it will be well for the progress of the human mind that a powerful check be put upon the leveling propensities.

The Catholic Church presents the symbolical model. A system of poetical personifications, such as that of ancient Egypt, Greece, and modern Rome, is the natural and organic principle of mental elevation. This principle will yet be purified and divested of all its superstitious and entralling agency. Like every other gem of vital worth in Nature, it first appears in the ore and dross of corruption; but experience removes the uncomely exterior, and gives a brilliant polish to the pebble.

Although the condition of the moderns is much more critical in respect to religion than that of the ancients, the views of the moderns are more grand and imposing. The ancient republics,

with the exception of Rome, had no idea of a universal empire,* and Rome contemplated it only as a conquest. The moderns have conceived the idea of a universal system. Campanella wrote a long treatise to the King of Spain, to point out the means by which he might attain the sovereignty of the world; and he also published a little work, called "The City of the Sun," in which he sketches an outline of a society in which there was no private property, and no indissoluble marriage. Campanella was a Dominican friar, and a reformer; a stern and shrewd opponent of the old Aristotelian school. He spent twenty-seven years of his life in prison for his opinions. His system is rude, and partakes too much of the martial and superstitious character of the age in which he lived; but it is worthy of notice, as being probably that from which the modern continental philosophers borrowed many of their peculiar opinions. It has an analytical foundation, like Plato's republic, which was based upon the elements of musical science. Campanella begins with unity, O, or Hoh, at the head; this head has three subordinate officers—power, wisdom, and love. The first presides over all martial and gymnastic affairs; the second presides over all scientific affairs; and the third over the department of the affections, such as generation, feasts, festivals, &c. Each of these has subordinate officers for different departments, and the whole machinery is dependent on universal suffrage. Property is public. Rewards and punishments are determined by the authorities. Generation is treated as a science, for the reproduction of the best models of mankind, and the ancient method recommended, of presenting always before the eye the finest sculptured and painted representations of the human form, to aid the imagination as the organic principle in the formation of the fœtus. His ideas of human beauty and perfection, of the value of strength of bone and muscle in both sexes, of the value of gymnastics and temperance, combined with intellectual exercise, are worthy of the best philosophers of modern times. His religious ideas, also, were very liberal; but the rites which he introduced into his Solarian system are too puerile even for a society of modern Mormons. But of all the ideas of Campanella none have damned his reputation so much as those respecting woman. His marriage system is exceedingly beautiful and chaste. Indeed, chastity appears to be his favorite virtue; but he seems to have considered it necessary that a class of women, whom they now call unfortunate, should always exist in society. This necessity lies in the commercial intercourses of society, carried on by sailors and travelers. These women he brands with no reproach, and all the difference between them and other women is, that they are entitled to enter into short alliances with men, which alliances are to be regarded in the light of marriages by the state. But it is only a certain species of women that are entitled to rank in this class—women who have lived for years in marriage without having children; they, therefore, never can become matrons. This is the only privilege of which they are deprived. He thus proves sterility to be a bountiful provision of Nature, calculated in a society constituted after his model, to secure the domestic peace of individuals and preserve the chastity and morality of the public. This will appear offensive or innocent to the reader, according to the colour of the glass through which he looks at it, but we believe the intentions of the author were good, whatever be the truth of his arguments, or the moral effects of his policy. These effects, however, could not be worse than our present Christian system.

Harrington's "Oceana" was written in the time of Cromwell, and he advised the Protector to institute a commonwealth upon equitable principles. But his "Oceana" is not a community, nor indeed a social system; it belongs to that class of systems from which present radicalism has descended in lineal succession. Universal suffrage, parliamentary representation, vote by ballot, are favorite panaceas with Harrington, who also preserves all the gradations of rank, subject to restrictions for the protection of the people. Harrington hankered too much after a *beau-ideal* in the law of Moses, to bring forth a perfect system, but he certainly shows, that if the Mosaic law had been carried

* Moses foretold it.

out into practice, there is much justice and popular influence in it, much more than in our present British constitution. The poor would be great gainers by a re-establishment even of the law of Moses.

Thomas Paine is evidently a disciple of Harrington. His "Rights of Man," and his "Agrarian Justice," are off-shoots to the Oceanic system. With this school originated the practical politics of the French Revolution, American Republicanism, and modern Radicalism. The theoretical Republicanism, however, was deeper than this. It was the doctrine of Plato and Campanella. The first attempt at association for the purpose of propagating this theory, was the order of the Illuminati, in Germany, under the direction of Dr. Weishaupt. The disciples of this school had very vague ideas of a practical system of equality, and easily identified themselves with the popular Republican party, so that it is scarcely possible to discriminate between the two; but the poetic genius of Rousseau, the philosophical poetry of Condorcet, and the deliberate reasoning of Godwin, on the subject of social equality and community of property, produced many converts to the new principles, and laid the foundation of a school of socialism which has been gradually ripening into methodic and practicable theory.

The resemblance between Godwin and Owen is greater in reality than in appearance. Godwin advocates the theory of universal equality, without community or co-operation. But his anti-community and anti-co-operation are curious illustrations of the manner in which extremes meet. Man in a highly cultivated and refined state, fearless of want, and capable of indulging in every innocent and dignified pursuit, by the consent and assistance of his fellow creatures, would rather consider private property as a burden, and disdain to trouble his mind with the accumulation of paltry gains, and the calculation of insignificant and dishonourable profits, wrested from his neighbours. Free to hoard if he pleased, he would disdain it as an act unworthy of his high moral and intellectual nature. This is moral, not formal, community, and is the principal difference between Owen and Godwin. It is singular, also, that, basing his system upon the principle that man has no rights, he rears a superstructure of justice and equality. He looks more to the duties than the rights of man. He denies the right of man to legislate. Man is only an interpreter of the Divine law, or the law of Nature. It is his business to study that law, and obey it. He has no right to make laws. These are beautiful principles of Godwin, but they are rather ultimate than practical principles; hence the unsatisfactory, but more practical system of Paine, in his "Rights of Man," has found many readers, and formed the minds of thousands of the present generation, and the work of Godwin is not even known amongst the people. Paine's system is more immediately possible, and therefore more intelligible; but a system which attempts to improve the moral and physical condition of man, by giving 15l. to every man who arrives at the age of twenty-one, 4l. a-year to every poor child under fourteen, or 10l. a-year to every poor man above sixty, may be better than the present system, but never can be regarded as an ultimatum. The 15l. might do good to many, but it would prove the ruin of many, who would spend it in drunkenness, and multiply crime and disease. A system which proposes to improve the condition of mankind by the distribution of money, can never be a good final system of reformation. Paine was a useful man, and saw farther than those of his generation, but his views were very confined, both in religion and politics. His principles will vanish like the mist of the morning.

The true organic principle of human regeneration belongs to socialism, the germ of which we can trace as far back as Moses. It runs down the stream of time, darkly visible and dimly seen, but still in being, and waiting the genial influence of a new era of scientific universalism and liberal intercourse, to complete its formation.

The modern attempts made by associations of reformers to re-constitute the fabric of society upon social principles began with the German Illuminati, under the leadership of Dr. Weishaupt, commonly called Spartacus Weishaupt. From this school the French philosophy and the French Revolution proceeded. This was the well-spring of modern Republicanism

and Socialism. The restoration of the religion of Nature, and the law of Nature, was the concealed object of this formidable institution, which had a secret organization of great extent, embracing names of high renown among the nobility and literati of Europe. The father of the present King of the French was one of its most distinguished members. The philosophy of Illuminism was mere declamation, consisting of common-place complaints of religion and priestcraft, politics and politicians, without any definite system that could serve as a conclusive substitute for that which they condemned. There was a negative truth about their eloquent invectives; but when the inquisitive and deep-searching mind inquired for a positive exhibition of truth, it could not be presented. It trusted, therefore, partly to complaint, and partly to intrigue and conspiracy; and although much hypothetical matter has probably been written about this mysterious combination by the Abbé Baruel, and Mr. Robinson, in his "Proofs of a Conspiracy," &c., there can be little doubt that an immense ramification of infidelity and republicanism throughout Europe was at that time under the presiding direction of a few extraordinary men in Germany and France. The campaigns of Napoleon scattered the host, many of whom regarded him in the light of a political Messiah, to establish the system for which they zealously contended.

The Revolution effected a great change on the religious and political sentiments of men. The school of Voltaire is now virtually dead. It has numerous disciples of spirit and reputation, but it is philosophically dead. Its mode of reasoning against religion is exploded. We are not aware of any theological production having issued from the press upon such principles for many years. This stillness was broken by the St. Simonian religion. Novelty alone was not the charm of Simonism. Analysis was its chief feature. It was captivating to the intellect; it was beautiful to the imagination. It presented a central point of union for all the sciences, and it threw new light on the frivolities and corruptions of religion, by representing them as temporary processes in the great work of progression planned and conducted by the power supreme—of the Mundane system. This was bringing order out of confusion. The school of Voltaire is a chaos of conflicting powers. Lessing and Condorcet conceived the idea of a science of progress, and St. Simonism is an incipient attempt to realise the idea in co-operative and systematic action.

The St. Simonians, however, were rather sanguine; the surprising success which their apostleship enjoyed was the ruin of their mushroom institution. They wanted policy. They startled the people, with offering them strong food, instead of milk and herbs—their ranks were speedily divided, and the King of the French sent out his gens d'armes after the dispersed flock.

Amongst the deficiencies peculiar to the St. Simonian doctrine is its religious character. It is not sufficiently definite and precise in its analysis of religious progression. Bazar, the author of the chart and the principal outlines of the system, was evidently highly gifted as a universal analyst; but the religion of Christendom, *i. e.*, of civilization, requires a special analysis. Philosophy despises it, and would, if possible, trample on it, or forget it, being fully confident of its own sufficiency to do without it; but philosophy is not the only party to be consulted. Were all men merely philosophers—that is what the French used to call philosophers, philosophy might have good reason to urge the absolute obliteration of the idea of Christianity as a material of thought; but a large proportion of men in Christendom are Christians, and all governments profess the name. It therefore follows, that the religion of Christendom, as the leading system of popular thought, deserves a most special analysis in an analytical system, such as St. Simonism was. St. Simonism did not give that analysis. It gave no substantial reason for the religious process through which society has moved, by showing the harmony that subsists between that process and other departments of universal Nature. It left it chaotic and fortuitous. The religious department is that of organization and design. It neglected this department for the sake of vulgar philosophy, which is chaotic, and from a well-grounded fear of being esteemed too religious, it clothed itself with a religious name, without presenting a

sufficiently definite and intelligible religion. Thus it failed; but it has sowed the seeds of true philosophy in Europe, which in due time will take root, and bring forth fruit abundantly.

Owenism has taken a different direction, but still in advance of the old philosophy of the 18th century. The doctrine of Necessity, which characterizes the Owenian system, is the nearest possible approximation to a universal organic principle, but the manner in which that principle is presented, excludes the idea of analysis. If physical necessity have a meaning at all, it must mean, that Nature is an infinite accident, controlled only by opposing powers, and governed by no methodic purpose. Owenism has therefore very consistently dispensed with the science of progress, and contents itself with Nature, as it is in a moment of time, without any systematic knowledge of what it has been, and consequently with no satisfactory knowledge of what it will be, for time is threefold, and cannot be partitively reviewed in a universal philosophy. "Necessity" teaches charity, and it teaches the important doctrine of "circumstances," or the influence of political and social condition and education, in forming the human character; thus leading directly to active external arrangements and instruction for removing human imperfections, instead of the olden system of correcting them by the severities of penal discipline.

These two are the last and greatest exhibitions of socialism, and perhaps the only two of public notoriety that are entitled to the name of a social system. They are both based upon a religious principle. Owenism on the religious principle of the formation of character upon the basis of philosophical necessity, and St. Simonism on the religious principle of universal unity and harmony, and the law of progress, which pushes society forward to universal association.

The latter is the most imaginative of the two. It gave a conspicuous place to the productions of the fancy, and provided ample means for supplying the deficiency of patronage to the fine arts, which would necessarily be the result of a mere mechanical equality. It was peculiarly elegant, but it wanted honest and simple artifice. There was abundance of zeal and noble resolution. The theory was sublime, and the intentions were benevolent; but it is a law of Nature, that all growth shall begin at the root, and that a house shall not be built by beginning at the chimney tops. The material or mechanical process is evidently the first in order. The imaginative is a superstructure, to be reared *upon* the foundation—not a foundation upon which to build, *i. e.*, practically.

In this latter respect, therefore, Owenism is to all appearance the most natural and probable basis of a social system. Its very materiality and mechanical character are strong arguments to us in favour of this hypothesis. It is physical throughout. Its first principle is physical necessity, and its whole philosophy is the influence of physical arrangements on the character of man. This we say is the natural order of growth—the root grows first—the body of the child is first developed—the material in progression or edification is in advance of the spiritual, always pre-supposing the spiritual antecedent who contrives and regulates the process. Every vegetative root has two polar extremes; the radicle and the plumula. The radicle takes root in the earth; the plumula ascends into heaven. The body connects itself with the material elements of Nature; the spirit ascends into the new creation of fancy. It is an ascending process, from low to high, and not a descending process, from high to low. We therefore do not deny the possibility of Owenism being the commencement of a new era in the history of man. All that we maintain is this, that it is only a commencement, and that it cannot progress far with such a material and mechanical character. It has many new habits to put on before it be arrayed in attractive style to allure the imagination, and capture the affections; and those robes to which we allude are merely the antecedent principles of high poetic and religious feeling, in which socialism theoretically commenced, and in which it must practically terminate. The religious feeling is the beginning and the end, the first and the last. It is the divine representative, but the material department is the root of political growth. Each fulfils its office. The first electrified the world with its vivid representations of universal order and harmony; but it was not adapted for taking root in

the earth. The second is adapted for taking root in the earth, but not for captivating the fancy. It therefore has a *quickening* to encounter, before it can prosper and be entitled to the name of an organized and healthy system. May it live to see that quickening—the shooting of its plumula! We shall rejoice to know that its present materialism is the radicle of the *New Moral World*, and that no other radicle will be required. But no prosperity can attend it, and no beauty can ever recommend it, until its terraqueous materialism be clothed, and its nakedness concealed from the aspiring soul of man.

MYSTICISM AND RELIGION.

ONE word before the leaves of the *Shepherd* are finally closed, and the communion of the readers entirely ceases, seems due to the sacredness of that feeling which the word "religion" is usually employed to express, for the purpose of showing its relation to "mysticism."

Is that relation one of opposition, of contrariety, or of coincidence? To answer this question we must seek, first, the elements involved in the two ideas. For religion some other person should answer, as I undertake to give a version of mysticism; but, as the *Shepherd* does not yet keep open school, I must answer as well as I am able.

Religion is, according to the best common view of the matter, a system of obedience to a divinely derived authority, established among mankind for the double purpose of keeping men in moral order upon earth, and of qualifying them for a future state, by informing them of its existence, and annexing certain consequences to themselves in such future state, from certain kinds of conduct in the present state.

The complication of subsidiary ideas in this state of mind it is not very easy to determine.

What a divinely derived authority is, how it comes, to whom it comes, in what shape it comes, are questions which should first be answered, before the difference between a Religionist and a Mystic can be wholly and clearly explained.

Another point, deemed of the highest importance by many, indeed by most persons, in the English section of the religious world, is the annexation of the divinely derived authority to a written or printed book, which is pre-eminently called the Scriptures.

At present it is, and for many years it has been, the point of highest debate, and the fiercest contention among the best-educated portion of English society, whether the Scriptures we possess have such divine authority.

Upon this, though a mere opinion, hard names are bandied about, and hard treatment is enacted. Among those who are agreed upon the general point of authority, the varieties of mental construction are very great, though the point on which they agree is probably that on which they are farthest from the truth.

They deem it of the highest importance to establish the truth of that, which, if its establishment depend upon their truth-proving, is of no value whatever. Unless the Scriptures be self-evident, they cannot be of divine authority. They who set about proving their truth, declare by that very act itself, that the Scriptures are not self-evidently true. If any assertion, proposition, or action, be taken from the self-evident ground, it must be placed lower down, and it is necessary to seek some other position which is self-evident. Of course, as we increase the weight of our proofs and the importance of the subject to be proved, we enhance the value of the pre-existing self-evident position. Now by making the Scriptures the subject of proof, so overlaid, so zealous, and so important as our religionists do, they have exalted some other authority as self-evident at the expense and cost of the Scriptures, which they accordingly place in a secondary position. For it is absolutely necessary, even in the most admittedly exact sciences, to begin the chain of proof with the self-evidently true. Axioms stand before problems, propositions, and questions.

I have followed out this one instance to show how widely and how wildly religious men run away from the standard and mark which even themselves have chosen and set up. Perhaps, by

the way, their running away is in consequence of the position having been their choice, and not having chosen them. Like other blunderers, they have none but themselves to blame for their mishaps, none but themselves need be mended to avoid future blunders and mishaps.

This conduct of the Scriptural religionists is only comparable in absurdity to the soldiers who should go abroad and fight for an act of parliament, or a royal proclamation, forgetting the nation or the king, who in the mean time might be ruined, whose will could not be in, nor its expressions, but merely the record of the expressions of the national or royal will in such documents, in a modified way, for purposes suited to the occasion.

Of all the notions become vulgar and current by means of religious instruction, which is allowed to supersede mystic development, that of the interior life being future, appears to me one of the most fatal stumbling-blocks to harmonious progress.

I do not allude to what many would call the evil consequences arising out of the supposition that any vice may be committed, so it be verbally repented of before death. It is not mere consequences I speak against.

If great care is taken to instruct and impress me that a certain door, say of the baker's shop, is not open until twelve o'clock at noon, the probability is, that reliance on my teachers, combined with laziness, will overcome my appetite, and I shall never so much as cross the way to try if the baker has unfashioned his door, or if he will open when I knock.

It is the universal language to say "the world to come," "a future state," and similar expressions, opposed to the fact of there being but one great, eternal, NOW.

This is, of course, only the companion or counterpart of the idea of heaven and hell being places. But this notion is now growing obsolete, and the *Shepherd* could not join in a more benevolent work than that of endeavouring to bury the false notions of a time-like eternity in the same grave with those of a physical universal space.

But to recur to our principal inquiry.

In opposition to what is said above of religion, it is to be observed of Mysticism, that it is the tendency to become divinely instigated. Divine instinct does that in the mystic nature which we all understand to be done in animal nature, in the trees, as well as in electricity, magnetism, &c. &c.

Religion is a natural, or conventional, or secular form, by which external evil is kept in a sort of superstitious order. It is a political law, useful to political governments. Intellectual religion is the scientific mode of the understanding, helping the self-will to regulate its own disorders.

Mysticism is a divine law working in a divine end. Intellectual mysticism is the scientific mode of the will in submission to eternal order.

Religion applies to one, or to the few. Mysticism declares itself to all.

Religion argues and persuades. Mysticism resists its factness; it is the "I AM" fact.

Religion is an outward mental activity, with a profession of belief, trying by rules, and rites, and ceremonies, to introduce man to God.

Mysticism is an inward divine operation; a principle of life, by which God introduces himself into man.

Of religion man is the priest, the supporter, and maintainer. By mysticism, God is the priest, supporter, and maintainer of man. Religion begins with man, as all history has shown, and from the roughest barbarism to the state of highest refinement, it is the same thing modified in an endless way. The South Sea Islander's wooden post, the Greek's marble, or ivory sculpture, the Briton's printed book and carved creed, are but modes of that which each sect properly calls in every other one—idolatry. Yet to every one it is true religion. Mysticism, on the other hand, begins not with man, but with divinity, and this cannot be before divinity becomes man.

All Nature, internal and external, is but a want or desire. If in outward nature, the animal or the tree is placed in such conditions that it cannot present to the life within those offerings which are in harmony with the life, the life destroys the living forms it would otherwise support. Thus a starved animal, or a tree in a dark cellar, would, as we call it, die.

If man, in his moral nature, desires the undesirable, his presentations to the life are of such a sort as to bring on unhappiness or moral death. If he desire the desirable, happiness, or divine life, with the perception of the universal harmony is the result.

Upon making a summary of what is here set forth, the contrariety of religion and mysticism will plainly appear. The points wherein they coincide, it is not worth while, on the present occasion, to seek out.

RELIGION.

Divine authority asserted.
Intellectually proved.
Time and space.
Scriptural literal records.
Interior life only future.
Political and scientific forms and ceremonies.
Individual.
Outwardly active.
Man to God.
Man the priest.
Disharmony and unhappiness.

MYSTICISM.

Divine instinct actuating.
Self-evident.
Eternity and state.
The life-giving spirit.
Interior life now.
Divine and or genesis, or genesis in man.
Universal.
Inwardly creative.
God to man.
God the priest.
Harmony and happiness.

Until the *Shepherd's* arrangements are made for bringing his readers and friends face to face, of collecting his sheep into an actual fold, "taking the lambs into his arms, and gently leading those who are with young," the above is submitted for their consideration. When that desirable consummation shall be achieved, the writer hopes to become a member of the thinking class in the new school, when, "hearing them and asking them questions," and being questioned in turn, will afford to all the gratification of probing, dissecting, and reforming.

A MYSTIC.

OWENIAN OBJECTIONS.

As we have now done with our Owenian friends, and have nothing more of much importance to say—if what we have already written be not misunderstood—we refer those who are willing to examine the controversy between the two parties to our Universal Chart, where an outline of our doctrine is drawn up, as short and clear as we could express it. The differences between the two parties, like almost all differences between extremes, may be reduced into a very small compass. That small compass, however, is of vital importance: we call it the spinal marrow of human society. We cannot even form an idea of a universal philosophy without it. We are certain that no curious and inquisitive mind could ever feel satisfied with the philosophical basis of any social system professing universality, which broke the golden chain of progressive providence, and pretended to explain the phenomena of natural progression by refusing to explain them, or by asserting the impossibility of analyzing them. If the laws of Nature be wise now, they were wise formerly; and, if not wise formerly, then we can have no confidence in them hereafter. Past, present, and future, are one time, and their phenomena are one indivisible act of the Divine mind. The present is the offspring of the past, and the future of the present. They will all be scientifically connected at last, and the ways of God be vindicated before the tribunal of the human mind. All the rivers of thought and activity, therefore, must run into the appointed channel—that channel which has run through the field of human society from its earliest being, and which even now is enlarging its measure, and making vast preparations for a universal coalition, by reducing the subject of controversy within the limits of a single dispensation.

That single dispensation is now indeed a scene of dire confusion; but still it is the sovereign dispensation of old society, and its use in the economy of the divine government must be vindicated. Till then it will stand, and the burning zeal of Divine inspiration, through ten thousand different modes of doctrinal opinion, will support it, till its legitimate successor declare itself, by embracing it as its parent and superseding it as its heir. This is a fact founded upon universal nature. There can be nothing new either in religion, science, or politics. The present

is merely an expansion of the past—the future an eternal shooting out of the past and the present.

When Paul, the great expounder of Christianity—in fact, the doctrinal founder of it—abolished the law of Moses, he merely sublimated it, as a chemist would express himself. "It is written," said he, "Thou shalt not muzzle the mouth of the ox that treadeth out the corn. Doth God take care of oxen, or saith he it altogether for our sakes?—for our sakes, no doubt, this was written, that he that ploweth should plough in hope, and that he that thresheth in hope should be partaker of his hope." The old Jews carried the law of the ox no farther than the ox. They seemed to have no idea of the spirit of it; yet, in that very commandment, is concealed all the philosophy of modern Radicalism, in so far as the rights of the labourer are concerned. In the same spirit of analysis, speaking of the history of the church, as recorded in the Old Testament, he says, "All these things happened unto them as *types* (*typoi*—our translators say "enamples"),—and they are written for our admonition upon whom the ends of the world are come." These types he analyzes as a chemist would analyze a material substance to bring an essence out of it, and in doing so he succeeded, for he acted according to *Nature*. But an essence itself may be analyzed. There is no end to analysis. We have merely the same mode of operation to perform. This is the universal law. This is the legitimate hereditary successorship of Nature, and we feel confident that she will bestow her patronage upon no other.

We do not mean to say that something else is not necessary than this analytical and legitimate successorship of religion, which we have now explained. There is a political department which belongs to the law, which is of equal importance with that which belongs to the church. Law is a divine institution of equal importance with the Ecclesiastical department. The affairs of the body, the provision for its wants, and the protection of its rights, are its peculiar province. Lawyers are servants of God as well as priests, but their department is different: the one has the sphere of body, the other that of mind, to superintend. The laws of every country contain the germ of universal justice, concealed in the rubbish of temporary artifices, rendered necessary in times of confusion, or employed by selfishness for private aggrandizement and the grinding of the poor. The whole land, for instance, may be proved to belong to the crown, and the crown to the people. Here is social justice and the universal law in an instant. A *true* lawyer will bring out this universal law. A *false* lawyer adheres to the current practices of the poor man's oppressors. A *true* priest will bring out the universal gospel, teach it to the poor, and enjoin it upon the rich. A *false* priest leagues with the rich, and supports the system of extortion. Even the law must be vindicated. We have so exalted an idea of the future condition of the world in its socialized state, that we believe it impossible for that condition to be realized until both law and gospel be satisfied, that the new system is their own *bona fide* legitimate heir, taken from their own loins and nourished in their own bowels.

The law, however, being the material department, is the political root, but not the maternal womb of social organization. It contains the original organic principle, but it is only by going into a new sphere that it can reproduce the image of itself. That sphere is a sphere of feeling and weakness, but powerful in weakness, for by it alone can a perfect organization be produced; external arrangements may create a show of unity, but it is only by the mystic sphere of imagination that the union can be perfected. It is the inner man that finishes the child.*

Man will be a rude uncultivated being as long as he continues subject to the material department only, and measures all his wants by the cravings of his animal nature. He is an animal first, and a man at last; and the farther removed the man is from the mere animal standard, the more noble and

beautiful he becomes. There is nothing more disgusting than a mere eating and drinking association. No one denies the necessity for such things as food, clothing, and lodging; but a system which dwells intensely upon these material bases, and exclusively directs the attention of its disciples to them, is by no means calculated to rise high in the scale of being. By philosophically despising the charm of the indescribable principle which distinguishes man from the animal creation, viz., the *imaginative principle*, we lose the power which belongs to that principle by birthright for ever. Material philosophy is the Ishmael—the Esau of humanity. Spiritual philosophy is the Isaac—the Jacob; and all the world knows that according to the destiny of these two pairs the elder was ordained to serve the younger. This is merely the law of Nature—the universal law modeled in the history of two individuals.

We also allow that the elder is stronger than the younger. But it has no occasion to boast of its strength, for, in spite of mystery, the weakest powers in Nature are the strongest. "Strength is made perfect in weakness." Mechanics began with good solid matter. What can be stronger than iron; than levers, pulleys, screws, &c.? Gas is stronger, wind is stronger, breath is stronger!! Now gas (*pure*) is invisible. The levers, pulleys, screws, wheels, and axles, are now the servants of one of the weakest elements! Moreover, that extraordinary power called gravitation, by which all Nature is so perfectly secured, is so weak that, as Dr. Faraday says, it requires *planets* to manifest it. Were it strong it would draw us into the earth, we could not lift our legs on the surface of the ground. Its power lies in its universality. Upon the same principle, we in our philosophy rise up from matter, the strongest in detail, to imagination, the strongest in universality. And in perfect harmony with universal fact, we maintain that our universal philosophy must absorb all the incipient efforts of Materialism, and employ them as gas does the levers and paddles of iron. You may prove the power and the strength of Materialism if you please. Granted by us. Only follow the universal law with us, and we will make it as clear as day-light that the weakest is the strongest.

In all this we are not so much opposing our social friends as endeavouring to show them how they may be supplied with an additional power, i. e., *weakness*!!

LETTER TO THE EDITOR.

[We have received many letters from our friends in town and country, in consequence of the approaching termination of the *Shepherd*; and from them we are gratified to find that we have not been writing in vain. The following is a specimen, which we have selected—first, because it is well written—second, because it is better calculated for the general reader than those of a more private and personal character. We do not know the writer, and were it not that the letter has the "Bayswater" post mark upon it, we could have no idea of what point of the compass or locality of the known world it originally came from. It is enough for us to know that it is from a reader of the *Shepherd*.]

DEAR SHEPHERD,—I read your announcement of retiring from office again with a faint heart. It is not a mere regretting—my soul descends to sorrow and mortification; it comes very suddenly and unexpectedly upon me, at the very moment I was exulting at what I interpreted into such visible prospect of a growing success. I had the vanity to persuade myself our cause was getting on most triumphantly—that your appointment was about to be ratified; that your office was ripening into an establishment; that your pastorage had become so extended and improved that its rising importance would secure us against the chance of losing you. But, alas! for these dreams of verity, these hopes of rising into a something, these prospects of attaining or approaching to a reality, it seems are all to be obscured again. Our sun is once more to be seen setting; the little flock is again to be exposed to the dreary waste—again to be left to cater for their ill-understood supplies—to roam the mazy desert in search of precarious food.

But, why trouble you with this lament? If I am thus deceived, I have but to thank myself. You, from knowing

* This is a beautiful natural type of our universal doctrine. The female is called by anatomists a male developed inwardly. There are even many instances on record, whether true or not we know not, of females becoming males after birth.

better, are fully competent to decide, and I am quite confident are directed by the very best of motives, as well as governed by a sound judgment in the resolution you take; but I, who happen to live in the country, (and no doubt many more who have to boast of belonging to the same flock) become anxious to know whether, in your kind and considerate intentions of providing for your sheep in town, you have quite forgotten those who live in the country. I confess for one, that I have a thirsty soul for such things, and shall certainly feel no little craving after what I have acquired a peculiar taste for, and shall feel some hardship at being left to pine after what you are giving away by wholesale to other sheep of the same flock, merely, too, because we cannot be gathered into the same fold. I hope, therefore, I may be excused for endeavouring to draw your attention to our case. We should, I feel confident, be most thankful, could we be fed with the same diet which will be regularly provided for your lecture-room table, could some means be devised for making it up into some portable shape, say somewhat as near the old way as possible. A little suspension to this, to enable you to recruit yourself, and lay in a fresh store of provision, is most fair and reasonable, and a privation that will be most cheerfully submitted to.

In the fullest confidence that this country petition will not fail to intercede for us to the extent of your ability, I have only in conclusion, to avail myself of the opportunity it affords me, for offering you my very hearty congratulations upon the honourable elevation you have attained in our social edifice.

I can but feel proud in considering myself a fellow socialist of the same school—a brother of the same nature, and a member of the same man. I acknowledge myself most essentially indebted to you for those great and important duties and services of which you have so ably, so honorably, and so honestly laboured to acquit yourself; and beg to subscribe myself in great sincerity and esteem,

Dear Shepherd, yours in true fellowship,
March 1st, 1838. AMICUS.

THE SEVEN ORDERS.

(In Answer to a Correspondent.)

MAN has no right to make laws, his business is to study and obey the universal law; he may use temporary expedients in certain emergencies, but these are not worthy of the name of laws. Upon the same principle man has no right to make creeds; his business is to study and propagate the everlasting gospel in thought, word, and deed. Every man, therefore, is his own lawyer and his own priest. But expedients must always be used in an imperfect condition. These expedients should be committed to the management of those who best understand the *universal law* and the *everlasting gospel*. The law superintends the external arrangements of art, industry and public intercourse. The gospel superintends the department of imagination, beginning with the fine arts, and rising upwards as high as the human fancy delights to soar, with this proviso, that it never trespass against the precepts of the universal law. No state of society can be respectable without these two departments.

Such is the natural distinction between a lawyer and a priest. The former has always taken the most active part in the external arrangements of society; the latter has always exercised an indirect influence through the medium of the affections and the imaginative faculties. The former is more masculine; the latter more feminine in its character, but each is an essentially distinct and irremovable order in society. The only legitimate object of reformation is to perfect them—to unfetter them—not to destroy them. That every man will be his own priest in a state of perfection, is as true as that he will be his own lawyer, his own physician, his own gardener, his own teacher. But, although every man has the office of lawyer and priest to fulfil in his own person, there are degrees of excellence which necessarily give the lead in the career of human progress, and superiority in relative influence, to some individuals. This superiority gives them their title.

Our Correspondent has asked what a priest will or can do in

such a state of society as that we contemplate. We reply, it will take the very highest order of humanity to make a priest, and his office is the most important office in society. He is at the head of the imaginative department, and his office is the *moral*, the *taste*, the *chastity*, the *unity* of all that is employed by the muses and the graces to elevate the fancy and adorn the manners. We cannot conceive a tolerably *decent* system of society which has not an institution calculated to give encouragement to this *finest* and *purest* department of human industry. He who can superintend it must be imaginatively, if not practically, an artist. He must have the soul of the painter, the poet, the musician, the architect, the sculptor; he must be a man of pure taste and correct morals, and he must know how to arrange and employ all the various departments of his visionary empire, so as to better the moral and spiritual character of the people. There is no office in society more important than this. No association of men can be even respectable without it. Even materialism itself must have a priest of this order. The name we care nothing about, we choose the word for its universality. No priest has ever yet fulfilled this character. But it is vain to deny that this is the true priesthood. The lawyer is more connected with art and industry, and public order, than with fine art and moral culture. The relationship between him and the priest is very intimate, but the distinction is as obvious as that of the two sexes, and is admitted into all languages. If we were obliged to choose new words, we should substitute poet for priest. But this does not satisfy. The man of pure taste and refinement is always passively, not always actively, a poet. Working or practical poets are often very slovenly fellows, with bad ears for music, like Sir Walter Scott, and rude imperious manners and tempers, like Byron; madmen, like Rousseau; and cat-witted, crack-brained mercurialists, like many others. The passive poet *feels* the poetry, and acts the poet in his life and manners. This is the priest we mean; he may be a writing poet, and he may be incapable of writing a single stanza.

A poet, therefore, is an artist. A priest is passively every species of artist. The three classes are perfectly distinguishable; and though one man may belong to all, yet he must, in an especial sense, belong to one only.

The difference between men of learning and science is very obvious. Learning is principally an acquisition of the memory; a knowledge of what others have done; a knowledge of books, of history, antiquities, &c. Science, in the usual acceptation of the word, is a practical department of mental industry, which analyzes Nature as it reveals itself to the senses, and investigates the laws of universal being by personal experience and observation. A man may have much learning, and little practical science, and *vice versa*, much practical science and little learning. No possible organization of society can remove the distinction between the two.

Artizans and negotiators are equally distinct. A negotiator is a middle man—a distributor. In every conceivable state of existence such members of society must be necessary. Their modes of employment, their relationship to producers in general may be infinitely diversified. But even in a community such as that of Owen, or of Godwin, they are indispensable.

The seven, therefore, are not only distinct, but they are all indispensable. Even in a state of pure materialism, such as Materialists in general interpret it, the priest and the lawyer, as we have shown, are necessary. The name of priest may be changed, but the office belongs to Nature. Materialism keeps it down, sectarianism keeps it down; both profane it. But it is indestructible, and will rise with the elevation of the human mind, and the sanctification of the human character.

CONDITIONS OF SOCIAL INDUSTRY.

THE following is the note belonging to Abel Transon's Exposition of Fourier's Social System, which we omitted in page 147; but having lent the original to a friend, we were not able to supply the omission so soon as we promised.

1. A mechanism of industrial attraction, creating attachment and enthusiasm for agriculture and the arts.
2. Arrangements opposed to our present methods, such as

employment in short sittings, variegated, and systematically connected.

3. Satisfactory distribution to each, with dividends allotted separately to the three faculties—capital, labour, and talent.

4. Association the most numerous, avoiding the two extremes of too many and too few labourers. Deliberate determination of the most convenient number to bring together.

5. Guarantee to every one of several employments, at pleasure, and not of one only without attraction for the workman.

6. Application to three active classes, called (*sauvages*) unsocial—rich, idle, young. Guarantee of their spontaneous adhesion.

7. The power of local experience, and the sufficiency of a single attempt to produce general emulation.

8. Mechanism of discords, aversions, antipathies, and inequalities, rendered useful by indirect co-operation.

9. Free development of passions, characters, and instincts, with checks to excess, by the profusion of pleasures.

10. Union of two interests, collective and individual, always opposed in civilization.

11. Mechanism of graduated distribution, raising the means of enjoyment according to the inequalities of taste.

12. Guarantee of truth in all individual relationships, and of fortune by the practice of justice and virtue.

13. Advance of a decent minimum, repayable by the produce of attractive industry.

14. Education uniform (*unitaire*), free, solicited by the pupils, reciprocally attractive, (that is to say, for masters as well as for pupils,) and furnished to all classes.

15. Union of social mechanism with the restoration of climates, and with sanitary regulations (extirpation of plagues, miasma, &c.)

16. "*Pisaller*" (*which we shall translate*) the lowest of all motives—enormous benefit for the founders.

17. Equilibrium of population without coercive means. (Malthus has reproached our economists for their want of skill in this problem.)

18. Guarantee of the establishment of unity of action in language, weights and measures, monies, alphabet, typography, &c.

Such is the ground plan upon which M. Fourier invites the sound critic to discuss his own theory, and all those that may be proposed upon the subject of association.

REMARKS ON LUNAR INFLUENCE.

[The following is from a Correspondent, whose former articles were somewhat too mystical for insertion; we insert the present to atone for past rejection. His idea of the relationship between mind and matter is in accordance with our own—asserting the supremacy of the former, and the mere instrumentality of the latter. Being an astronomer by profession, he has not gone out of his *own* sphere, if he has overleaped the boundaries of more imprisoned minds. But, who can set bounds to a human spirit?]

THE moon has a natural influence upon the waters of our globe or planet, which is evident to all the world; so has the sun, and every other body in the heavens, in proportion to their *nature, magnitude, and distance*. This is agreeable to the fixed laws of gravity, according to which, every part or portion of the material world is governed; but the same influence is equally exerted upon the solid parts of the earth; and the only reason why its effects on them are not so evident and perceptible is, because they do not possess the property of fluidity. As to the periodical affections of lunatics or maniacs, which some may suppose to be incontestable evidences, that natural influences govern spiritual things, such as the faculty of reasoning, &c. in man, this is an appearance of nature, and a mere fallacy of the senses; for it is an established law of creation, which holds good in every possible case, that spirit flows into, and operates upon matter, and not matter that flows into and operates upon spirit. It appears, indeed, as if there were a certain natural influx or influence proceeding from the moon, which regulated and governed the rational powers of some individuals, and in others destroyed them altogether: but this is a mistake; natural or

material things can only operate upon what is natural in man, viz., upon the material substances which compose or constitute his bodily frame, and by no means upon the faculty of rationality, which in itself is above the sphere of nature, and consequently secure from all the assaults and storms of this lower world.

Nevertheless, if the material substances of the brain, with the fluids contained therein, "be not in a perfect state" at the moment of the birth of any individual, (at which important period it comes into contact with a different element, and thereby becomes a recipient vessel of planetary influx, being divested of its material medium, through which it had hitherto previously received life,) or otherwise, if it suffers by any accident afterwards, so as to injure or derange the brain, in that case, certainly the faculty of reason, which expressly belongs to the immortal soul, cannot descend into, and be properly received by the brain, (being in a disorganized or imperfect state,) but is obstructed, perverted, and irregularly transmitted to the speech and action.

Stroudwater.

PHILIP WOOD, ASTRONOMER.

ST. SIMONIANS.

STRANGE as it may appear, the St. Simonian Utopia implied the existence of a sovereign pontiff, and of an episcopacy of priests; it also required auricular confession, and it was, while searching out the means most conducive to the material prosperity of the human race that these speculators became convinced of the temporal utility of those popish inventions. But, before arriving thus far, the St. Simonians had made profound investigations in political economy, from which the statesman, who studies their earlier productions, may receive much information. Before they propagated their new worship they had explored all the sources of national wealth; and France is indebted to them for the weakening of those prejudices which have frequently obscured the views of many of her rulers. They almost entirely destroyed the sort of superstitious veneration so long entertained in this country for the system of the sinking fund—by them the system of commercial restrictions was first strongly attacked; and through their influence, railroads combined with immense internal improvement, became popular with our neighbours. The strong impulse given on the other side of the channel to industry and commerce, and the adoption by government of more enlightened and more liberal views, may in part be attributed to their first writings. They have thus acquired some title to the gratitude of their countrymen; and, although their system in the last and most logical of its forms tended directly to produce frightful immorality, and the destruction of all the rights of property, yet we are bound, in candour to admit, that they have concentrated a stronger phalanx of youthful talent, and a greater mass of historical science and practical knowledge, than had ever before been brought to bear upon the illustration of political economy. —*Dublin Review*, No. 7.

CORRESPONDENTS.

A. V.—*There can be no doubt that, up to the accession of the present ministry to office, the government of this country has been illiberal and intolerant in respect to religious opinions, but ever since the Reformation there has been an uninterrupted succession of deistical writers, who were never proscribed, and whose writings have been generally perused by the clergy themselves.*

THE SHEPHERD.

A CRITICO-THEOLOGICAL, SOCIAL, AND MISCELLANEOUS PERIODICAL, CONDUCTED UPON THE PRINCIPLES OF

Universal Faith, or Universalism.

BY THE REV. J. E. SMITH, A. M., AND OTHERS.

"ALL THEOLOGY DEPENDS ON MASTERING THE TERM, NATURE."—*Samuel Taylor Coleridge.*

"THE LIBERAL MAN DEVISETH LIBERAL THINGS, AND BY LIBERAL THINGS SHALL HE STAND."—*Bible.*

No. 40, Vol. III.]

SATURDAY, MARCH 31, 1838.

[PRICE 1 $\frac{1}{4}$ d.]

THE EDITOR'S FAREWELL.

I HAVE NOW completed the *Shepherd*. It consists of one hundred numbers *in toto*. I intended originally to make two volumes of it. It has undesignedly divided itself into three. One of the three is very little, but it is well protected between its two larger brethren.

It does not become me to speak of the merits of the work, and it is natural to suppose that I must be blind to many of its faults. Insensible to its faults, however, I am not. I never can read a page of its contents without severely criticising and correcting it. In doing so, I do not correct the original principles upon which it is based, but merely the manner in which I have endeavoured to convey those principles to the understanding of the reader. Too eager sometimes to be plain and instructive, I have inveigled the argument by unnecessary labour, which has tended to obscure it; or, over anxious to be concise, I have broken the chain of easy transition which ought to lead the reader smoothly forward from one idea to another. Many gaps of this latter description I perceive, which might have been avoided under other circumstances, and which would have been filled up, had it been a book, and not a weekly publication, I was writing. But, with all its faults, I have no reason to be ashamed of the *Shepherd*, as it contains truths amply sufficient to atone for its imperfections.

I have no hesitation in saying that I have laid down in the *Shepherd* the fundamental principles of the science of universal analogy, in a more definite and intelligible form than ever has been done before. I have had no precursor to render me the slightest assistance—to supply me with terms, and aid me in the choice of expressions. Neither theologian nor *savant* has plowed the field before me, or even removed the stones to smooth the progress of the ploughshare. I never read a single author who took so broad, so high, and so low a view of universal Nature as I. This will account for many of my faults, inasmuch as my efforts are merely the incipient efforts of an infantine science.

Despising nothing which God has employed as a subsidiary power in the government of society, I have embraced universal existence, and determined the relative importance of powers by their relative influence in the dispensations of Providence, and simply concluded that the greatest power is the greatest instrument for bringing about the ends of wisdom and goodness.

This power, which is evidently, in our planet, the Jewish and Christian dispensation, I never have regarded as *the end*, but merely as a means for promoting an end. The end, as my friend the Mystic observed last week, is a self-evident fact, a fact which requires no demonstration, which needs not the arguments of priests and commentators to prove it, or the learning of divines to varnish it with a spurious respectability. It is a pure and experienced blessing—a blessing which, when a man has found, he will for ever preserve and cherish as the apple of his eye. A redemption that is doubtful is not redemption. A state of suspense is sometimes worse than the evil we forebode. The world never will dispute the reality of the true redemption when it arrives.

But as man is the ostensible agent of his own redemption, it

is necessary that we should mentally foresee the end, and come to a common understanding respecting the means of its accomplishment. This is my belief, and in this belief I have endeavoured to reveal the beautiful and harmonious method of the divine mind in the drama of universal history, showing how the various movements of the spirit concentrate in one dispensation, and finally break out into a system of universal love, forgiveness, and peace, both in external society and religious opinion.

It does not satisfy my all-roaming mind to show me the probability or necessity of this in what is vaguely called the nature of things by some, or divine instinct by others; I seek satisfaction for my understanding in the *process* of Nature's maternal providence. I do not consider that botany can be understood by merely examining the character of a full-grown flower, or a tree that has arrived to its prime. They must be watched from the earliest period of their existence, from the deposition of the seed in the bowels of the earth till the greatest development of the vegetative germ. He only knows the flower who knows it thus; and this is the knowledge I seek, and the knowledge I shall have—the knowledge of the *process* of Divine wisdom in the formation of organic systems.

Much has been said and done to convince me of the folly and vanity of this knowledge, but it is vain to attempt to persuade me that my own vision is not vision, that my ears are not ears, and that I do not smell with my nose. The last effect of opposition might be to drive me from society with disgust as a misanthrope, but never to convince me that this is not the highest order of science and wisdom. Imperfections in myself I acknowledge without number; but the principles of universalism, as laid down in the *Chart*, are more deeply rooted in my heart, and soul, and mind, than ever.

Yet I do not disagree with those who maintain that wisdom is to be sought in the nature of things—in facts, in science. This is my own school. The only difference between me and such material philosophers is, that my school is somewhat larger, including universal *Providence* as the living and acting portion of universal *being*. Nor do I disagree with the Mystic, who declares that Mysticism is the inward life, and what is called religion, *i. e.*, doctrinal religion, is only the outward sphere. This is very true, but in universal philosophy I include both inward and outward, and never will I despise a work of God because it is revealed in the organizations of matter. This very outward, which is so much despised, is God's own temple, in which all the wonders of creative wisdom are manifested. The inward nature may worship in this temple, but out of it it cannot go; and the more it observes the wonders this temple contains, the more divine and beautiful itself appears.

I make these declarations as delicately as possible, because controversy has now ceased, and my sole object at present is merely to satisfy the reader that I firmly adhere to the bipolar view of truth with which I set out. I cannot conceive another. My imagination fails in presenting an idea of it to my mind. Materialism I cannot understand. It seems to be a caricature. I can scarcely believe that there is a Materialist in existence. I am rather inclined to think that he has not considered the subject, and that he has hastily assumed a name without being aware of the absurdity that it conveys. A Spiritualist is more

intelligible; but a Spiritualist who believes in the possibility of spiritual being, without an external world, is to me equally inconceivable as his material counterpart. I can imagine a spiritual being creating a world for itself, as the mind does in a dream, but that world is external to it as soon as it is created. The mind sees, hears, and feels the creations of its own fancy. But life without perception is an absurdity, and the idea does not deserve a serious confutation. I cannot, therefore, see any other pillars of truth than the two I have chosen.

Moreover, if I confine myself to truth *now*, without relation to time and place, I cease to be universal, and at the same time attempt an impossibility; for although the present is the only reality to us, it is so complete a nothing that the Hebrews had not even a present tense to express it. Space is the sphere of perception. We are creatures of space. I cannot speak or write a syllable which has no relation to it. I cannot receive an idea which is not dependent for its existence upon it. Were I not conscious that those who talk about "being" out of time and space, were perfectly serious, I should regard what they say as a species of solemn waggery.

Were I to confine myself to science in its vulgar meaning, in my search after truth, I should overlook some of the richest fields of divine knowledge. Were I to confine myself to Christianity in looking after the plan of Providence, and the destiny of humanity, I should also fall far short of universality. Were I to exclude any one portion of natural activity from the divine drama, how then should I be able to defend myself? I know not. The broadest possible basis, therefore, have I taken, because no other basis is tenable. From the position which I have taken I cannot be dislodged, for there is no place to put me. I have already occupied all place. I have no outward, and no inward, for to me all is outward and inward together.

If, moreover, in this universal sweep of thought by which I have gathered all being into unity, I have given a prominent place in the drama of humanity to two extraordinary dispensations, Jewism and Christianity, it was not because my caprice or my partiality would have it so, but because Nature, God, Providence, had ordained it, and forced me by conviction to own it. Nor is it at all singular that it should be so. It would be more singular were it not so. Of all the animals that God has created two are supreme—Man and Woman, and to them all authority is given according to the universal law of subordination. In the progress of time man appropriates the earth to himself, and makes the brute creation retire, or subserve his pleasure. That two dispensations should be created upon a similar principle, and that these two should gather all other dispensations into their own fold, and finally themselves be regenerated by the universal law of justice and truth, is therefore so perfectly in harmony with universal fact, that I am surprised that it has not long ago been recognized as an axiom in philosophy, but still more surprised to think that I should be the first to proclaim it.

The principal reason which prevented men from seeing or acknowledging this truth, was probably the very narrow and sectarian aspect which Christianity has hitherto presented to the world. The old astronomy tended much to confine the imaginations of the faithful, and measure the designs of the almighty mind by the bushel of its own insignificant universe. Christianity was fixed and established during the reign of this Lilliputian philosophy, and the ridiculous idea of a hell in the interior of the earth, and a heaven in the upper sphere of celestial rotation, was consecrated by a long and uninterrupted course of popular acceptance. Taking revelation in its most obvious and literal sense, men had no doubt of the literal truth of this fearful absurdity. The reasonable meaning of revelation was always regarded as a heresy. The literal was most intelligible to the vulgar mind. The spiritual is too refined and elegant for uncultivated men, and as it was with such that all churches and all religions began, it is reasonable to suppose that revelation would address them according to the state of mind which is first developed, and not according to that which is the result of an inward effort to deliver the truth from the ore with which Nature invariably surrounds it.

This symbolical hell and heaven has been the most powerful fetter employed by Nature to keep down the idea of a uni-

versal system until the scientific and political worlds were prepared to receive it. The fetter is now rapidly yielding to the force of universal truth, and, as it yields, the minds of men open to receive more reasonable views of the divine proceedings.

I have little doubt, that although the views of Universalism taught in the *Shepherd* are to be found systematically laid down in no other work, yet the sum total of all religious opinions is that which I have taught. The conflict of public opinion unconsciously brings it out. It is simple Nature, and belongs to every man, but more especially when his feelings are wide and his benevolence unbounded, for then he feels as a member of the universal man, and not as a member of a little club or coterie, which appropriates all virtue to itself, and imputes all vice to its adversaries. In a large human assembly, composed of all sects and parties in the world, under no other influence than that of moral reciprocity, Universalism is the language which would unconsciously and undesignedly be spoken. A sectarian could not avow himself. An Infidel must conceal his peculiar sentiments. A Universalist would be nearest to all as the golden mean, and the sum total of all. So far from being new, Universalism is common to all, and is only concealed by the ore of sectarian creeds, and the rubbish of controversial extravagances.

The *Shepherd* has been principally theological, as I originally intended it should be, and in association with my own professional articles, I have freely admitted a quantity of other material, for which I do not consider myself responsible. I wish, if possible, to give every man an opportunity of speaking for himself; but more especially those men who have no representatives in the public press, who are either reviled and abused, or treated with ridicule as unworthy of serious and patient attention, or logical confutation. Upon this principle I admitted the letters on Animal Magnetism in the first volume, which excited considerable interest in many readers, and considerable indignation in others. Having promised, however, a fair opportunity to the writer of expounding the principles of the science, he went on freely without any interruption from me, because his facts I could not positively either assert or deny, and his theoretical principles of philosophy were so closely allied to my own, that I received considerable benefit from the perusal of his letters. But he was not unchecked, for Quizzicus kept an eye on him to the last. Upon Animal Magnetism I can say little positive. I wait for further discoveries to illuminate my mind, but I have no doubt that it is based on a series of natural phenomena, which are yet imperfectly understood, and which will hereafter either form the substance of a new science, or be incorporated with the generic science of physiology to which they belong.

My Mystic friends, in the third volume, belong to a very different school from any of my former associates. One has been a regular contributor. With him I have frequently contended, because he opposed me in principle. But the mystic is a peculiar race of men, and it is really difficult to determine how to treat with them: professing to follow feeling rather than intellect, they are more disposed to assert than to reason, and thus a controversial intercourse with them is hardly possible. I am so far satisfied, however, with the introduction of the Mystical letters into the third volume, that I have presented an opportunity of defining the mystic principles, and, at the same time, of satisfying my own friends, that I myself really am no mystic, but reason on the scientific basis. Every man is to a certain extent a mystic in feeling, especially in solitude, and every genuine moralist aims at nothing less than the development of a happy condition of inward experience, which is only the mystic's "divine nature;" but, in disowning the characteristic name of Mystic, I merely declare that my judgment teaches me to deal with the perceptible phenomena of material nature as the means whereby the conscious being is rendered either happy or miserable, good or evil, wise or foolish, so far as his nature is susceptible. You cannot teach a dog the science of astronomy, because it has not got the mind, but the mind being given by God as one *premise* to begin with, the other premise is the external apparatus of globes, charts, diagrams, &c. These are the two *poles* of scientific activity. The one is useless without the other. The mind is a blank

without a perceivable object, and the object is nothing without a mind to perceive it. After this manner I treat all other externalities, and hence, I conclude, that I am not what is generally called a mystic, but take a much broader and more universal basis. Having often been ridiculed as a man of the clouds, I am happy to show the men of *granite* that there are much more cloud-capt summits than mine in the world. Primrose-hill is not a mountain.

Having made these observations, I wish to part in peace with all. We have all preserved a personal friendship for each other to the last, and there is no probability of that friendship ever being much disturbed by contrariety of opinion, because there is always a large amount of sympathy which we can find amongst no other parties, and there are no fearful apprehensions of sulphurous vengeance for intellectual imperfections or moral imbecility. We all look with great composure on the warfare in which we are engaged, and are actuated more by an ardent zeal to promote the welfare of men, than a nervous dread of seeing them doomed to everlasting misery. Thus far we are all intellectually and spiritually redeemed, and, at the same time, prepared for employing kind instead of harsh measures for the amelioration of mankind. I include all my social and Owenian friends in this paragraph of peace; for, though there are points of great importance, upon which we differ, there are others of equal importance upon which we agree, and in which we are far in advance of the church and all sectarian Christians in genuine Christian principles.

A word upon contradictions, of which I have frequently been accused, but never specifically, so as to afford me an opportunity of reply. I believe those charges arise entirely or principally from contradiction in the mind of the accuser. Few people are aware of the first elementary axiom of all philosophy, namely, the twofold manifestation of truth. It has never been pointedly asserted heretofore by public teachers, and, although it is a universal fact, so very vague are popular notions respecting it, that people are apt to accuse a man of contradicting himself for declaring the whole truth, congratulating themselves on their own consistency, for rigidly adhering to a one-sided proposition. Take any common proverb for an illustration—thus, "virtue is the source of happiness," and its negative, "virtue is tortured by the exhibition of human depravity; it requires a man's feelings to be blunted to make life desirable." Both these are correct; the contradiction is a reconcilable contradiction, what I have called a sexual opposition. Again: "light is the source of vision;" its negative "darkness is the source of vision," is equally true; for light without shade or relative darkness, is merely a glare, and is tantamount to perfect blindness. I merely give these illustrations to point out the species of reply I would be most likely to make to a specific charge of contradiction, at the same time confessing that my habits of thinking necessarily lead me into this apparent contradiction, because I find it impossible to obtain a full front view of the face of truth by any other method.—I do not like profiles. Now, all doctrines hitherto taught are mere profiles of truth, and so much accustomed are men and women to the representations of truth with one eye, one ear, one cheek, and one nostril, that when any one presumes to draw her with two of each, they roar out "contradiction."

I have often thought that the day will yet come when all elementary principles of philosophy will be laid down in double columns like the Analytical Synopsis in the *Shepherd*. It appears to me almost indispensable, that some such definite mode of analysis be adopted; for men are so exceedingly prone to one-sidedness, that if you convince them of the truth of a proposition, they immediately set about the denial of its opposite, boasting loudly of their consistency. Nothing can be more absurd. It is a universal law, without an exception, that every positive has its negative, and wherever attraction does exist, there also is repulsion. I do not speak here of local facts, and temporary incidents, as whether a man was killed in Covent Garden yesterday, or a house was burned in the Strand, I speak of laws which are fixed and eternal—of truths the same yesterday, to-day, and for ever—of these laws and truths I say, they have a two-sided aspect, and, until that two-sided aspect be

fairly presented and acknowledged, what men call consistency is nothing but confusion, and what men frequently call contradiction, is a full and fair portrait of universal truth. I will give a specimen of contradictions, which are both positively and negatively true.

God is the author of evil.
God hates evil.
Evil is doomed to destruction.

God is not the author of evil.
God does not hate evil.
Evil is not doomed to destruction.

The wicked will be punished eternally.

The wicked will not be punished eternally.

The good and the evil will be separated for ever.

The good and the evil will never be separated.

The goodness of God is manifested in creation.

The severity of God is manifested in creation.

God loves the good, and hates the wicked.

God is no respecter of persons—time and chance happen to all.

Solidity is the strongest principle in Nature.

Solidity is the weakest principle in Nature.

Truth is more powerful than falsehood.

Falsehood is stronger than truth, and rules the world.

I leave the reader to continue these columns to any length he pleases, asserting only, that every universal proposition may be brought into the list with its negative along with it. A perfect mass of contradiction, and yet true! This is the *mannerism*, to use an artist's phrase, which I have adopted, in delineating truth. It is strictly in accordance with nature; and this is the answer I give to all who accuse me of contradiction—in general terms, without specifying a particular instance. At the same time I do not deny, that, in going into analytical detail, I may have committed many blunders; but these blunders can never prove subversive of the fundamental principles, which stand secure and irreversible on the rock of ages.

In treating of the consummation of all progress in the *beau ideal* of a system of social contentment, I have always felt that I had a peculiarly personal interest in it, for although I do not expect in this stage of being to see much amendment in our social condition, yet I feel myself to be a member of the *universal man*, and personally interested in his everlasting destiny. The low-minded views which Materialists entertain of the human being and his fate, are too degrading to the character of man to be regarded by me as in harmony with Nature; and, therefore, without presuming to determine how I shall personally experience the happiness which my imagination foresees, I never doubt that it is my destiny to enjoy it. I am none of those fantastic perfectibilians who can exult in the anticipation of the high state of moral and intellectual culture to which the human race shall have advanced when they are eternally annihilated. There may be a satisfaction experienced by such men in such anticipations, but the satisfaction is more verbal than real: mine is more real than verbal, for I anticipate my own individual participation of this future improvement and increased felicity. Had I not such a hope I should despise life. I would disdain to feed it. My pride would not suffer me to live on the same terms as a beast, to fulfil the same destiny at last. The doctrine that maintains such a destiny as this is low, and the people who attach themselves to it will sink to the level to which it is for ever doomed in the world of thought. High and noble thoughts will always attach themselves to a high destiny, and base thoughts, in spite of clamour and revolution, agitation and intimidation, will keep the people down to the level of their own poetry. High sentiments must always rule over low. There is a power even in profession independent of practice. When the practice and the profession are both of the highest order, it is vain for jealousy to wag her tongue against them. A high profession will cover a multitude of low practices, but a base profession will throw a cloak of profanity over many virtues. Is this a fact? Then let the people resolve that their profession and their practice shall be of the noblest order. In spite of chemistry and phrenology, the noblest is the truest and the best, and calculated above every other for effecting the salvation of the species.

Before closing the columns of the *Shepherd*, I think it necessary to mention the names of the principal contributors. I have not the authority of the gentlemen for doing so, but I believe they will have no objection to subscribe their names to their own productions. The principal contributor to the first volume was Dr. De Prati, the "Alpine Philosopher;" and, as much variety of opinion existed respecting his letters, I take the liberty of transcribing the following passage from Coleridge's "Table Talk," in which that great dialectician makes honourable mention of the correspondent of the *Shepherd*. "Nine years," says Coleridge, "has the subject of Zoo-Magnetism been before me. I have traced it historically; collected a mass of documents in French, German, Italian, and the Latinists of the sixteenth century; have never neglected an opportunity of questioning eye-witnesses, *ex. gr.*, Tieck, Treviranus, De Prati, Meyer, and others of literary or medical celebrity, and I remain where I was, and where the first perusal of Kluge's work had left me, without having moved an inch backward or forward. The reply of Treviranus, the famous botanist, to me when he was in London, is worth recording. 'I have seen what I am certain I would not have believed on your telling; and in all reason, therefore, I can neither expect nor wish that you should believe on mine.'"—*Table Talk*, vol. i. pp. 107, &c.

The "Transcendentalist" is a gentleman whom I have never personally met. For a long time I was not even aware of his name. I saw at once that he understood his subject, and I admitted his articles upon their merits alone. I soon after discovered that he was intimate with many of my personal friends. He is well known as a dramatic writer, is an excellent classical scholar, and intimately conversant with German philosophy. His name is Oxendorf. He promised us a concluding letter, with a list of philosophical axioms, but they have never arrived.

"The Mystic Student" is a Mr C. Lane, who I believe occasionally contributes to the *New Moral World*. He has been long connected with the press, and is better qualified than any man I know for delineating the peculiar views of the school to which he belongs.

These three are the principal contributors, and they can never be injured, either in literary or moral reputation, by this revelation of their authorship. There are other occasional Correspondents, whose position in society is somewhat more delicate and precarious. Their names I leave in the mist of sweet retirement. Having never formerly appeared as public writers, I leave it to posterity to discover what pens of future renown have made their *début* in the columns of the *Shepherd*.

A series of papers, entitled "Gallery of Pantheism," was commenced in the second volume, and never resumed in the third. I expected much satisfaction from these papers, but the author has been otherwise employed, and I can only express my regret that they were not continued.

The translator of Schiller's Letters disappeared for several months, and rendered that series also incomplete. The last letter is so far superior to the former, that I now feel sorry that we have been deprived of the remainder.

I now conclude the *Shepherd*, with as clear a conscience as I commenced, conscious of no insincerity or selfish motive in conducting it. Should I appear again as the conductor of a paper, I shall most probably change my costume, but I hope I shall always preserve my identity.—THE EDITOR.

I wish I had a list of errata to conclude with, and I have no other apology to make for the want of it than laziness or want of time, which are frequently synonymous, for one generally finds time for an agreeable employment. Now what on earth can be more disagreeable than searching after one's own blunders? Errors will creep into a weekly publication, in spite of the utmost vigilance, but more especially in an office where three publications are weekly sent to press, and where the final corrections are generally hurried through while the printer's truck is waiting in the street to take away the forms to the machine.

I will give a specimen of errata.—For "Gastineau," read "Gastineau," p. 98, 2nd col. For "sectarian opinions or fundamental theology," read "sectarian opinions on," &c., p. 218, 2nd col. For "it is their destiny to be shunned," read "it is their destiny to be shamed," p. 146, 2nd col. There is a little

confusion in page 98, arising from some hasty alterations before going to press, which cannot well be rectified. In page 290, Iris is said to have been commissioned by Jove to deceive Agamemnon—it was not Iris, but a nameless phantom.

TO CORRESPONDENTS.

There are several small articles in my possession, which I have not had an opportunity of inserting, and must trust to the indulgence of the writers for the apparent neglect. Several private letters also, not intended for insertion, have been received, and can only be answered by this general acknowledgment. Many are anxious to know if I have finally resolved to commence any other periodical upon similar principles, and when. I have not finally resolved, and even if I had, it would be folly to make a positive promise. It is probable, if I am in good health and spirits at the close of the summer season, that I may make another attempt; but if not, the old readers of the *Shepherd* can never be at a loss for a teacher, for the best of all teachers is within themselves, so soon as they have commenced the study of the works of God upon universal principles. Without doubt it is pleasing for a man of broad and liberal views to see a weekly periodical conducted upon a broad and liberal basis, and mortifying to think that the most comprehensive and sublime exhibitions of truth are those which find the smallest number of admirers and supporters; but this is a matter which concerns the feelings more than the understanding, for the views which the *Shepherd* has delineated of truth in general, are such as may be followed up by the simplest and most illiterate, as well as the most talented and learned. Wherever a man looks abroad on Nature's works, he sees the principles of universalism allegorically typified before him, and whether he merely survey the superficies of truth, or dive into its deepest and most sacred arcana, the same everlasting simple elements of thought are incessantly presented before him. Universal Nature is his teacher; he will never find an exception to the general rules, or at least only such an exception as will render the rule itself more conspicuous.

The volume has closed three months before I originally intended it, so that there are several small promises left unfulfilled. I should have learned from former experience not to make any promises; and thus save myself the humiliation of making apologies, but one has not always prudence at his right hand to direct him, and when prudence disappears for a few minutes, the left hand counsellor is sure to take advantage of the opportunity of proposing some of her own measures. The one helps to set off the other. They are the light and shade of character, and characters, like paintings, can have no existence without both. There is no painting or character composed of light alone, and even the very fairest lights are comparative shades. With these philosophical remarks I satisfy my own conscience, and the reader will never be responsible for my faults! Therefore all is well.

Requiescamus omnes in pace!

The Analytical Chart is printed on a fine sheet of royal paper, with explanatory notes and a border, and sold at Sixpence—on drawing paper, at One Shilling.

The *Shepherd* may be had at the publisher's, either in volumes or single numbers; and any mechanic's institution or reading association may receive, *gratis*, a whole copy well bound, by intimating to the publisher or Mr. Smith a desire to have it.
